

some considerable development in 1843 and 1844, when a competition was going on for the decoration of the new Houses of Parliament. Dyce and Maclise have left examples of uncommon mark in this line. (W. M. R.)

CARTWRIGHT, EDMUND, D.D., F.R.S. (1743–1823), inventor of the power-loom, was born at Marnham, Nottinghamshire, April 24, 1743, and educated at Wakefield grammar school. He began his academical studies at Oxford in University College, but in 1762 he was elected a demy of Magdalen College, where, in 1764, he succeeded to a fellowship. In 1770 he published *Amine and Elvira*, a legendary tale in verse, which passed through seven editions in little more than a year. It was followed in 1779 by *The Prince of Peace*, the best of his poetical productions. In 1779 he was presented to the rectory of Goadby Marwood, Leicestershire, to which was added a prebend in the Cathedral of Lincoln. He would probably have passed an obscure life as a country clergyman had not his attention been accidentally turned in 1784 to the possibility of applying machinery to weaving. The result was that he invented the power-loom, for which he took out a patent in 1785. At this period he removed to Doncaster, where he established a weaving and spinning factory, which proved a failure; and in 1796 he settled in London. His first power-loom was a rude contrivance, but he afterwards greatly improved it, and made it an almost perfect machine. The first mill on his plan, that of Messrs Grimshaws of Manchester, was wilfully destroyed by fire in 1791. In spite, however, of the opposition of the hand-weavers, the use of power-looms had in 1807 greatly increased; but as his patent was about to expire, this extraordinary mechanical genius would have derived no benefit from his invention, had not Parliament voted him a grant of £10,000 in consideration of his having contributed so largely to the commercial prosperity of the nation. Besides the power-loom Cartwright invented machines for combing wool and making ropes, and he was also the author of many improvements in the arts, manufactures, and agriculture. He passed his latter years on a farm he had purchased near Sevenoaks, Kent, where he died October 30, 1823. He was the younger brother of Major John Cartwright, the subject of the following notice.

CARTWRIGHT, JOHN (1740–1824), known as MAJOR CARTWRIGHT, one of the earliest and most honourable of English parliamentary reformers, was born at Marnham in Nottinghamshire, September 28, 1740. He received his education at Newark grammar school, and at Heath Academy in Yorkshire, and at the age of eighteen entered the navy. He was present, in his first year of service, at the capture of Cherbourg, and served in the following year in the action between Sir Edward Hawke and Admiral Conflans. Engaged afterwards under Sir Hugh Palliser and Admiral Byron on the Newfoundland station, he was appointed to act as chief magistrate of the settlement; and the duties of this post he discharged with singular uprightness and efficiency for five years. During this period he explored the interior of the island and discovered Lieutenant's Lake. Ill health necessitated his retirement from active service for a time in 1771. When the disputes with the American colonies began, he saw clearly that the colonists had right on their side, and warmly supported their cause. At the beginning of the war he was offered the appointment of first lieutenant to the duke of Cumberland, which would have put him on the path of certain promotion. But he declined to fight against the cause which he felt to be just, and thus nobly renounced the prospects of advancement in his profession. In 1774 he published his first plea on behalf of the colonists, entitled *American Independence the Glory and Interest of Great Britain*. In the ^{8th} year, when

the Nottinghamshire Militia was first raised, he was appointed major, and in this capacity he served for seventeen years. He was at last illegally superseded, because of his political opinions. In 1776 appeared his first work on reform in Parliament, which, with the exception of Earl Stanhope's pamphlets (1774), appears to have been the earliest publication on the subject. It was entitled, *Take your Choice*,—a second edition appearing under the new title of *The Legislative Rights of the Commonalty vindicated*. The task of his life was thenceforth chiefly the attainment of universal suffrage and annual Parliaments. In 1778 he was an unsuccessful candidate for the representation of Nottinghamshire; and the same year he conceived the project of a political association, which took shape in 1780 as the "Society for Constitutional Information," and which included among its members some of the most distinguished men of the day. From this society sprang the more famous "Corresponding Society." Major Cartwright, working unweariedly for the promotion of reform, published many pamphlets which it is needless to enumerate here, carried on a very extensive correspondence, and attended a great number of public meetings. He was one of the witnesses on the trial of his friends, Horne Tooke, Thelwall, and Hardy, in 1794, and was himself indicted for conspiracy in 1819. He was found guilty in the following year, and was condemned to pay a fine of £100. He married in 1780, and his wife survived him. He had no children. He took up his abode in London in 1810, settled in Burton Crescent in 1819, and there spent his last years. He was warmly loved by all who knew him personally; for, while the world looked chiefly at his inflexibility of political principle, his family and friends saw his unswerving integrity, his gentle-heartedness, his warm affections, his unvarying courtesy and rare simplicity of life. His health began to fail in 1823; and his spirits were greatly depressed at the same time both by public and private sorrows. The reverses in Spain and the execution of Riego touched him deeply, and more closely still the illness of a sister and the death of his brother, noticed above. He died in London, on the 23d September 1824. In 1826 appeared, in two volumes, *The Life and Correspondence of Major Cartwright*, edited by his niece, F. D. Cartwright. A complete list of his writings is included in this work. In 1831 a monument was erected to him in Burton Crescent, from a design by Macdowell.

CARTWRIGHT, THOMAS (c. 1535–1603), a Puritan divine, was born in Hertfordshire about the year 1535. He studied divinity at St John's College, Cambridge, but during the reign of Mary was compelled to adopt the legal profession. On the accession of Elizabeth, he resumed his theological studies, and was soon afterwards elected fellow of Trinity College. In 1570, he was appointed Margaret divinity professor; but Dr Whitgift, on becoming chancellor in 1571, deprived him of the post. This was a natural consequence of the use which he made of his position. He inveighed bitterly against the hierarchy. He attacked the Elizabethan theory of a state-controlled church, advocating, on the contrary, a church-controlled state, in which the presbyter was to enjoy a lofty authority, for his use of which he was to be responsible to God alone. He even taught that no opinions but his own were to be tolerated, and that heresy against them was a sin deserving of death. Immediately after this he removed to the Continent, and officiated as clergyman to the English residents, first at Antwerp and then at Middleburg. On his return he became still further embroiled with Dr Whitgift and the Government, on account of his *Admonition to Parliament*, which was full of the most violent attacks on the existing condition of church and state. In 1590 he was summoned before the Star Chamber and imprisoned, and in 1591 he

was once more committed to the Fleet by Aylmer, bishop of London. He was finally liberated in 1592 and allowed to preach, and the remaining eleven years of his life were undisturbed.

CARTWRIGHT, WILLIAM (1611–1643), an English poet, born at Northway near Tewkesbury, in September 1611, was the son of a gentleman, who, having wasted his fortune, was reduced to the necessity of keeping an inn. William Cartwright finished his education at Oxford, entered the church, and became a popular preacher in that university. In 1642 he obtained the place of successor in the church of Salisbury; and he was afterwards chosen junior proctor and metaphysical reader in his university. He died of camp fever at the age of thirty-two, in 1643. He was distinguished by a graceful person and attractive manner, and by extraordinary industry; and, indeed, his fame rests on his personal popularity and the praise which he received from his fellow-poets, and especially from Ben Jonson, rather than on the merit of his verses, which are, in fact, very ordinary productions. His poems and plays were published in 1651.

CARUPANO, a seaport town of Venezuela, South America, in the province of Cumana, 65 miles north-east of the town of that name. It is situated on the Caribbean Sea, at the opening of two valleys, and is defended by a fort. The chief trade is in horses and mules. Population 8600.

CARUS, KARL GUSTAV (1789–1869), a German physiologist and psychologist, was born at Leipsie, on the 3d January 1789. He was educated at the Thomas School and the university of his native city, and devoted his attention first to chemistry, intending to enter upon the business of his father, who had a large dyeing establishment. But a course of lectures on anatomy which he attended caused him to alter his views, and he began the systematic study of medicine. In 1811 he graduated, and began to teach as a *privat-docent*. The subject which he selected (comparative anatomy) had not previously been lectured on at Leipsie, and Carus soon established a reputation as a medical teacher. In 1813 he became director of the military hospital at Pfaffendorf, near Leipsie, and in the following year he was summoned as professor to the new medical college at Dresden. In this town he spent the remainder of his life, rising to the highest dignities of his profession. He was made royal physician in 1827, and became a privy councillor in 1862. The last years of his life were spent in drawing up an autobiography,—which was published under the title *Lebenserinnerungen und Denkwürdigkeiten*, four volumes, 1865–6. He died on the 28th July 1869. In philosophy Carus belongs to the school of Schelling, and his works are thoroughly impregnated with the spirit of that system. He was also distinguished as a landscape painter and as an art critic.

Carus's literary activity was very great, and the list of his works is lengthy. The most important are—*Grundzüge der vergleichende Anatomie und Physiologie*, 1828; *System der Physiologie*, 2d ed., 1847–9; *Psyche: zur Entwicklungsgeschichte der Seele*, 1846; *Physik: zur Geschichte des leiblichen Lebens; Natur und Idee*, 1861; *Symbolik des menschlichen Gestalts*, 1852; *Atlas der Kranioskopie*, 2d ed., 1864; *Vergleichende Psychologie*, 1866.

CARVAHAL, TOMAS JOSÉ GONSALEZ (1753–1834), a Spanish poet and statesman, was born at Seville in 1753. He studied at the University of Seville, and took the degree of LL.D. at Madrid. He obtained an office in the financial department of the Government; and, in 1795 was made intendant of the colonies which had just been founded in Sierra Morena and Andalusia. During 1809–1811, he held an intendency in the patriot army. He became, in 1812, director of the University of San Isidro; but, having offended the Government by establishing a chair of international law he was imprisoned for five years

(1815–1820). The revolution of 1820 reinstated him, but the counter-revolution of three years later forced him into exile. After four years he was allowed to return, and he died, in 1834, a member of the Supreme Council of War. Carvahal enjoyed European fame as author of metrical translations of the poetical books of the Bible. To fit himself for this work he commenced the study of Hebrew at the age of fifty-four. He also wrote other works in verse and prose, avowedly taking Luis de León as his model.

CARVIN, a town of France, in the department of Pas-de-Calais, 14½ miles E.S.E. of Béthune. It is a flourishing centre of industry, and carries on a large manufacture of beetroot sugar, alcohol, and starch. Population of the town in 1872, 5780, and of the commune, 7024.

CARVING. To carve (Anglo-Saxon, *ceorfan*) is to cut, whatever the material; in strict language carving is sculpture. The name of sculptor is commonly reserved for the great masters of the art, while that of carvers is given to the artists or workmen who execute subordinate decorations, e.g., of architecture in marble or stone. The word is also specially applied to sculpture in ivory and its substitutes, and in wood and other soft materials.

True ivory is the tusk of the elephant, but other inferior kinds are produced by the walrus, narwhal, and hippopotamus. Long before the art of metallurgy was generally known, among the remotest pre-historic races, carvings on ivory and on reindeer horn may be mentioned in evidence of the antiquity of this kind of art. A piece of mammoth ivory with a rude engraving of a mammoth is preserved in the Museum of the Jardin des Plantes in Paris. Fragments of ivory and horn, carved with excellent representations of animals, found in caves in the Dordogne in France, may be seen in the British Museum.

Coming to historic ages we find abundant evidence of the skill of the Egyptians in ivory carving. Two daggers inlaid and ornamented with ivory, in the British Museum, are attributed to the age of Moses. In the same collection are chairs of the 16th century B.C. inlaid with ivory; two boxes in the shape of waterfowl and a small figure may perhaps be attributed to the 11th. A number of carvings in ivory and bone of these and later dates are preserved in the Egyptian galleries of the Louvre in Paris (*Labarte, Arts Industriels*, p. 186).

Ivory is mentioned among the imports of Solomon (1000 B.C.) His throne of ivory overlaid with the purest gold, and the ivory house of King Ahab, are specially recorded; the words "ivory palaces" in the 45th psalm are more exactly rendered "wardrobes"—chests of wood ornamented with ivory. Horns, benches, and beds of ivory are mentioned in the prophetic books. Amongst the Hebrews, as amongst other ancient nations, sceptres, thrones, and other insignia of royalty are often spoken of as made of ivory. These objects were frequently inlaid with precious stones.

Mr Layard discovered many fragments of carved ivory in Nineveh, so brittle from desiccation that they were boiled in gelatine to enable them to be safely handled. The most interesting (dated by Mr Layard about 950 B.C.) are two small tablets representing seated figures of Egyptian character with a cartouche bearing hieroglyphics. Parts of the decoration were "enamelled with a blue substance let into the ivory" (rather with slices of coloured vitreous pastes, not true enamel), and the whole ground of the tablet was originally gilded, remains of the gold leaf still adhering to it (*Nineveh and its Remains*, ii. p. 9).

The Greeks made many precious objects in ivory even in the earliest times. Phidias and his successors (in the 5th century B.C.) made "chryselephantine" statues, i.e., of ivory and gold, and the practice was continued, probably, down to the Christian era. A great number of such statues

are described by Pausanias. The most celebrated were the colossal statue of Athene at Athens, nearly 40 feet, and that of Jupiter at Olympia, about 58 feet high. They were the largest and most precious works ever executed in the material under discussion. It has been stated by writers of various dates, from Pliny downwards, that the ancients had methods of flattening and joining ivory so as to make it cover large surfaces, but modern experiments of the recipes given have not verified these statements.

A few remains of ivory carvings found in Etruscan tombs in Italy are preserved in the British Museum; others have been collected by Signor Castellani. Roman ivories earlier than the 4th century are very rare. There are, however, in various collections in England and on the Continent carved ivory tablets, called consular diptychs, meant to fold up and to contain writing on the inside. They were used by the Roman consuls, and sometimes sent by them as presents to great personages. Half of one of the most beautiful of these works is preserved in the Kensington Museum (No. 212-65), the other half is in the Hotel de Cluny in Paris—this piece is of the 3d century. The chair of St Maximian, covered with ivory panels elaborately carved (6th century), is still in good preservation at Ravenna.

Ivory carving was carried on at Constantinople during the early Middle Ages. Charlemagne did much to encourage and establish the arts in Northern Europe. Ivory book-covers carved with Gospel subjects, pyxes, or small boxes for church use, caskets, horns, and other valuable objects were carved in ivory during his reign, and those of his immediate successors. They were set in gold or silver, and sometimes with precious stones. An example of Anglo-Saxon workmanship (10th century) is preserved in the Fitzwilliam Gallery in Cambridge. Combs both of ivory and bone of the Roman and Anglo-Saxon periods are not unfrequently found in tombs in England. Carved folding triptychs, shrines, and altar-pieces containing sacred subjects in bas-relief, or figures of saints, with rich and elaborate architectural details according to the style of the day, often decorated with gold and colour, were made in great numbers from the 10th to the 16th century, in most countries of Europe. Crucifixes and images of the Virgin and the saints, made during these ages, are often graceful and beautiful examples of small sculpture. To these should be added the pastoral staves carried by bishops and abbots, and numbers of objects for secular use, such as horns, combs, caskets, hilts of arms, and the like, carved in ivory for persons of wealth, throughout the Middle Ages. They reached their highest perfection during the 13th and 14th centuries. The religious subjects carved in ivory by Spanish artists were of great excellence before the 16th century.

The great sculptors of the Renaissance are credited, though often without sufficient authority, with many works in ivory still preserved in public galleries. The scholars of Cellini and Raphael certainly carved with great skill in this material. Examples attributed to the masters themselves are shown in the galleries of Munich and Vienna. Germany, Flanders, Holland, and Spain were distinguished for ivory carvers during the 16th century. Augsburg and Nuremberg were especially renowned in this respect. The carved drums of vases and tankards, bas-relief plaques or panels set in silver gilt and gold are to be seen in the galleries of Munich, Vienna, and Berlin. Dagger and knife hilts and sheaths, powder-flasks, and statuettes of admirable execution, continued to be made in ivory down to the middle of the 17th century. There are good examples in the Green Vaults in Dresden and in many other collections. Several German princes, as well as Peter the Great, carved and turned ivory in the lathe, and remark-

able specimens of their work may be seen in the Green Vaults.

Among the best Italian ivory carvers of the 16th century may be reckoned the pupils of Valerio Vicentino and Bernardo of Castel Bolognese. A fine bas-relief by Alessandro Algardi, of the 17th century, is preserved in the Basilica of St Peter in Rome. Other well-known artists were Copé and François Du Quesnoy, called the Fleming (1594-1644), the latter of great eminence; Jacob Zeller, a Dutchman; Leo Pronner of Nuremberg; Van Obstal of Antwerp, settled in France; Leonard Kern and Angermann of Nuremberg (17th century); Barthel (died at Dresden 1694), who excelled in carving animals; Leonard Zick of Nuremberg (17th and 18th centuries), who carved puzzle balls, like those of the Chinese; Stephan Zick, who carved eyes and ears, examples of which may be seen in the Green Vaults; Belthasar Permoser, a Bavarian settled in Dresden (1650-1732); and Simon Troger (18th century), a carver of great skill in ivory who added fanciful details in brown wood; examples of his compositions are preserved in the Kensington Museum, the Royal Museum of Turin, and the Green Vaults of Dresden.

Ivory-carving has long been cultivated in the East. In many parts of India, Bombay especially, ivory is carved, pierced, and inlaid with great skill. The Bombay carvers borrowed this art from the Persians. The Chinese carve slabs of ivory and entire tusks with elaborate compositions of figures and landscape. They carve and pierce puzzle balls, cut one inside another out of single pieces of ivory. The skill of the Japanese is still greater. Their groups of small figures, animals, shells, insects &c., show a power of representing animal life, and a dexterity in inlaying ivory with metals and other substances probably never surpassed. If the art of both nations is somewhat grotesque, their power of hand has had but few equals in ancient or in modern times.

A modern school of ivory carving, that has become a small trade, is established at Dieppe in France. Many crucifixes and religious images are produced there of considerable merit.

Implements and furniture have been carved in wood from very ancient times. The perishable nature of the material forbids the hope of finding remains of such remote antiquity as we have in ivory, bone, and horn. It cannot be doubted, however, that the weapons and utensils of the stone age were fitted to handles of wood and bound on with thongs of hide or animal sinews. Most ethnographical collections possess paddles and weapons made by more recent races in a primitive state of knowledge and cultivation. Often these utensils are diapered over in patterns of much elegance,—those, for instance, of Mexico, New Zealand, and Polynesia. The figure-head of a New Zealand canoe of brown wood carved in graceful convolutions, resembling the designs of the Scandinavian artists, was exhibited amongst the collections of the duke of Edinburgh.

Pausanias states that all the most ancient races carved statues out of wood, and mentions specially those of Egypt. According to Sir G. Wilkinson wooden statues continued to be erected in Egyptian temples till the times of the later Pharaohs. Sycamore was the wood in general use for furniture, and cedar for mummy cases, which are carved into the shape of the mummy, painted and gilt. Timber was imported into Egypt, and rare woods were inlaid both in furniture and statues (see Birch, *Trans. Roy. Soc.*, iii. p. 172). A bas-relief in hard wood, attributed to the 6th, 7th, or 8th dynasty (above 2000 years B.C.), is preserved in the Louvre.

The Hebrews of the age of Moses seem to have been more skilful as metallurgists than as wood carvers, but

under Solomon, the sanctuary of the temple was lined with cedar, and the walls elaborately carved with figures of cherubims, palm trees, and open flowers all gilt. Two cherubims, 10 cubits high were carved in olive, a very durable wood. Solomon imported ebony and other rare woods for his musical instruments and furniture.

Wood was used by the Greek sculptors before the 5th century B.C., and Pausanias enumerates many statues made of different woods, some of several kinds of wood extant in Greece in his time (bk. ii. and vii.)

The Romans, who used bronze and marble for their furniture in later times, were still curious in woods, which were carved or polished and reserved for many purposes, and when of fine grain were extravagantly valued. Tacitus speaks of the rude wooden idols of the Germans.

The fact that a great part of Europe was covered with oak, pine, and other forests made the use of timber universal during the Middle Ages; many memorials remain of the skill both of constructors and carvers in oak and other woods. Churches, houses, even entire cities were of timber; many of these remain in Northern Germany, e.g., in Hanover, Hildesheim, and Brunswick, in towns of Brittany and Perigord, and in Blois, Coventry, Chester, and other cities of France and England. Beam ends, brackets, door heads and gables were often effectively carved. Two doors, remains of churches in Norway (of the 11th or 12th century), entirely constructed of timber, carved in a large-grained pine wood into a complicated but graceful composition of dragons and serpents, were exhibited at South Kensington in 1868. The most elaborate and artistic carved work of the Middle Ages is to be found in the shrines or "retables" placed on altars, some of small chamber size, others 20 to 30 feet in height. They were made in countless numbers in Germany, Spain, France, Flanders, and England. The principal space of the shrine was filled by figures standing or seated under elaborate carved tabernacle work,—sometimes with complete pictorial compositions representing well-known legends of the saints. Generally these figures were gilded and painted. Often the shutters on the sides were painted with illustrative subjects, frequently painted on both sides, so as to be seen whether the shrine was open or shut. Many Lutheran churches in Nuremberg retain these ornaments exactly as they stood in Catholic times. The 15th and 16th centuries were prolific in these rich structures. A famous triptych by Hans Bruggemann (1515) is preserved in the cathedral of Schleswig, an earlier one by Michel Pacher of Brauneck at Wolfgang-sur-le-Lac near Ichel. To the triptychs should be added the stall work of the 14th, 15th, 16th centuries, as in the cathedrals of Cologne, Amiens, and Ulm, and in many English churches. Another class of carvings may be studied in the vast roofs, such as that of Westminster Hall; the roofs of many churches in Norfolk, and many halls in the old colleges and Tudor mansions are decorated with carved figures and heraldry.

In the 16th century the great cities of Italy—Rome, Florence, Venice, Milan, Ferrara, Urbino, and others—abounded in richly carved gilt and inlaid furniture, chairs, wardrobes, chests—such as contained bridal trousseaux—mirror frames, caskets, even bellows. They were of walnut, cypress, cedar, ebony, and other woods,—inlaid with ivory, agates, and ornaments of hammered silver. Rich and beautiful examples of such work are preserved in the museum at South Kensington, the Hotel de Cluny, the Kunst Kammer of Berlin, and other collections. The 16th century stall-work of many Venetian churches, the panel-work of the old rooms in the Louvre in Paris, the fire-places seen in many old 16th century palaces, specially that of the Palace of Justice in Bruges, are examples of admirable decorative carving on a large scale.

The Spanish wood-carvers during this period had a just celebrity. Their religious imagery is admirably designed, true to nature, and devotional, pathetic, and tender in expression. They coloured the figures up to nature, but nothing was lost in this process. The great Renaissance painters and masters of Germany practised wood-carving of great excellence. Wohlgemuth of Nuremberg, Albert Durer, Veit Stoss, Ludwig Krug, Peter Flotner, &c., carved classical subjects, portraits in medallions, delicate bas-reliefs on draught men made of box and other hard woods, which are to be seen in many collections. They carved as often in hone stone, and modelled medallions, statuettes, and minute busts in wax, sometimes coloured up to life.

A rilievo on hone stone by Albert Durer is preserved in the British Museum; others on wood in the united collections in Munich, on wood and hone stone by Lucas Kranach the painter in the Kunst Kammer, Berlin, on wood with the monogram of Hans Schaufin in the same collection, one attributed to Lucas Van Leyden the painter in the National Library, Paris. The Augsburg artists worked more generally in wood only. Rosary beads of box, $\frac{1}{2}$ to $\frac{3}{4}$ of an inch in diameter, some made to open, carved with minute figure subjects of great excellence, may be seen in South Kensington and in other collections. During the same period minute Scripture subjects were carved in box on crosses and small triptychs by the monks of Mount Athos, the imitators of the old Byzantine art.

In the 16th century curious minute works, entire compositions, were carved by Properzia de' Rossi in peach stones. One is preserved in the Museum of Turin. A cherry stone on which a "gloria" of saints is carved is preserved among the Florentine gems. Leo Pronner, already named, also carved microscopic work on cherry stones.

A carver of great skill, Grinling Gibbons (1650-1721), founded a school of decorative carving in England which survived till near the end of the last century. The facility of execution in carving soft woods for gilding, to make frames, carriages, and furniture was very great during the earlier years of the last century. The taste was best in Italy and most extravagant in France. A revival of classic taste began with the reign of Louis XVI., and at about the same time in England, influenced by the brothers Adam and by many excellent carvers of furniture and decorative wood-work.

The carvings of the mountain villagers in Switzerland and the Tyrol are spirited, and are well executed, with simple tools, generally in pine wood. What has been said of the Indians, Persians, Chinese, and Japanese regarding ivory-carving, applies equally to their skill in carving and inlaying wood.

In most countries of Europe the art has been much displaced in recent times by moulded work in various materials and by metal-casting.

CARVING AND GILDING being two operations which formerly were the most prominent features in the important industry of frame-making, the craftsmen who pursued the occupation were known as carvers and gilders. The terms still continue to be the recognized trade name of frame-making, although very little of the ornamentation of frame-work is now accomplished by carving, and a great deal of the so-called gilt ornament is produced without the use of gold. The trade has to do primarily with the frames of pictures, engravings, and mirrors, but many of the light decorative fittings of houses, finished in "composition" and gilt work, are also entrusted to the carver and gilder.

Fashion in picture frames, like all fashions, fluctuates greatly. Mouldings of the prevailing sizes and patterns are generally manufactured in special factories, and supplied in lengths to carvers and gilders ready for use. A large proportion of such mouldings, especially those of a cheaper and inferior quality, are made in Germany. What is distinctively known as a "German" moulding is a cheap imitation of gilt work made by lacquering over the surface of a white metallic foil. German artisans are also very successful in the preparation of imitation of veneers of rosewood, mahogany, walnut, and other ornamental woods. The more expensive mouldings are either in wood (such as oak or mahogany), in veneers of any expensive ornamental wood, or real gilt.

A brief outline of the method of making a gilt frame, enriched with composition ornaments, may be taken as a characteristic example of the operations of the frame-maker. The foundation of such a frame is soft pine wood, in which a moulding of the required size and section is roughly run. To prevent warping the moulding is, or ought to be, made from two pieces of wood glued together. The moulding is "whitened up," or prepared for gilding by covering it with repeated coatings of a mixture of finely-powdered whiting and size. When a sufficient thickness of the whitening mixture has been applied, the whole surface is carefully smoothed off with pumice-stone and glass-paper, care being taken to keep the angles and curves clear and sharp. Were a plain gilt moulding only desired, it would now be ready for gilding; but when the frame is to be enriched, it first receives the composition ornaments. Composition, or "compo," is a mixture of fine glue, white re-in, and linseed oil well boiled together, with as much roller and sifted whiting added as makes the whole into a doughy mass while hot. This composition is worked in a hot state into moulds of boxwood, and so pressed in as to take up every ornamental detail. On its removal from the mould all superfluous matter is trimmed away, and the ornament, while yet soft and plastic, is laid on the moulding, and fitting into all the curves, &c., is fixed with glue. The ornamental surface so prepared quickly sets and becomes very hard and brittle. When very large bold ornaments are wanted for frames of unusual size they are moulded in *papier mâché*. Two methods of laying on gold—oil gilding and water gilding—are practised, the former being used for frames broken up with enrichments. For oil-gilding the moulding is prepared with two coats of fine thin size, and afterwards it receives a coat of oil gold-size, which consists of a mixture of boiled linseed oil and ochre. When this gold-size is in a "tackey" or "sticky" condition, gold-leaf is laid on and carefully pressed over and into all parts of the surface; and when covered with a coat of finish-size, the gilding is complete. Water gilding is applied to plain mouldings and all considerable unbroken surfaces, and is finished either "matt" or burnished. For these styles of work the mouldings are properly sized, and after the size is dry the gold is laid on with water. Matt-work is protected with one or two coats of finish-size; but burnished gold is finished only by polishing with an agate burnisher,—no size or water being allowed to touch such surfaces. The mitring up of frames, the mounting and fitting up of paintings, engravings, &c., involve too many minor operations to be noticed here in detail; but these, with the cutting and fitting of glass, cleaning and repairing pictures and prints, and similar operations, all occupy the attention of the carver and gilder.

CARY, HENRY FRANCIS (1772-1844), translator of Dante, and miscellaneous writer, was born at Gibraltar, December 6, 1772. He was the son of a captain in the army, and was educated at Christ Church, Oxford, which he entered at the age of eighteen, having two years earlier

made his appearance as an author, in a volume of *Sonnets and Odes*. In 1796 he took his master's degree, and having entered the church was presented, in the following year, to the vicarage of Abbott's Bromley in Staffordshire. This benefice he held till his death. In 1800 he was also presented to the vicarage of Kingsbury in Warwickshire. While still at Christ Church he had devoted much time to the study of modern literature, not only English but French and Italian; and the fruits of his studies in these fields appeared in the notes to his translation of Dante, the work on which his reputation now chiefly rests. The version of the *Inferno* was published in 1805, together with the original text. The version of the whole *Divina Commedia* did not appear till 1814. It attracted little attention for some years. But when Coleridge, in his lectures at the Royal Institution spoke of it in terms of high praise, the world was persuaded to acknowledge its merits. It gradually took its place among "standard" works, and passed through four editions in the translator's lifetime. It has the great merits of accuracy, idiomatic vigour, and readableness, and, although many rivals have since appeared in the field, still holds its honourable place. Its blank verse, however, cannot represent the close woven texture and the stately music of the *terza rima* of the original. In 1824 Cary published a translation of *The Birds* of Aristophanes. Two years later he was appointed assistant-librarian in the British Museum, a post which he held for about eleven years. He resigned in consequence of being refused the appointment, in ordinary course on a vacancy, to the post of keeper of the printed books. From this time he applied himself to literary work on his own account, for which his duties at the museum had left him little opportunity. For the old *London Magazine* he wrote a series of *Lives of the early French Poets*, and *Lives of English Poets* (from Johnson to Henry Kirke White), the latter intended as a continuation of Johnson's *Lives of the Poets*. These works were published in a collected form in 1846. He was also engaged in editing the works of Cowper, Milton, Pope, and other poets. He published about 1834 a translation of the *Odes* of Pindar, and at the time of his death was preparing a body of illustrative notes for a new edition. A pension of £200 per annum was conferred on Cary by Lord Melbourne in 1841. He died in London, August 14, 1844, and his remains were interred in Westminster Abbey. A memoir of his life, with his literary journal and letters, was published in two volumes by his son, the Rev. Henry Cary, M.A., in 1847.

CARY, SIR LUCIUS, second Viscount Falkland, was born at Burford, co. Oxon, in 1610 or 1611, and educated at Trinity College, Dublin, his father being at that time lord-deputy of Ireland. On leaving the university he served for a short time in the Low Countries, but failing to attain promotion returned to England, and found a refuge from domestic troubles in the study of ancient literature and the society of the most eminent men of learning. Among his intimate associates were Jonson, Suckling, and Cowley; and at his country seat, Great Tew in Oxfordshire, he subsequently gathered around him a small group of theologians whose liberal opinions were not without influence in the religious rivalries of the day. In 1633 he succeeded to his father's title, and was appointed gentleman of the privy chamber to Charles I. In 1640 he entered the House of Commons as member for Newport, Isle of Wight, and quickly assumed there a prominent part upon the side of the king, while at the same time he supported Pym in his schemes of moderate reform in church and state, and himself introduced the Bill for the exclusion of bishops from the House of Peers. But having been chosen by Charles to be one of his secretaries of state,

Falkland found himself irretrievably committed to a cause which he could not wholly approve, and to the service of a king whom in his heart he distrusted, though his chivalry forbade him to abandon his cause. On the eve of the Civil War he joined his royal master at York, and having raised a troop of horse, did good service at Edgehill, Oxford, and the siege of Gloucester. In the indecisive battle of Newbury (20th September 1643) he fell fighting in the front rank of Lord Byron's regiment, with the words "Peace, Peace" upon his lips. Had his life been spared it is possible that he might at least have succeeded in mitigating the rancour of the contending parties. His poems and political writings, published after his death, do not increase a reputation which is based rather upon single-mindedness and patriotic self-devotion than upon his contributions to literature.

CARYL, JOSEPH (1602-1673), a learned Nonconformist clergyman, was born in London in 1602. He was educated at Exeter College, Oxford, and after leaving the university became preacher at Lincoln's Inn. By order of the Parliament he attended Charles I. in Holmby House, and in 1650 he was sent with Owen to accompany Cromwell to Scotland. After the Restoration he continued to officiate in an Independent congregation in London till his death in 1673. Caryl is now remembered only for his learned but ponderous commentary on Job, originally published in twelve volumes 4to, afterwards in two huge volumes folio.

CASA, GIOVANNI DELLA (1503-1556), an Italian poet, was born at Mugillo, in Tuscany, in 1503. He studied at Bologna, Florence, and Rome, and by his learning attracted the patronage of Alexander Farnese, who, as Pope Paul III., made him nuncio to Florence, where he received the honour of being elected a member of the celebrated academy, and then to Naples, where his oratorical ability brought him considerable success. His reward was the archbishopric of Benevento, and it was believed that it was only his openly licentious poem, *Capitoli del foro*, and the fact that the French court seemed to desire his elevation, which prevented him from being raised to a still higher dignity. He died in 1556. Casa is chiefly remarkable as the leader of a reaction in lyric poetry against the universal imitation of Petrarch, and as the originator of a style, which, if less soft and elegant, was more nervous and majestic than that which it replaced. His prose writings gained great reputation in their own day, and long afterwards, but are disfigured by apparent straining after effect, and by frequent puerility and circumlocution. The principal are—in Italian, the famous *Il Galateo*, a treatise on manners, which has been translated into several languages, and, in Latin, *De Officiis*, and translations from Thucydides, Plato, and Aristotle. A complete edition of his works was published at Florence in 1707, to which is prefixed a life by Casotti. The best edition is that of Venice, 1752.

CASA CALENTA, a town of Italy, in the province of Molise and district of Larino, about 18 miles north-east of Campobasso. It is situated in an agricultural district, and trades in silk, wine, and fruits. It is usually identified with the ancient *Calela*, where Fabius took up his station to watch Hannibal, when the latter established his quarters at *Gerunum*, now Gerione. Population, 6248.

CASALE, a town of northern Italy, in the north of the province of Alessandria. It is situated in a plain on the right bank of the Po, 38 miles east from Turin, and at a height of 249 feet above sea-level. Its fortress, founded in 1590, was strengthened and improved in 1849 under the direction of General de la Marmara. The town has been frequently besieged. It was taken from the Spaniards in 1640, and forty-one years later was sold to France by the duke of Mantua. It was taken in 1695, but was recovered from the allies by the French. Since then, it has been

twice retaken by the latter. Casale is the see of a bishop; and its cathedral, a Lombard structure, is said to have been founded in 742. The church of San Domenico, another fine edifice, consecrated in 1513, contains a monument of remarkably elegant design to the memory of the Palaeologi, erected in 1835. Other objects of interest are the churches of S. Ambrosio and of S. Ilario (once a pagan temple), the town-house, the clock-tower, and the library. The town also contains a college, theatre, and several palaces of the nobility. Some trade is done in fruit, wine, hemp, and the so-called "syrup of Casale." The principal manufacture is that of silk. Population, 27,514.

CASALMAGGIORE, a town of Italy in the province of Cremona, the capital of a circondario. It is situated on the left bank of the Po, and is protected from inundation by excellent embankments. Its public buildings comprise an abbey, a hospital, an orphan asylum, a custom-house, and a theatre; and its most important industries are the manufacture of glass, pottery, cream of tartar, and leather. It was the scene of a victory of Francesco Sforza over the Venetians in 1448. Population about 4500.

CASALPUSTERLENGO, a town of Italy, in the province of Milan, about 30 miles south-east of that city, on the River Brenbiolo. It carries on the manufacture of silk, linen, and earthenware, and is one of the chief seats of the trade in Parmesan cheese. Population, 6207.

CASANOVA DE SEINGALT, GIOVANNI JACOPO (1725-1803), one of the most noted adventurers of the 18th century, was born at Venice in 1725. His father belonged to an ancient and even noble family, but alienated his friends by embracing the dramatic profession early in life. He made a runaway marriage with Zanetta Farusi, the beautiful daughter of a Venetian shoemaker; and Giovanni was their eldest child. When he was but a year old, his parents, taking a journey to London, left him in charge of his grandmother, who perceiving his precocious and lively intellect, had him educated far above her means. At sixteen he passed his examination and entered the seminary of St Cyprian in Venice, from which he was expelled a short time afterwards for some scandalous and immoral conduct, which would have cost him his liberty, had not his mother managed somehow to procure him a situation in the household of the Cardinal Acquaviva. He made but a short stay, however, in that prelate's establishment, all restraint being irksome to his wayward disposition, and took to travelling. Then began that existence of adventure and intrigue which only ended with his death. He visited Rome, Naples, Corfu, Constantinople, and penetrated even so far as St Petersburg, where he was introduced to Catherine II. By turns journalist, preacher, abbé, diplomatist, he was nothing very long, except *homme à bonnes fortunes*, which profession he assiduously cultivated till the end of his days. In 1755 having returned to Venice, he was denounced to the Government as a political spy, and committed to prison. After several fruitless attempts he succeeded in establishing a communication with another prisoner, in whose company he made his escape on the night of the 31st of October 1756. This exploit, afterwards so graphically related by him in a separate volume, and also in his *Memoirs*, gained him great celebrity. From that day he became a man of fashion, and recommenced his life of dissolute and profligate adventure. Exhibiting his effrontery and audacity at every court in Europe, he at last made his way through Germany, in which country he was presented to Frederick the Great, into France. Here he became acquainted with Rousseau, Voltaire, and many more notabilities, had interviews with Louis XV., and was almost tenderly intimate with Madame de Pompadour. Handsome, witty, and eloquent, it is not to be wondered at that such a man should have been received

with open arms in the dissolute coteries of the 18th century. Consummate profligate and charlatan as he was, he was loaded with honours by the Italian princes, and even decorated by the Pope himself.

After eighteen years' absence from his native town, he endeavoured to reinstate himself in the esteem of the Venetians by a refutation of the work of Amelot de la Houssaye on the constitution of the republic; and when at last serious matters took the place of his pleasures, he became, in 1782, librarian to a German prince without a library. This prince was Count Waldstein, whom he accompanied to his chateau at Dux in Bohemia, in which place he died in 1803, after having written his *Memoirs*, a work not unlike the *Confessions* of Rousseau, but far more depraved in tone. They are the frank avowal of a godless life, notwithstanding the frequent professions of Christianity in the preface. Much as they have been overrated, a certain literary merit cannot be denied to them. They are principally interesting for the faithful pictures they give us of the morals and manners of the times. The *Mémoires* were published at Leipsic, 10 vols., in 1828-38, and at Paris, 4 vols., in 1843. He also wrote several works on history in Italian; *Récit de ma Captivité*, 1788; a translation in verse of the *Iliad*, 1778; and a *Narrative of Eighty Years spent among the Inhabitants of the Interior of the Globe*, 1788-1800.

CASAS GRANDES (i.e., in Spanish, Great Houses), a town of Mexico, in the province of Chihuahua, situated on the Casas Grandes or San Miguel River, about 35 miles S. of Llanos and 150 miles N.W. of the city of Chihuahua. It is celebrated for the ruins of early Mexican buildings still extant, about half a mile from its present site. They are built of "sun-dried blocks of mud and gravel, about 22 inches thick, and of irregular length, generally about 3 feet, probably formed and dried *in situ*." The walls are in some places about 5 feet thick, and they seem to have been plastered both inside and outside. The principal edifice extends 800 feet from N. to S. and 200 E. to W.; its general outline is rectangular, and it appears to have consisted of three separate piles united by galleries or lines of lower buildings. The exact plan of the whole has not as yet been made out, but the apartments have evidently varied in size from mere closets to extensive courts. The walls still stand at many of the angles with a height of from 40 to 50 feet, and indicate an original elevation of several stories, perhaps six or seven. At a distance of about 450 feet from the main building are the substructions of a smaller edifice, consisting of a series of rooms ranged round a square court, so that there are seven to each side besides a larger apartment at each corner. The whole district of Casas Grandes is further studded with artificial mounds, from which are excavated from time to time large numbers of stone axes, *metates* or corn-grinders, and earthen vessels of various kinds. These last have a white or reddish ground, with ornamentation in blue, red, brown or black, and are of much better manufacture than the modern pottery of the country. Similar ruins to those of Casas Grandes exist near the Gila, the Salinas, and the Colorado, and it is probable that they are all the erections of one people. Squier is disposed to assign them to the Moquis.

See vol. iv. of *The Notice Books of the Pacific States of North America*, by Spain, whose principal authorities are the *Noticias del Estado de Chihuahua* of Escudero, who visited the ruins in 1819; an article in the first volume of the *Album Mexicana*, the author of which was at Casas Grandes in 1842; and the *Personal Narrative* of Mr. Bartlett, who explored the locality in 1851.

CASABON, ISAAC (1559-1614), was born at Geneva, 15th February 1559, of French refugee parents. On the publication of the edict of January 1561, the family returned to France and settled at Cr  t in Dauphin  , where

Arnold Casaubon, Isaac's father, became minister of a Huguenot congregation. Till he was nineteen, Isaac had no other instruction than what could be given him by his father amid the distractions of those troubled years. Arnold was away from home whole years together, in the Calvinist camp, or the family were flying to the hills to hide from the fanatical bands of armed Catholics who patrolled the country. Thus it was in a cave in the mountains of Dauphin   that Isaac received his first lesson in Greek, the text-book being *Isocrates ad Demonicum*.

At nineteen Isaac was sent to the Academy of Geneva, where he read Greek under Francis Portus, a native of Crete. Portus died in 1581, having recommended Casaubon, then only twenty-two, as his successor. At Geneva he remained as professor of Greek till 1596. Here he married twice, his second wife being Florence, daughter of the celebrated scholar-printer, Henri Estienne. Here, without the stimulus of example or encouragement, with few books and no assistance, in a city peopled with religious refugees, and struggling for life against the troops of the Catholic dukes of Savoy, Casaubon made himself the consummate Greek scholar, and master of ancient learning, which he became. He gave himself up to a study of the classical remains with a zeal and persistency which were fed only by an innate love of acquisition. His great wants were books and the sympathy of learned associates, both of which were wanting at Geneva. He spent all he could save out of his small salary in buying books, and in having copies made of such classics as were not then in print. Henri Estienne, Beza, and Lect were, indeed, men of superior learning. But Henri, in those last years of his life, was no longer the Estienne of the *Thesaurus*; was, besides, never at home, and would not suffer his son-in-law to enter his library. "He guards his books," writes Casaubon, "as the griffins in India do their gold!" Beza was engrossed by the cares of administration, and retained, at most, an interest for theological reading. Lect, a lawyer, had left classics for the active business of the council. The sympathy and help which Casaubon's native city could not afford him, he endeavoured to supply by cultivating the acquaintance of the learned of other countries. Geneva, as the metropolis of Calvinism, received a constant succession of visitors. The Continental tour of the young Englishman of birth was not complete without a visit to Geneva. It was there that Casaubon made the acquaintance of young Henry Wotton, who lodged in his house, and borrowed his money. Of more consequence to Isaac Casaubon was the acquaintance of Richard Thomson of Clare, for it was through Thomson that the attention of Scaliger, settled in 1593 at Leyden, was directed to Casaubon. Scaliger and Casaubon first exchanged letters in 1594. Their intercourse, which was wholly by letter, for they never met, passes through the stages of civility, admiration, esteem, regard, and culminates in a tone of the tenderest affection and mutual confidence. Influential French men of letters, the Protestant Bongars, the Catholic De Thou, and the Catholic convert Canaye de Fresne, aided him by presents of books and encouragement, and endeavoured to get him invited, in some capacity, to France.

This was effected in 1596, in which year Casaubon accepted an invitation to the university of Montpellier, with the title of "conseiller du roi" and "professeur stipendi   aux langues et bonnes lettres." In Montpellier he never took root. He held the professorship there only three years, with several prolonged absences. He was not, at any time, insensible to the attractions of teaching, and his lectures at Montpellier were followed not only by the students, but by men of mature age and position. But the love of knowledge was gradually growing upon him,

and becoming a devouring passion which excluded all other ambition. He began to perceive that the editing Greek books was an employment more congenial to his peculiar powers than teaching. At Geneva he had first tried his hand in some notes on Diogenes Laertius and on Theocritus, of small account. His *début* as an editor had been a complete Strabo (1587), of which he was so ashamed afterwards that he apologized for its crudity to Scaliger, calling it "a miscarriage." This was followed by the text of Polyænus, an *editio princeps*, 1589; a text of Aristotle, 1590; and a few notes contributed to Estienne's editions of Dionysius of Halicarnassus and Pliny's *Epistolæ*. It is not till we come to his edition of Theophrastus's *Characteres*, 1592, that we have a specimen of that peculiar style of illustrative commentary, at once apposite and profuse, which distinguishes Casaubon among annotators. At the time of his removal to Montpellier he was engaged upon what is the capital work of his life, his edition of, and commentary on, Athenæus.

In 1598 we find Casaubon at Lyons, superintending the passage of his *Athenæus* through the press. Here he lived in the house of De Vie, "surintendant de la justice," a Catholic, but a man of acquirements, whose connections were with the circle of liberal Catholics in Paris. In the suite of De Vie, Casaubon made a flying visit to Paris, and was presented to Henry IV. The king was very gracious, and said something about employing Casaubon's services in the "restoration" of the fallen university of Paris.

With the hopes thus excited he returned to Montpellier. In January 1599 he received a summons to repair to Paris. But the terms of the letter missive were so vague, that, though it bore the sign manual, Casaubon hesitated to act upon it. However, he resigned his chair at Montpellier, but instead of hastening to Paris, he lingered more than a year at Lyons, in De Vie's house, waiting for the appointment to a Paris professorship. None came, but instead there came a summons from De Vie, who was in Paris, to come to him in all haste on an affair of importance. The business proved to be the Fontainebleau Conference. Casaubon allowed himself to be persuaded to sit as one of the referees who were to adjudicate on the challenge sent to Du Plessis Mornay by Cardinal Duperron. By so doing he placed himself in a false position, as Scaliger said: "Non debbat Casaubon interesse colloquio Plessiæano; erat asinus inter simias, doctus inter imperitos" (*Scaligerana* 2^a). The issue was so contrived that the Protestant party could not but be pronounced to be in the wrong. By concurring in the decision, which was unfavourable to Du Plessis Mornay, Casaubon lent the prestige of his name to a court whose verdict would without him have been worthless, and confirmed the suspicions already current among the Reformed churches that, like his friend and patron Canaye de Fresne, he was meditating abjuration. From this time forward he became the object of the hopes and fears of the two religious parties; the Catholics lavishing promises, and plying him with arguments; the Reformed ministers insinuating that he was preparing to forsake a losing cause, and only biggling about his price. We now know enough of Casaubon's mental history to know how erroneous were these computations of his motives. But, at the time, it was not possible for the immediate parties to the bitter controversy to understand the intermediate position between Genevan Calvinism and Ultramontanism to which Casaubon's reading of the fathers had conducted him.

Meantime the efforts of De Thou and the liberal Catholics to retain him in Paris were successful. The king repeated his invitation to Casaubon to settle in the capital, and assigned him a pension. No more was said about the university. The recent reform of the university

of Paris had closed its doors to all but Catholics; and though the chairs of the Collège de France were not governed by the statutes of the university, public opinion ran so violently against heresy, that Henry IV. dared not appoint a Calvinist to a chair, even if he had desired to do so. But it was designed that Casaubon should succeed to the post of sub-librarian of the royal library when it should become vacant, and a patent of the reversion was made out in his favour. In November 1604, Jean Gosselin died in extreme old age; and Casaubon succeeded him as sub-librarian, with a salary of 400 livres in addition to his pension.

In Paris Casaubon remained till 1610. These ten years were the brightest period of his life. He had attained the reputation of being, after Scaliger, the most learned man of the age,—an age in which learning formed the sole standard of literary merit. He was placed above penury, though not in easy circumstances. He had such facilities for religious worship as a Huguenot could have, though he had to go out of the city to Habbon, and afterwards to Charenton, for them. He enjoyed the society of men of learning, or who took an interest in learned publications. He had the best opportunities of seeing men of letters from foreign countries as they passed through Paris. Above all, he had wealth of Greek books, both printed and in MS., the want of which he had felt painfully at Geneva and Montpellier, and which no other place but Paris could at that period have supplied.

In spite of all these advantages we find Casaubon restless, and ever framing schemes for leaving Paris, and settling elsewhere. It was known that he was open to offers, and offers came to him from various quarters,—from Nîmes, from Heidelberg, from Sedan. His friends Leet and Diodati wished, rather than hoped, to get him back to Geneva. The causes of Casaubon's discomfort in Paris were various, but the principal source of uneasiness lay in his religion. The life of any Huguenot in Paris was hardly secure in these years, for it was doubtful if the police of the city was strong enough to protect them against any sudden uprising of the fanatical mob, always ready to reenact the St Bartholomew. But Casaubon was exposed to persecution of another sort. Ever since the Fontainebleau Conference an impression prevailed that he was wavering. It was known that he rejected the *outré* anti-papery opinions current in the Reformed churches; that he read the fathers, and wished for a church after the pattern of the primitive ages. He was given to understand that he could have a professorship only by recantation. When it was found that he could not be bought, he was plied by controversy. Henry IV., who liked Casaubon personally, made a point of getting him to follow his own example. By the king's orders Duperron was untiring in his efforts to convert him. Casaubon's knowledge of the fathers was that of a scholar; Duperron's that of an adroit polemist; and the scholar was driven to admit that the polemist was often too hard for him. These encounters mostly took place in the king's library, over which the cardinal, in his capacity of aumonier, exercised some kind of authority; and it was therefore impossible for Casaubon to avoid them. On the other hand the Huguenot theologians, and especially Du Moulin, chief pastor of the church of Paris, accused him of conceding too much, and of having departed already from the lines of strict Calvinistic orthodoxy.

When the assassination of Henry IV. gave full rein to the Ultramontane party at court, the obsessions of Duperron became more importunate, and even menacing. It was now that Casaubon began to listen to overtures which had been faintly made before, from the bishops and the court of England. In October 1610 he came to this country in the suite of the ambassador, Lord Wotton of Marley. He

had the most flattering reception from James I., who was perpetually sending for him, to have theological talk. The English bishops were equally delighted to find that the great French scholar was an Anglican ready made, and had arrived, by independent study of the fathers, at the very *via media* between Puritanism and Romanism, which was becoming the fashion in the English Church. Casaubon, though a layman, was collated to a prebendal stall in Canterbury, and had a pension of £300 a year assigned him from the exchequer. Nor were these merely paper figures. When Sir Julius Cæsar made a difficulty about payment, James sent a note in his own hand: "Chancellor of my exchequer, I will have Mr Casaubon paid before me, my wife, and my barnes." He still retained his appointments in France, and his office as librarian. He had obtained leave of absence for a visit to England, and his permanent settlement here was not contemplated. In order to retain their hold upon him, the Government of the queen regent refused to allow his library to be sent over. It required a special request from James himself to get leave for Madame Casaubon to bring him a part of his most necessary books. Casaubon continued to speak of himself as the servant of the regent, and to declare his readiness to return when summoned to do so.

Meanwhile his situation in London gradually developed unforeseen sources of discomfort. Not that he had any reason to complain of his patrons, the king and the bishops. James continued to the last to delight in his company, and to be as liberal as the state of his finances allowed. Overal had received him and his whole family into the deanery of St Paul's, and entertained him there for a year. Overal and Andrewes, then bishop of Ely, were the most learned men of a generation in which extensive reading was more general among the higher clergy than it has ever been since. These two were attracted to Casaubon by congenial studies and opinions. With the witty and learned bishop of Ely, in particular, Casaubon was always happy to spend such hours as he had to spare from the labours of the study. Andrewes took him to Cambridge, where he met the most gratifying reception from the notabilities of the university. They went on together to Downham, where Casaubon spent six weeks of the summer of 1611. In 1613 he was taken to Oxford by Sir H. Savile, where, amid the homage and feasting of which he was the object, his principal interest is for the MSS. treasures of the Bodleian. The honorary degree which was offered him he declined.

But these distinctions were far from compensating the serious inconveniences of his position. Having been taken up by the king and the bishops, he had to share in their rising unpopularity. The courtiers looked with a jealous eye on a pensioner who enjoyed frequent opportunities of taking James I. on his weak side—his love of book talk,—opportunities which they would have known how to use. Casaubon was especially mortified by Sir H. Wotton's persistent avoidance of him, so inconsistent with their former intimacy. His windows were broken by the roughs at night, his children pelted in the streets by day. On one occasion he himself appeared at Theobald's with a black eye, having received a blow from some ruffian's fist in the street. Mr Hallam thinks that he had "become personally unpopular;" but these outrages from the vulgar seem to have arisen solely from the Cockney's antipathy to the Frenchman. Casaubon, though he could make shift to read an English book, could not speak English, any more than Mme. Casaubon. This deficiency not only exposed him to insult and fraud, but restricted his social intercourse. It excluded him altogether from the circle of the "wits;" either this or some other cause prevented him from being acceptable in the circle of the lay learned—the "antiquaries."

Camden he saw but once or twice. Casaubon had been imprudent enough to correct Camden's Greek, and it is possible that the ex-headmaster of Westminster kept himself aloof in silent resentment of Casaubon's superior learning. With Cotton and Spelman he was slightly acquainted. Of Selden we find no mention. Though Sir Henry Savile ostensibly patronized him, yet Casaubon could not help suspecting that it was Savile who secretly prompted an attempt by Montagu to forestall Casaubon's book on Baronius. Besides the jealousy of the natives, Casaubon had now to suffer the open attacks of the Jesuit pamphleteers. They had spared him as long as there were hopes of getting him over. The prohibition was taken off, now that he was committed to Anglicanism. Not only Endæmon-Joannes, Rosweyde, and Scioppinus, but a respectable writer, friendly to Casaubon, Schott of Antwerp, gave currency to the insinuation that Casaubon had sold his conscience for English gold.

But the most serious cause of discomfort in his English residence was that his time was no longer his own. He was perpetually being summoned out of town to one or other of James's hunting residences that the king might enjoy his talk. He had come over from Paris in search of leisure, and found that a new claim on his time was established. The king and the bishops wanted to employ his pen in their literary warfare against Rome. They compelled him to write first one, then a second, pamphlet on the subject of the day,—the royal supremacy. At last, ashamed of thus misappropriating Casaubon's stores of learning, they set him upon a refutation of the *Annals* of Baronius, then in the full tide of its credit and success. Upon this task Casaubon spent his remaining strength and life. He died in great suffering, 1st July 1614. His complaint was an organic and congenital malformation of the bladder; but his end was hastened by an unhealthy life of over-study, and latterly by his anxiety to acquit himself creditably in his criticism on Baronius. He was buried in Westminster Abbey. The monument, by which his name is there commemorated, was erected many years later by his friend Thomas Morton, then (1632) become bishop of Durham.

Besides the editions of ancient authors which have been mentioned, Casaubon published with commentaries Persius, Suetonius, the *Scriptores Historiæ Augustæ*. Polybius, on which he had spent vast labour, he left unfinished. His most ambitious work was his revision of the text of Athenæus, with commentary. The Theophrastus perhaps exhibits his most characteristic excellencies as a commentator. The *Exercitationes in Baronium* are but a fragment of the massive criticism which he contemplated, and failed in bringing before the reader the uncritical character of Baronius's history. His correspondence (in Latin) was finally collected by D'Almeloveen (Rotterdam, 1709), who prefixed to the letters a careful life of Isaac Casaubon. But this learned Dutch editor was only acquainted with Casaubon's diary in extract. This diary *Ephemerides*, of which the MS. is preserved in the chapter library of Canterbury, was printed in 1850, by the Clarendon Press. It forms the most valuable record we possess of the daily life of a scholar, or man of letters, of the 16th century.

For a characteristic of Casaubon's labours as a commentator and critic, a detailed account of his life, and a chronological list of his publications, the reader is referred to a work by the writer of the present article, *Isaac Casaubon* (1559-1614), 8vo, Lond., 1875.

(M. P.)
CASBIN, KASVIN, KAZBIN, a city of Persia, in the province of Irak, in 36° 12' N. lat. and 49° 53' E. long., and 108 miles W.N.W. of Teheran. It is built in a fertile plain, south of Mount Elburz, and is square in form, and surrounded by a wall of brick, with towers. Its extent is

greater than that of Teheran; but the place has been repeatedly shaken by earthquakes, and many of the streets are in ruins, as are most of the magnificent buildings seen here by Chardin in 1674. The most remarkable remains are the palace of the Sufi princes, and the mosque, with its large dome. The city is said to have been founded in the 4th century. In the 16th century Shah Tamasp made it the capital; and it remained so till Shah Abbas the Great transferred the seat of government to Ispahan. The town still bears the name of *Dar-el-Sultanet*, or the "seat of royalty." The dust and heat of the place are very oppressive; it is furnished, however, with baths, and with cisterns fed by underground canals. The system of irrigation formerly carried on by these canals or *kanauts* rendered the Plain of Casbin one of the most productive regions of Persia. They are now mostly choked up, except in the immediate vicinity of the city. The manufactures of Casbin are velvet, brocades, carpets, a kind of coarse cotton-cloth termed *kerbas*, and sword-blades. The trade of the city is still considerable; great quantities of rice, and of silk for Baghdad and India, are brought to it from the Caspian provinces; and the bazaars are large. Casbin is also of some military importance, lying as it does at the entrance of the defile which leads into Ghilan. It is the birthplace of the poet Lokman, and of the geographer Ham el Oullah. Population in 1868 estimated at 25,000.

CASCIANO DEI BAGNI, a village of Italy in the province of Siena and district of Montepulciano, in the valley of the Paglia. It possesses warm mineral springs, and its bathing establishments attract a large number of visitors. Population, 3585.

CASERTA, the capital of the district of Terra di Lavoro, in the province of Naples, and an episcopal see. It is situated on a rich alluvial plain, and has nearly 30,000 inhabitants. Caserta is mainly noticeable for its huge palace built by Vunvitelli for Charles III., which has a reputation that most architectural judges would probably deem to be superior to its merits. It is one of the stock sights for visitors to Naples, and has for many years served to but little other purpose. The length of the south front is stated to be 780 feet, the height 125 feet, and the number of windows in each floor 37; and such details as these best express the merits of a pile, which is in truth a monument of vulgar ostentation and wasted wealth. The harmony of the design is praised, and the building in truth possesses that easily-attained harmony which results from perfect symmetry. The travertine of which it is built was brought from the quarries of St Jorio, near Capua. The great staircase, gorgeously lined with *lumachello* marble from Trapani, has, however, some originality of conception and merit of design and execution. Besides all the usual appurtenances of a palace, including a chapel gorgeous with lapis-lazuli and gilding, the building contains a theatre, with, as the visitor is told, forty boxes, besides that of the royal family. The palace is at present wholly useless, and serves only to lay an additional burden on the king of Italy's civil list, which is charged with the maintenance of so vast a number of now unneeded palaces, the heritage of all the sovereigns he has superseded. The gardens, adorned with numerous cascades and much decorative sculpture after the old Italian fashion, are perhaps better worthy of mention than the palace. They are extensive and command some fine points of view. The "English garden" was made by Queen Caroline in 1782. The property was bought by Charles III. from the dukes of Sermoneta, and the palace was begun in 1752. Caserta Vecchia—old Caserta—was situated on the hills behind the modern town. It was built by the Lombards, as is said, in the 8th century, and some remains of its old walls and bastions may still be seen.

CASHAN, or KASHAN, a city of Persia, in the province of Irak, 92 miles north of Ispahan, in a dry and stony plain, in 33° 52' N. lat. and 51° 20' E. long. The city is said to have been founded by Zobeide, wife of Haroun el Raschid. The manufactures are silk-brocades, carpets, cottons, gold and silver articles, and copper kettles. The city has a palace, many fine mosques, bazaars, and caravanseries. At the foot of the neighbouring hills, four miles away, are the villa and beautiful gardens of Feen, the scene of the official murder, 9th January 1852, of Amiru'n-Nizam, one of the ablest ministers that Persia has had in modern times. The chief pavilion of the villa is in the form of a kiosk, with a projecting portico in front. The interior is decorated with fine arabesques. The vicinity of Cashan is famous for its scorpions. The city suffered from an earthquake in 1853. Population, 25,000.

CASHEL, an inland city of Ireland, in the county of Tipperary, 108 miles south-west from Dublin, and within 5 miles of the Great Southern and Western Railway. The town, which lies at the base of the Rock of Cashel, consists for the most part of a wide and well-built main street, and contains several public buildings, such as a court-house, a market-house, a fever hospital, barracks, and an infirmary. There are also the new cathedral, the deanery house (once the bishop's palace), and a Roman Catholic church, while immediately outside the town there is the union workhouse. Formerly an archiepiscopal see, Cashel was reduced in 1833 to a bishopric, but the bishop does not now reside there. The town's revenue is derived from landed estates in the neighbourhood, the gift of Bishop Manianus. It formerly returned one member to Parliament, but was disfranchised in 1870. Population in 1851, 4798, and in 1871, 4562.

The Rock of Cashel is the object of chief interest in the place. This elevation of limestone formation rises abruptly from the plain to a height of about 300 feet, and is a commanding object for many miles around. Its summit is occupied by the most interesting assemblage of ruins in Ireland, consisting of the remains of St Patrick's Cathedral, a round tower, Cormack's Chapel, and an ancient cross. The chapel, which is said to have been erected by King Cormack McCarthy in the 12th century, is considered to be the oldest stone edifice in the country. In its style it combines the high stone roof with the richest Norman decoration. The cathedral is cruciform in its design, and contains many interesting sculptures and tombs. In the adjoining cemetery there stands, on a rude pedestal, the "Cross of Cashel," with an effigy of St Patrick sculptured on its side. The round tower, situated at the north-east angle of the cathedral, rises about 90 feet, with a circumference of 58 feet, and unlike the neighbouring ruins has been built not of the limestone of the "Rock" but of freestone.

The history of Cashel belongs to the early period of Irish chronology. A stronghold in the time of Brian Boroihme it afterwards became noteworthy as the place where Henry II. received the homage of O'Brien, king of Limerick, and still later, where Edward Bruce held his Irish parliament. The cathedral was burnt in 1495 by the earl of Kildare. Two other interesting ruins exist at the base of the Rock, viz., Horn Abbey, founded in the 13th century, and the Dominican Priory, belonging to the same period.

CASHEW NUT, the fruit of the Cashew, *Cadju*, or *Acajon* tree, *Anacardium occidentale* (Nat. Ord. *Anacardiaceae*), a native of the West Indian Islands. The fruit is kidney-shaped, about an inch in length, and the kernel is enclosed in two coverings, the outer of which is smooth, grey, and leathery. Inside this external rind is a dark-coloured layer, containing an excessively acrid juice. The kernels have a bland, oily, pleasant taste. They are much eaten, both raw and roasted, in the tropical regions in which the tree is cultivated, and they yield a light-coloured.

of the melting of the snows passes into these channels, and tends to keep them open; so that when the inundation is over, the sea again flows into them. But along the intervening part of the coast, the channels, like the intervening hillocks, are not continuous, but form chains of little lakes, separated by sandy isthmuses. Although these channels run nearly parallel to each other, yet they have a somewhat fan-like arrangement; their centre of radiation being the higher part of the isthmus which separates the basin of the Caspian from the north-east portion of the Black Sea, —a fact, as will be seen hereafter, of no small significance. The coast-line of the Bay of Mertvy Kultuk, on the other hand, is formed by a chain of low calcareous hills, constituting the rampart of the plateau of Ust Urt or Turkoman Isthmus, which divides the Caspian from the Sea of Aral; and it is between head-lands of this high plain that the long extension of this bay termed the Karasn (or Black Water) runs inland, the town of Novo Alexandrovsk being situated near its entrance.

The northern basin of the Caspian may be considered to terminate on the west side with the Bay of Kuma, and on the east with the hilly peninsula of Mangishlak, on which the town of Novo Petrovsk is situated. To the south of the line joining these points, in the parallel of $44^{\circ} 10' N.$ lat., the western shore-line is higher, and the water deepens considerably,—thus forming the *middle* basin of the Caspian, which may be considered to extend as far south as Cape Apsheron, the south-eastern termination of the great Caucasian range. This middle basin receives the large river Terek, which discharges itself by several mouths (some of them entering the Bay of Kuma) through an alluvial delta; and several smaller streams flow into it from the slopes of the Caucasian mountains through the low plain which intervenes between their base and the border of the Caspian. Near the most considerable of these, the Kabir Yalanua, a rocky spur of the Caucasus comes down nearly to the sea; and a narrow pass is thus formed, which has been fortified from very ancient times, being formerly known as the *Albania* or *Caspian Pylæ*, and now as the Pass of Derbend, this being a small town built on the declivity in which the range terminates. The eastern shore of this portion of the Caspian is formed by the plateau of Ust Urt, or “high plain,” a very remarkable plateau from 550 to 727 feet above the level of the Caspian, which extends from its eastern shore to the sea of Aral, rising abruptly from both seas, and ranging about 400 miles in the north and south direction; its north and south borders are formed by a precipitous face or cliff, which has much the appearance of an ancient sea-margin. As it is composed of later Tertiary strata, its elevation must have occurred at a time not geologically remote. The headlands of the Ust Urt form an abrupt coast-line along the northern part of the eastern border of the middle basin, with occasional bays into which several small streams from the plateau discharge themselves. Further south, however, the plateau recedes, and the land shelves off more gradually; and here an extensive but shallow basin presents itself (of which more will presently be said) almost entirely cut off from that of the Caspian, termed the Karaboghaz, or Black Gulf. To the south of this the coast-line rises again; and a peninsula is formed by an extension of the Balkan Mountains, which may be considered as forming the southern termination of the middle basin. Except along the shore-lines, the depth of this basin everywhere exceeds that of the northern,—being greatest in its middle portion, where over a small area it reaches 400 fathoms, whilst it shallows again towards the south, where there is a sort of ridge between Cape Apsheron and the Balkan peninsula, at the average depth of 30 fathoms, that separates it from the southern basin.

The *southern* basin ranges from the Balkan Peninsula on the east and Cape Apsheron on the west to the shore-line formed by the base of the great Elburz range of mountains, which curves round its low and swampy border, from the mouth of the Kur to Astrabad, at an average distance of about 40 miles, rising in the peak of Sawalan near Tabreez to 15,800 feet, and in the snow-capped summit of Demavend, on whose southern slope Teheran is situated, to 18,600 feet. These mountains are composed of granite and porphyry, and are covered with recent volcanic deposits. South of Cape Apsheron, this basin receives the large river Kur, which drains the southern slopes of the Caucasian range; and this is joined, at no great distance from its mouth, by another large river, the Aras or Arax (the ancient *Araxes*), which forms the boundary between Russian Trans-Caucasia and Persia. The joint channel discharges its water by several mouths, part of them opening into the Gulf of Kizil-Agatch, which is the most considerable extension of the southern basin. From the mouths of the Kur to the Gulf of Enzeli, which resembles the Karaboghaz on a smaller scale, there is no considerable stream; but not far to the east of the town of Reshd of which Enzeli is the port, the Sefid or White River discharges itself, this being formed by the confluence of the Kizil-Uzen with another considerable river, the two together draining a large portion of the slopes of the western division of the Elburz range, and of its extension towards the Caucasus. The southern border of the Caspian, between the mouth of the Sefid and Astrabad, receives numerous small streams from the northern slopes of the Elburz, but no considerable river; the Bay of Astrabad, however, receives at its northern end the Attruk, a river of considerable importance, which drains an extensive valley enclosed by the mountain ranges that form the southern border of the desert plains of Khiva. On the eastern coast, opposite to the Gulf of Kizil-Agatch, are the Balkan Bay and the Adji-Bojur Bay, which lie between extensions of the Balkan Mountains. One or both of these bays, it may now be pretty confidently stated, formerly received the mouths of the ancient *Oxus* (now Amou-Daria), when it discharged itself into the Caspian, instead of into the Sea of Aral; and there is further reason to believe that a communication here at one time existed between the Caspian and the Sea of Aral, through a furrow which lies along the southern border of the Ust Urt, and which terminates in what was formerly known as the Gulf of Aboughir, a southern extension of Lake Aral now dried up. The depth of the southern basin of the Caspian is for the most part considerable, ranging in its central portion between 300 and 500 fathoms.

Drainage Area.—The drainage-area of the Caspian is much more extensive on the north and west than on the east and south. The Volga is estimated to drain an area of 527,500 square miles, and the Ural an area of 85,000 square miles,—these two rivers together probably bringing down more water than the Danube and the Don pour into the Black Sea. When to these we add the Kuma, the Terek, the Arax and Kur, the Sefid, and the Attruk, it is obvious that the total amount of river water annually discharged into the basin of the Caspian must be almost, if not quite, the equal of that which is discharged into the basin of the Black Sea. Yet the whole amount of fresh water returned by rain and rivers to the basin of the Caspian is only sufficient to compensate for the loss by evaporation from its surface,—as is shown by the fact that its present level remains constant, or, if it changes at all, rather sinks than rises. Now that the level of the Caspian was formerly about the same as that of the Black Sea, although at present 84 feet below it, is shown by the erosion of the rocks that formed the original sea-shore of

the southern basin, which, at the height of from 65 to 80 feet above the present level, have been furrowed out into tooth-shaped points and needles; and if the water were again to rise to that level, it would overflow many hundred thousand square miles of the southern steppes, extending the area of the basin as far as Saratov. Now supposing the Caspian to have been formerly in communication with the general oceanic area (which will be hereafter shown to be almost a certainty), a reduction of its level and a contraction of its area would follow as a necessary consequence, whenever that communication was cut off. For, as the evaporation-area would have then been much greater than it is at present, whilst the drainage-area would have been the same, there must have been a great excess of loss by evaporation over the water returned by rain and rivers; and this excess, producing a reduction of level, would have reduced the area of the northern shallow portion, until it contracted itself within its present limits. That this reduction was rapid, is indicated by two sets of facts;—first, the absence of any erosion of rocks between the level of the old erosion and the present level; and second, the fan-like arrangement of the *limans* and intervening *bugors* on the north-west shore, which makes it difficult to suppose that these channels can have been formed except by the furrowing of the soft soil during the sinking of the water, corresponding to that which is seen on a small scale on the muddy banks of a reservoir in which the water is being rapidly lowered by the opening of a sluice-gate.

Salinity of the Water of the Caspian.—It might have been anticipated that such a reduction in the volume of the Caspian water as must have taken place in this lowering of its level, would have shown itself (as in the Dead Sea) in an increase of its salinity; whereas the fact is that the proportion of salt in the water of the Caspian, though varying in different parts of the basin, and also at different seasons, is generally much less than the proportion in oceanic and even in Black Sea water.

In the northern portion, whose shallowness causes the enormous amount of fresh water brought down by the Volga, the Ural, and the Terek to exert the greatest diluting influence, the salinity is so slight (especially when the ordinary volume of these rivers is augmented by the melting of the snows) that the water is drinkable, its specific gravity not being higher than 1.0016. In the central and southern basins, on the other hand, which contain a body of salt water too large to be thus affected, the salinity is stated by Von Baer to be about one-third that of ordinary sea-water, the average sp. gr. being about 1.009. This reduction from what may be presumed to have been its original amount seems fully explained by Von Baer, who traces it to the number of shallow lagoons with which the basin is surrounded, every one of them being a sort of natural salt-pan for the evaporation of the water and the deposit of its saline matter in the solid form. The process may be well studied in the neighbourhood of Novo Petrovsk, where what was formerly a bay is now divided into a large number of basins presenting every degree of saline concentration. One of these still occasionally receives water from the sea, and has deposited on its banks only a thin layer of salt; a second, likewise full of water, has its bottom covered by a thick crust of rose-coloured crystals like a pavement of marble; a third exhibits a compact mass of salt, on which are pools of water whose surface is more than a yard below the level of the sea; and a fourth has lost all its water by evaporation, the stratum of salt left behind being now covered with sand. A similar concentration is taking place in the Karasu; for notwithstanding the proximity of the mouths of the Ural and Volga, the proportion of salt there rises to such a degree (the sp.

gr. being 1.057) that animal life is almost, if not entirely, suppressed. In the Peninsula of Apsheron, again, there are ten salt lakes, from one of which 10,000 tons of salt are annually obtained.

This process of elimination goes on, however, upon its greatest scale in the Karaboghaz, whose nearly circular shallow basin, about 90 miles across, is almost entirely cut off from the Caspian by a long narrow spit of land, communicating with it by a channel which is not more than about 150 yards broad and 5 feet deep. Through this channel a current is stated by Von Baer to be continually running inwards (during the summer months, at least) at an average rate of three miles per hour; this rate being accelerated by westerly and retarded by easterly winds, but never flowing at less than a mile and a half per hour. The navigators of the Caspian, and the Turkoman nomads who wander on its shores, struck with the constant and unswerving course of this current, have supposed that its waters pass down into a subterranean abyss, through which they reach either the Persian Gulf or the Black Sea,—an hypothesis for which there is not the least foundation, and which is directly negatived by comparison of levels. The current is really due to the indraught produced by the excess of evaporation from the surface of the basin, which is exposed to every wind and to intense summer heat, and which receives very little return from streams. The small depth of the bar seems to prevent the return of a counter-current of highly saline water, such as, in the Strait of Gibraltar, keeps down the salinity of the Mediterranean (see MEDITERRANEAN), none such having been detected by the careful investigations of Von Baer. And thus there is a progressively increasing concentration of the contents of the basin of the Karaboghaz, so that seals which used to frequent it are no longer found there, and its borders are entirely destitute of vegetation. Layers of salt are being deposited on the mud at the bottom; and the sounding-line, when scarcely out of the water, is covered with saline crystals. Taking the lowest estimates of the salinity of the Caspian water, of the width and depth of the channel, and of the speed of the current, Von Baer has shown that the Karaboghaz daily withdraws from the Caspian the enormous quantity of 350,000 tons of salt.

Now, if such an elevation of the bar were to take place as should cut off the basin of the Karaboghaz from that of the Caspian, the former would quickly diminish in extent, and the concentration of its waters would cause an increased deposit of salt to take place on its bottom. According to the proportion between the evaporation from the area so reduced and the return of fresh water by rain and streams, the Karaboghaz would either be converted into a shallow lake of extremely salt water, or into a salt marsh, or might altogether dry up and disappear, leaving behind it a thick bed of "rock-salt" resembling the deposits contained in the Saliferous strata of various geological periods. These several conditions all obtain at the present time in different parts of the great area of the steppes of Southern Russia. There are several small salt lakes which receive water enough from rain, snow, and streams to compensate for the loss they sustain by evaporation; these especially occur in the Kirghiz steppes, which lie to the north-east of Astrakhan, between the Volga and the Mongodjar Hills that form the southern extremity of the Ural range; the most notable of them being Lake Elton, which lies about 200 miles to the north of the present border of the Caspian, and from which large quantities of salt are annually procured. There are large tracts of these steppes, again, which are alternately muddy and white with salt, according as they are moistened by rain or dried up by the heat of the sun; one of these, lying between Lake Elton and the River Ural, occupies a

depressed area about 79 feet below the present level of the Caspian, and more than 160 feet below that of the Black Sea. Everywhere the sand of these steppes contains an admixture of salt; and there are various local accumulations of salt, often associated with marl, having shells and fish-bones imbedded in them, and thus clearly marking the sites of lakes which survived for a time the reduction of level and recession of the northern border of the Caspian, but which are now entirely dried up.

Climate of the Caspian.—The temperature of the Caspian area is remarkable for its wide range, both geographical and seasonal,—the difference between the mean winter temperatures of its northern and southern extremities being very great, whilst over its whole extent a high summer temperature prevails. The January isotherm of 15° skirts its northern border; that of 20° crosses it at the line of division between its northern and middle basins; that of 30° crosses it between its middle and its southern portions; and that of 40° skirts its southern border. Thus between the mean winter temperatures of the northern and southern extremities of the Caspian there is a *geographical range* of 25°. These means, however, do not indicate the extremely low temperatures which prevail over the whole region of the steppes during the prevalence of north-east winds; the thermometer then sinking to -20°, or even lower, on the level areas, whilst on the elevated plateau of Ust Urt a temperature of -30° is nothing remarkable.¹ The July isotherm of 75°, again, crosses the middle basin of the Caspian, nearly coinciding with the January isotherm of 25°; and that of 80° skirts the southern border of the sea, nearly coinciding with the January isotherm of 40°; so that the *mean annual range* is 50° over the northern portion of the basin, and 40° at its southern extremity. These summer means give no truer indication than the winter means of the extremes of temperature occasionally reached; thus Major Wood saw the thermometer mark 110° in the shade on the bank of the Oxus, recalling to his recollection the intense heat of Amesly Bay in the Abyssinian expedition.

The shallow northern basin of the Caspian is frozen during the entire winter, and the ice sometimes extends to the middle basin; the deep southern basin on the other hand, is never frozen over.

The prevalent winds of the Caspian are the south-east, which usually blow between October and March, and the north or north-west, which are common between July and September. They sometimes continue with great violence for days together, rendering navigation dangerous, and inundating the shores, wherever these are low and flat, against which they blow. The same cause tends to disturb the general level of the water, which is raised or lowered by from 4 to 8 feet at the north or the south end of the basin, according to the direction of the wind; and when this changes suddenly, as it often does, strong currents are generated. There are no perceptible tides in the Caspian; and the changes of level occasionally observed without any wind to account for them seem attributable on the one hand to inequality between the evaporation and the return of water by rain and rivers, and on the other to differences in atmospheric pressure between one part of the area and another, such as after the level of the Baltic (see *BALTIC*). It was stated by Colonel Monteith (*Royal Geographical Journal*, vol. iii.), that during his residence in that part of Asia from 1811 to 1828, the Caspian, "as well as every other lake in Persia, had sensibly decreased in depth;" but according to the information given him by the inhabitants of Enzeli, there is a rise and fall of several feet in periods of thirty years; and Von Baer, by whom the question was

carefully examined, could not obtain an evidence that any continuous reduction of level is at present in progress. There is indeed reason to believe that the level of the Caspian was once much *lower* than it is at present; for at Derbend, whose foundation is assigned to Alexander, masonry has been ascertained to exist at a depth of 50 feet below the present surface level; and as it is recorded that the Khorasmians made an offer to Alexander to conduct his army to Colehis, it would seem as if the ridge at the southern end of what is now the middle basin could then have been crossed dry-shod. This does not appear very improbable, if, as ancient geographers and historians explicitly state, the Volga flowed in their time, not into the Caspian, but into the Sea of Azoff,—a condition which seems to have persisted as late as the 5th century. The channel of its lower part would then have been that of the present River Don, which at one part approaches so closely to that of the Volga, that the two are united by a canal of less than 50 miles' length.

Fauna of the Caspian.—The animal life of this inland sea presents a remarkable admixture of marine and fresh-water types. The presence of seals and herrings seems an unmistakable indication of its former communication with the ocean,—and this rather northwards with the Polar Sea than westwards through the Black Sea and Mediterranean. Again, the Caspian abounds in salmon, a fish that may be considered essentially marine, though resorting to rivers to breed. And among its most notable and valuable inhabitants are four species of *Sturionidae*—the sturgeon, the sterlet, the sevriouga, and the beluga—which are essentially estuary fish, ascending rivers from their mouths. The fisheries are extremely valuable,—a very large amount of fish being salted for transmission to distant parts, while the *Sturionidae* afford the principal supply of caviare (prepared from their roe) and of isinglass (their swim-bladders cut into strips) for the whole world. The Molluscan fauna is not by any means proportionally numerous or varied. It principally consists of these widespread marine forms which are able to adapt themselves to a variety of conditions, and especially to a reduction in the salinity of the waters they inhabit, which (as in the parallel case of the Baltic) tends to dwarf the races of mollusks subjected to it.

Naphtha and Petroleum Springs.—Various parts of the shore of the Caspian abound in naphtha and petroleum. This is especially the case with the Peninsula of Apsheron, and with the Island of Tehilehon or Naphthalia, which lies near the opposite coast, off the Bay of Balkan. The whole soil of Apsheron is said to be saturated with naphtha, which rises wherever a hole is bored; and round the town of Bakn there are nearly a hundred bituminous springs, from many of which considerable supplies of naphtha are drawn. Some of these are constantly burning; and one of them, termed the "burning field," was formerly a celebrated "shrine of grace" to the Ghebers or Parsees, multitudes of pilgrims resorting to it, as Mahometans do to Mecca.

Former Extent of the Caspian.—From what has been stated, there can be no reasonable doubt (1) that the area of the Caspian must have formerly been much more extensive than at present, and (2) that it must at some time have had free communication with the ocean. It was long since pointed out by Pallas that the presence of salt lakes, dry saline deposits, and sea shells of the same species as those now inhabiting the Caspian, over a very large extent of the steppes to the east, north, and west of the present basin, can only be accounted for on such an hypothesis; and he traced out what may probably be regarded as a northern shore-line, along the base of the Mongodjar hills. Further, the fauna of the Caspian corresponds so remarkably with that of the Black Sea on the one side, and with

¹ It was here that the expedition of Perofsky, in 1839-40, lost all but 200 of its 12,800 camels.

that of the Sea of Aral on the other, that it can scarcely be doubted they were formerly in free communication with one other; and the lines of this communication can be pretty certainly traced out by the peculiar lowness of the levels. Thus between the Caspian and the Black Sea, or rather the Sea of Azoff, it would have lain across the low-lying portion of the steppe, which is at present a receptacle for the drainage of the surrounding area, forming the long and shallow Lake Manytsch. And between the Caspian and the Aral Sea it probably followed both the northern and the southern borders of the Ust Urt, which would have thus formed an insulated platform. If the elevation of level were sufficiently great to raise the water in Lake Aral to the height which it had in former times (as is shown by various clearly discernible landmarks), it would have overflowed a large area to the south also; and of this again, some parts of the coast-line are traceable. A very slight further elevation would bring it into communication with the Arctic Sea.

There is much to support this view, not only in the writings of ancient geographers and in the incidental notices which have been gleaned from the records of early travel, but also in the physical relations of the three basins now forming separate seas. For if the outlet of the Bosphorus were closed, the progressive accumulation of the excess of fresh water which at present escapes from the Black Sea by that channel (see BLACK SEA), would in no long time cause an overflow into the basin of the Caspian; since, although the Black Sea proper is separated from the southern portion of the Caspian by the mountainous region of the Caucasus, yet between the Sea of Azoff and the northern portion of the Caspian there is only the low steppe inhabited by the Don Cossacks and the Kalinuks; and, according to Major Wood, an elevation of the Black Sea to no more than 23 feet above its present level would cause it to overflow into the basin of the Caspian by the line of the Manytsch. The continuance of such an overflow would in time raise the Caspian to the same level, and would thus produce (as already shown) an immense extension of its area. For although that area would be prevented by the interposition of the Ust Urt from directly spreading towards the Sea of Aral, yet a continued rise of the Caspian would enable its water to find its way along the north and south of that plateau, so as to extend itself over a large part of the Aralo-Caspian depression, including what is now the isolated Sea of Aral, and completely surrounding the Ust Urt, which would rise as an island in the midst of it. A rise of 158 feet above the sea would bring it up to the level of the Sea of Aral; and it is considered by Major Wood that a further rise of about 62 feet, making 220 feet in all, of which there is distinct evidence in horizontal water-marks, would cause this Asiatic Mediterranean to overflow its northern boundary into the watershed of the Tobol, one of the tributaries of the Obi, through which its water would be discharged into Polar Sea. And it is a fact of no little interest, that the existence of such a communication between the Aralo-Caspian basin and the Northern Ocean was most distinctly affirmed by Strabo and other ancient geographers.

Now, as there is strong reason to suspect, from the evidence of recent volcanic change in that locality, that the opening of the Bosphorus took place within a period which, geologically speaking, was very recent, it does not seem at all improbable that this event (which some writers identify with the deluge of Deucalion) was the commencement of a series of changes, by which the "Asiatic Mediterranean" came to be divided into the three separate basins which now constitute its "survivals." Supposing, then, the level and extent of this great inland sea to have been formerly such as just described, the effect of the

opening of the Bosphorus would of course be to lower its surface and to contract its area. So long as the Caspian retained its communication with the Black Sea, it would remain at the general oceanic level,—the excess of the river drainage into the western basin (including that of the Volga) supplying what was deficient in the eastern. But if, by a slight elevation of the intervening isthmus, this communication were cut off, the excess of evaporation over the Caspian area (which would have been previously separated from the Aral Sea) would have reduced its level all the more rapidly, when the Volga, which now furnishes its principal supply, was not one of its affluents; and we can thus account for that depression of its surface much below its present level, which seems to have existed in the time of Alexander. By the subsequent deflection of the lower part of the Volga from the Sea of Azoff into the basin of the Caspian, the level of the latter would have been raised again, and its area extended, until that equality came to be established between the evaporation-loss and the river-supply which obtains at the present time.

The changes produced in the eastern portion of the "Asiatic Mediterranean" by the opening of the Bosphorus would have been yet more considerable. In consequence of the greater elevation of the Aralian area, a comparatively slight reduction of level would have served to lay dry a large proportion of it, and to cut off all communication with the Caspian except by a narrow outlet; and the maintenance of the level in what thenceforth existed as an isolated basin would depend upon the relation between its evaporation and its river-supply. This supply is mainly derived from two principal rivers:—the Syr Darya (the ancient *Jaxartes*), which takes its rise in the high valleys to the east of Kokand, flows through that khanate in a westerly direction, and now, after passing Khojend, turns suddenly northwards, and then to the north-west, and finally discharges itself into the Sea of Aral near its northern extremity; and the Amou Darya (the ancient *Oxus*), which rises in the plateau of Pamir and the high valleys of the Hindu Kush—its sources being in close proximity to those of the Indus,—and then, rapidly descending into the great Turcoman Plain, at present continues onwards in a north-west direction to Khiva, after passing which it flows into the southern end of the Aral Sea. A large proportion of the water of both these rivers, however, is withdrawn from them in the latter part of their course,—partly by percolation through the sandy soil (there being no defined river-beds), and partly through the extensive irrigation by which the dwellers along their course render productive the otherwise barren land. The supply which they bring to the existing Aral Sea does not suffice to keep it up to its present level, as is proved by recent exact observation; and it is clear, therefore, that even the whole body of water they bring down could not have maintained the level of the far larger area over which it must have originally spread, and that this must consequently have been rapidly reduced. Now there is very distinct evidence, both historical and physical, that the Oxus, within a comparatively recent period, flowed westwards across the desert of Khwarezm, near the parallel of 39° N., and discharged itself into the Caspian basin through the Balkan Bay. And there is also much reason to believe that the Syr Darya also, or a considerable part of it, once flowed westwards where it now takes its northerly bend, crossed the desert of Kizzel Koom, and finding its way into the Uzboy furrow which skirts the southern border of the Ust Urt, poured its water into the Caspian. Thus the area now occupied by the Aral Sea, deprived of its two main affluents, must either have entirely dried up, or have been reduced to a salt marsh, until a change in their course filled its basin to somewhat above its present level.

Thus it would appear that the condition of the Aralo-Caspian area must have undergone very considerable alterations within the historic period; and it is maintained by Major Wood (*The Shores of Lake Aral*, 1876)—who has recently investigated the whole subject both physically and historically,—that these alterations may have taken place without any such geological disturbances as some physical geographers have supposed necessary. Some of these changes, he argues, may be fairly attributed to human agency, which can be shown to have exerted a considerable influence, not only on the amount of water carried along by the two great rivers of the Aralian area, but even, it is probable, on their course.

But the hypothesis of an Asiatic Mediterranean will not of itself account for the facts which indicate that its basin was formerly in free communication with the general oceanic area. For as the water of this great inland sea must have risen to 220 feet above its present level, to have escaped across the ridge that formed its northern boundary, into the watershed of the Obi, only an outward or overflow current could have passed that ridge, and no sea-water could have entered the basin from the outside. Hence the saltness, not only of the water of the Caspian and Aral seas, but of that of the numerous lakes still remaining in the most depressed spots formerly covered by the Asiatic Mediterranean, together with the large admixture of salt in the sand that covers what is now its dried-up bed, can only be accounted for on the supposition that this Asiatic Mediterranean was itself a "survival" of an extension of the oceanic area properly so called,—retaining not only much of its salinity, but a portion of its characteristic fauna. And this conclusion derives confirmation from the fact (ascertained by the researches of the Russian naturalist, Bogdanoff) that the polar fauna may be traced through the succession of salt lakes lying to the north of the Aral Sea, and that its proportion increases as we approach the Polar Ocean. Now it is certain that the whole of this area was submerged during the Cretaceous period,—what is now the North Atlantic Ocean having then extended (with little interruption of its continuity) from the American continent to Siberia. The general rise of the Asiatic and European part of its sea-bed, which took place at the end of the Secondary period, may not improbably have cut off the Asiatic Mediterranean, enclosing it within the limits already pointed out, and at the same time elevating it above the general level of the sea. Under these conditions it would have for some time retained much of its original saltness; and this seems the explanation of the fact that the marine shells which are now scattered over the ancient sea-bed, and are occasionally found accumulated in masses, are much larger than the shells of the same species now inhabiting the weakly-saline Caspian. If the river-drainage into this area were more than sufficient to equalize its loss by evaporation, it may have remained without any essential alteration of its conditions, until the opening of the Bosphorus initiated a new succession of changes, which in the case of the Aral Sea appear to be still in progress. In this later succession, such alterations in the courses of the two great rivers of the Aralian area as are distinctly indicated by historical as well as physical evidence must have exerted a very important influence; and a due appreciation of the results of these alterations seems (as already shown) to afford the clue to the differences in the accounts that have been given of the Aral Sea within the historic period.

Bibliography.—In addition to the writings of Professor Von Baer and Major Wood, of which special mention has already been made, the student of the physical geography of the Aralo-Caspian area should refer to the discussion between Sir Roderick Murchison and Sir Henry Rawlinson

in the *Journal of the R. Geog. Soc.* for 1867; the paper of Professor Eichwald in the same journal; the *Aralseefrage* of Roesler (Vienna, 1873); and the learned *Das alte Bett des Ozens* of Professor Goeje (Leyden, 1875). (w. n. c.)

CASS, Lewis (1782-1866), an American general and statesman, was born at Exeter, New Hampshire, in the United States, on the 9th October 1782. He began life as a law-student, and was called to the bar at the age of twenty. Four years later he became a member of the Ohio Legislature. During the war with England (1812-1814) he served in the army, and rose to the rank of general. In 1813 he was appointed governor of Michigan,—a position which gave him the chief control of Indian affairs, for the territory was then occupied almost entirely by natives, there being only 6000 white settlers. This post he held for eighteen years, during which he obtained large tracts of territory from the Indians, instituted surveys, constructed roads, and explored the lakes and sources of the Mississippi. (For an account of these explorations see *North American Review*, l., lv.) About this time also he amassed the greater part of his large fortune by judicious purchase of land. In 1831 he became secretary of war under General Jackson, and he fulfilled the duties of this office during the first two years of the Florida war. Five years later he was appointed minister plenipotentiary to France, where he became acquainted with Louis Philippe, to whom he gives the highest praise in his *France: its King, Court, and Government* (1849). The cause of his resigning this appointment was that he disapproved of the concessions granted to England in the treaty concluded with Lord Ashburton by Daniel Webster, the American secretary of state, for the purpose of settling the dispute between England and the United States with regard to the north-eastern frontiers of the latter country. General Cass twice stood as candidate for the presidency, viz., in 1848 and 1852, but both times unsuccessfully. The last public office which he held was that of secretary of war under Buchanan; and, in the end of 1860, he retired into private life, upon the refusal of the president to send reinforcements to Fort Sumter. He died on the 17th June 1866. The chief points of the policy of General Cass were his defence of slavery, and his consequent attack upon the quintuple treaty which aimed at its suppression; his advocacy of a high protective tariff, and of extension of territory in the case of Texas; and his support of the cause of national unity, notwithstanding his expressed opinion that the Union had no right to coerce the separate States. As an author, General Cass is known by the writings already mentioned, and by his history of the Indians of the United States, which appeared in 1823. Accounts of his life have been published by H. R. Schoolcraft (1848), W. T. Young (1852), and W. L. G. Smith (1856).

CASSABA, or CASABA, a town of Asia Minor, in the sanjak of Manisa, 63 miles east of Smyrna, with which it is connected by rail. An abundant supply of water is conveyed to the town from a distance of two or three miles by an ancient aqueduct of very solid construction, which passes about 40 feet below the level of the soil, and is ventilated by air-shafts every 200 yards. Fountains are consequently numerous, and a stream of water flows down the middle of many of the streets; but the lack of underground sewers keeps the channels in a very filthy condition. There is a large bazaar, and a very flourishing trade is carried on in the produce of the surrounding district. Cotton is the most important article, and there are four ginning factories in the town; the silk-worm is largely raised and exported; and the "melons of Cassaba" are sent not only to Smyrna but to Constantinople. The influence of the connection with Smyrna is shown by the comparative neglect of several Eastern customs and the-

very general use of the Greek language. Though no identification has been attempted, the town probably occupies the site of some ancient city; it is only 21 miles distant from the ruins of Sardis. Its population is estimated at 15,000, of whom about 10,000 are Turks and the rest Greeks and Armenians. In 1865 a large number of houses were destroyed by fire, and the inhabitants were decimated by cholera.

CASSANA, NICCOLÒ (1659–1714), often called NICOLETTO an Italian painter, was born at Venice, and became a disciple of his father, Giovanni Francesco Cassana, a Genoese, who had been taught the art of painting by Bernardino Strozzi ("il Prete Genovese"). Having painted portraits of the Florentine court, and also of some of the English nobility, Nicoletto was invited to England, and introduced to Queen Anne, who sat to him for her likeness, and conferred on him many marks of favour. He died in London in 1714, having given way to drinking in his later years. Cassana was a man of the most vehement temper, and would wallow on the ground if provoked with his work. One of his principal paintings is the Conspiracy of Catiline, now in Florence.

CASSANDER (c. 354–297 B.C.), king of Macedonia, was probably born about 354 B.C. He first appears in history at the court of Alexander, defending his father Antipater against the accusations of his enemies. Whether it be true or not that he brought himself into disfavour by manifesting his contempt for the Eastern customs with which the king had surrounded himself, it is certain that he conceived a great hatred for Alexander, a hatred so well known that he was accused of having caused the king's death by poison. When his father became regent of Macedonia, Cassander was made chiliarch; but, when Polysperchon succeeded Antipater, he was not content with this position, but allied himself with Ptolemy Soter and Antigonus, and declared war against the regent. His success was such as to win over most of the Greek States; and he also effected an alliance with Eurydice, the ambitious wife of King Arrhidæus. Both she and her husband, however, together with Cassander's brother Nicanor, and a number of others, were soon after slain by Queen Olympias. Cassander at once marched against Olympias, and, having forced her to surrender in Pydna, put her to death. Not long afterwards he also murdered Roxana and Alexander, the wife and son of Alexander the Great. He had already connected himself with the royal family by marriage with Thessalonica, Alexander's half-sister, and, having formed an alliance with Seleucus, Ptolemy, and Lysimachus, and defeated Antigonus and Demetrius near Ipsus, in 301, Cassander became undisputed sovereign of Macedonia and nominal king of Greece. He died some three years after, in 297 B.C. For the history of his campaigns (which is given in Diodorus, xviii.–xxi.) see MACEDONIA. Cassander is said to have been a man of cultivated literary taste, and we are told that his delight in Homer was such that he could repeat from memory every line of his poems.

CASSANDER, GEORGE (1515–1566), a Flemish theologian, was born at Cadzand (whence his name), a village in Zeeland. He was for some time professor of classics and theology at Bruges and Ghent; but most of his life was spent in the endeavour to effect a reunion of the Roman Catholic and Protestant churches. In 1561 he published *De Officio Pii Viri in hoc Dissidio Religionis*, in which he argues that no one has a right, on account of a few abuses, utterly to subvert the church; but, on the other hand, he expresses his disagreement with those who regard the Pope as a deity. His standard is Scripture, explained by the tradition of the fathers, especial deference being paid to those who lived before Gregory I. Four years later, in 1565, he published his famous *Consultatio de Articularis*

Fidei inter Papistas et Protestantis controversis, in which he strives to put a Catholic interpretation into each of the articles of the Confession of Augsburg. Both these books were fiercely attacked by Calvin; and they were also both condemned by the Council of Trent. Cassander's complete works were published at Paris in 1616.

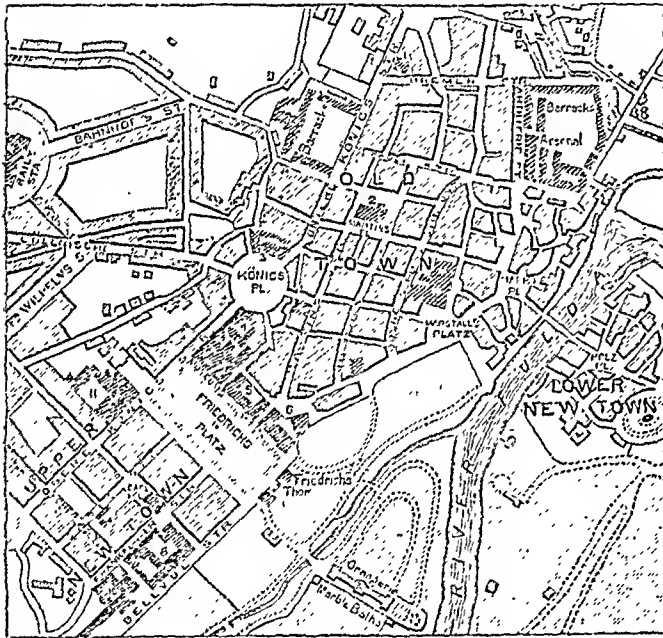

CASSANDRA, in Grecian story, daughter of Priam and Hecuba, was beloved of Apollo, who promised to bestow on her the spirit of prophecy if she would comply with his desires. Cassandra accepted the proposal; but no sooner had she obtained the gift than she laughed at the tempter, and refused to fulfil her promise. Apollo revenged himself by ordaining that her predictions should be discredited; and hence it was in vain that she prophesied the ruin of Troy. On the capture of that city she was ravished by Ajax, the son of Oileus, in the Temple of Minerva. In the distribution of the booty, Cassandra fell to the lot of Agamemnon, who loved her deeply; but again her foresight was useless, for he would not believe her prediction that he should perish in his own country. The prophecy was fulfilled, for both were slain through the intrigues of Clytemnestra.

CASSANO, a town and bishop's seat of Italy, in the province of Calabria Citra, seven miles E.S.E. of Castrovillari. It stands in a concave recess of a steep mountain, round an isolated rock, on which are the ruins of a grand feudal castle. It has hot sulphurous baths, of great local reputation, and is surrounded by beautiful scenery. Macaroni, stamped leather, table-linens, and cotton and silk stuffs are manufactured; and corn, fruits, and oil are raised in the vicinity. Cassano is usually identified with the *Castellum Carissanum* of Pliny, and *Cosa in Agro Thurino* of Caesar; and one of the towers of its castle is still known as *Torre di Milo* or Milo's Tower, in memory of the death of Cicero's famous client. Population, 9035.

CASSAVA is the name given to the farinaceous root stocks of two species of Euphorbiaceans plants, the Bitter Cassava, *Manihot utilisima*, and the Sweet Cassava, *M. Aipi*, both highly important sources of food starches. The plants are natives of South America, but the Bitter Cassava, which is the most important of the two in an economic sense, has been introduced into most tropical regions, and is extensively cultivated in the East Indian Archipelago, from which, as well as from Brazil and other South American states, its starch in the form of tapioca is a staple article of export. The Bitter Cassava root is fusiform, sometimes attaining a length of 3 feet and a weight of about 30 lb. Its sap contains hydrocyanic acid, and being therefore highly poisonous, the root cannot be eaten in a fresh condition; while on the other hand the Sweet Cassava is perfectly innocuous, and is employed as a table vegetable. Exposure to heat dissipates the poisonous principle, and the concentrated juice is in that state used as the basis of Cassareep and other sauces. From the Bitter Cassava roots many different food preparations are made in Brazil. The roots are preserved for use by being simply cleaned, sliced, and dried; from such dried slices manioc or cassava meal used for cassava cakes, &c., is prepared by rasping. The starch also is separated and used for food under the name of Brazilian arrowroot; and this, when agglomerated into pellets on hot plates, forms the tapioca of commerce. Cassava starch has a stellate hilum, which readily distinguishes it under the microscope from other starches. Its microscopic appearance is figured under ARROWROOT, vol. ii. p. 631, fig. 6.

CASSEL, or KASSEL, the capital of the former electorate of Hesse Cassel, in Western Germany, and, since its annexation by Prussia in 1866, the capital of the province of Hesse Nassau, is pleasantly situated on both sides of the River Fulda, over which a stone bridge leads to the lower

new town. The river is navigable, and railways connect the town with all parts of Germany. The streets of the old town are narrow and crooked, but those of the upper and lower new town, and the three suburbs, are not surpassed by any in Germany. The principal streets are the Königsstrasse (5100 feet long and 60 broad), the Bellevue-Strasse, and the Friedrich Wilhelm Strasse (180 feet broad with four rows of linden trees). The Friedrich's Platz is the largest square in Germany, being 1000 by 450 feet. It contains a marble statue of Landgrave Frederick II., and commands a fine view from the open side. The former residence of the electors fronts this square, as well as the Museum, considered the finest building in the town. This museum contains various valuable collections of curiosities, interesting mosaics, a library of 100,000 volumes and valuable manuscripts. In the cabinet of curiosities there is a complete collection of clocks and watches (including the so-called Egg of Nuremberg), from the earliest to the present time. Among other public places and buildings worthy of notice are the Roman Catholic church, with a splendid interior; the Military School; the Königs Platz, with a remarkable echo; the Karl's Platz, with the statue of Landgrave Charles; the Martin's Platz, with a large church containing the burial-vaults of the Hessian princes.

Plan of Cassel.

| 6. Military School. | |

The Gallery of Paintings in the Bellevue Castle has attracted of late many visitors to Cassel, as it contains numerous *chefs d'œuvre*, the most of which, before 1866, were not accessible to the public. Among these are fine specimens of Holbein, Cranach, Dürer, Rembrandt, Vandyck, Rubens, Mabuse, Teniers, Metz, Wouvermann, P. Potter, Ruysdael, Titian, Guido Reni, C. Dolce, the Caracci, Veronese, Murillo, and many other eminent painters. The town contains numerous educational institutions, including a polytechnic school, an academy of the fine arts, a lyceum, and a military academy. The descendants of the French refugees who founded the upper new town have a church of their own and a hospital, and the Jews, a very handsome synagogue. Music is much cultivated and there is a good opera with a first-rate

orchestra, of which Louis Spohr was at one time conductor. The opera house or theatre was built by Jerome Napoleon. Trade has very much increased of late, and among the manufactures are steam engines and locomotives, articles in silver and gold, philosophical instruments, tobacco, sugar, cotton and linen cloths, hats, leather, earriages, porcelain, soap, and chemicals. There are also several breweries; and two fairs are held annually. The celebrated chemists Bunsen and Kolbe are natives of Cassel. In the vicinity of the town are the Orangerie Château, and the Auegarten, a favourite promenade, with a marble bath.

On a slope of the Habichtswald Mountains, three miles from Cassel, and approached by an avenue, is the famous summer palace (with park and forest) of Wilhelmshöhe, sometimes called the Versailles of Germany. Napoleon III. resided here after the battle of Sedan. The surrounding gardens are beautifully adorned with fountains, cascades, lakes, and grottoes, the principal fountain sending up a jet of water 180 feet high and 12 feet in diameter. Here also is an interesting building called the Loewenburg, erected a century ago in the style of a fortified castle, and containing among other things portraits of the Tudors and Stuarts. The principal curiosity is the Karlsburg cascade, which is placed in a sort of broad ravine, thickly wooded on both sides. A staircase of 900 steps leads to the top. On one of the landings is a huge rudely-carved stone figure of the giant Enceladus, and at the top is an octagon building called the Riesenschloss, surmounted by a colossal copper figure of the Farnese Hercules, 31 feet high, whose club alone is sufficiently capacious to accommodate from eight to ten persons. In different parts of the park, and especially from the Octagon, charming views are obtained. The park was first formed by Landgrave Frederick II. (whose consort was Mary, daughter of George II. of England), and was finished by his successor, after whom it was named, and who is said to have employed 2000 workmen for fourteen years in its construction.

Perhaps the earliest mention of Cassel occurs in a document of the year 913, when the name appears in the form of Chassala. The town was fortified by the Landgrave Philip the Magnanimous in the 16th century; and in 1687 it was augmented by the formation of the Upper New Town by the Landgrave Charles. In 1762 it was captured by Frederick of Brunswick, after an obstinate siege, during which it had been defended by the French under Diesbach; and not long after its fortifications were dismantled. In 1807 it became the capital of the kingdom of Westphalia; in 1813 it was bombarded and captured by the Russian general Chemichoff; in 1830, 1831, and 1848 it was the scene of violent commotions; from 1850 to 1851 it was occupied by the Prussians, the Bavarians, and the Austrians; and in 1866 it passed definitively into the possession of Prussia. Of late it has become a very thriving town, and is now a very favourite residence for strangers. Population (1875), 50,000.

CASSEL, a town of France, in the department of Nord, and arrondissement of Hazebrouck, is situated 28 miles N.W. of Lille, on an isolated hill, 800 feet high, which commands a most extensive view in all directions. Portions of the three kingdoms of France, Belgium, and England can be seen, with 32 towns and 100 villages, including St Omer, Dunkirk, Ypres, and Ostend. The public buildings comprise a castle, a communal college, and a museum; and the ancient mansion known as La Noble Cour de Cassel is classed among the historic monuments of France. The manufactures of the town are lace, thread, stockings, pottery, leather, and oil; and it also trades in cattle. It is supposed to occupy the site of the *Castellum Morinorum*, and was certainly a Roman station, as the numerous

remains of the Gallo-Roman period sufficiently attest. It is frequently mentioned in the wars of the Middle Ages, and was the scene of important battles in 1071, 1328, and 1677. In 1771 General Vandamme was born in the town. Population in 1872, 3250.

CASSIA BARK is the aromatic bark derived from various species of *Cinnamomum* other than *C. zeylanicum*, which is the source of the true cinnamon of commerce. The greater part of the supply coming from China, it is sometimes termed Chinese cinnamon. The tree or trees which yield the Chinese supplies are very extensively cultivated throughout the southern provinces of that empire, and grow with little call for attention in situations unsuited for other forms of cultivation. From various species of *Cinnamomum*, cassia is also obtained in Northern India and Nepal, in Java, Borneo, Sumatra, and the Philippine Islands. The bark is imported into England in bundles, which are from 1 foot to 18 inches in length, and weigh about 1 lb. The bundles consist of quills of bark from half an inch to an inch in diameter, generally single, rarely double. The bark is much thicker than that of true cinnamon; the taste is more pungent and the flavour less delicate, though somewhat similar to that of cinnamon. A large quantity of thick, woody bark, of inferior quality, is now imported under the name *Cassia vera*, or Wild Cassia. The properties of cassia bark depend on the presence of a volatile oil—the oil of cassia, which is imported in a pretty pure state as an article of commerce from Canton. Cassia bark is in much more extensive demand on the Continent of Europe than in Great Britain, being preferred to cinnamon by Southern nations. Both oil and bark are useful in medicine; but their chief use is for flavouring liqueurs and chocolate, and in cooking generally. When ground as a spice it is difficult to distinguish cassia from cinnamon, and it is a common practice to substitute the cheap common spice for the more valuable article. The adulteration may be detected by the behaviour of a decoction in presence of iodine, which, in the case of cinnamon, produces little effect, but with cassia strikes a deep blue colour. *Cassia Buds*, which have a pleasing cinnamon flavour, are the immature fruits of the tree or trees which yield Chinese cassia. They are brought in considerable quantities from Canton, and used as a spice and in confectionery. Some confusion occasionally arises from the fact that *Cassia* is the generic name of an extensive genus of leguminous plants, which, in addition to various other medicinal products, is the source of the senna leaves which form a most important article of materia medica.

CASSIANUS, JOANNES EREMITA, or JOANNES MASSILIENSIS, a celebrated recluse, and one of the first founders of monastic institutions in Western Europe, was probably born about 360, and is supposed to have died about the year 448. The place of his nativity has been much disputed, but he spent the early part of his life in the monastery of Bethlehem, with his friend Gernianus. In company with that monk he visited Egypt, and dwelt for several years among the ascetics of the desert near the banks of the Nile. In 403 he repaired to Constantinople, where he received ordination as deacon from the hands of Chrysostom. At Marseilles he founded two religious societies—a convent for nuns, and the abbey of St Victor, which during his time is said to have contained 5000 inmates. In later times his regulations enjoyed a high reputation, and were adopted by the monks and nuns of Port Royal. He was eventually canonized; and a festival in his honour long continued to be celebrated at Marseilles on the 25th of July. Cassianus was one of the first and most prominent of the Semi-Pelagians, a sect who rejected the Augustinian positions that man, since the fall of Adam, is

by nature wholly worthless and incapable of even right desire, and that everything holy in him is the Divine gift, bestowed without reference to any merit, or even wish, on his part; but did not assert, with Pelagius, that man is born perfectly pure, and that the exercise of his free-will is sufficient to secure salvation. Cassianus maintained that while man is by nature sinful, he yet has some good remaining in him, and that, while the immediate gift of God's grace is necessary to salvation, conversion may also be commenced by the exercise of man's will. He further asserted that God is always willing to bestow his grace on all who seek it, though, at the same time, it is true that he sometimes bestows it without its being sought. These views have been held by a very large part of the church from his time, and embrace much of the essence of Arminianism. The style of Cassianus is careless and even slovenly, and displays no marks of literary polish, but its direct simplicity is far superior to the rhetorical conceits and affectations which disfigure most of the writings of that age. He has left *Collationes Patrum*, or conferences of the fathers of the desert; *De Institutione Cœnobiorum*, in twelve books, of which the first part gives an account of the Eastern monasteries, and the second contains discourses on the eight worst sins; and seven books upon the *Incarnation*, in confutation of the Nestorian heresy. The first edition of his collected works is that of Basel, 1559; the best are those of Frankfurt, 1722, and of Leipsic, 1733, which contain commentaries by Gazet.

See G. F. Wiggers, *De Joanne Cassiano Massiliensi*, Rostock, 1824, 1825; and Geffken, *Historia Semipelagianismi*, Göttingen, 1826.

CASSINI, the name of a family of distinguished astronomers, who succeeded one another as directors of the Observatory at Paris for four generations.

GIOVANNI DOMENICO CASSINI, the first and most famous, was born at Perinaldo, near Nice, on 8th June 1625, and died on 14th September 1712. He was educated by the Jesuits of Genoa, among whom he gained some reputation as a writer of Latin verse. His study of astronomy was introduced by a fancy for astrology; but, notwithstanding the success of several of his predictions, he became convinced of the baseless character of the art, and thenceforth gave himself entirely to the pursuit of the science, in which, at the age of twenty-five, he had made so much progress that he was appointed professor of astronomy in the University of Bologna. Here he made the observations on the comet of 1652 which formed the subject of his first book; in this he denied that comets are free from subjection to law, and explained them as the result of a mixture of exhalations from the earth and from the stars. About this time he gave a good deal of attention to experiments on the transfusion of blood, and on the habits and structure of insects. Five years later he had an opportunity of displaying his ability, as a man of business, on the occasion of a dispute between Bologna and Ferrara caused by the inundations of the Po; and his success was such that he was asked to continue to act as the representative of the Bolognese. He was also, soon after, appointed to take charge of the repairing of Fort Urban; and already he had gained the patronage of the Pope, Alexander VII. Clement IX., too, valued him so highly that it was only on condition that he should return to Italy after two or three years that he would consent to his accepting Colbert's offer of the directorship of the Observatory at Paris. Cassini, however, became attached to his new situation, was naturalized, and married a French lady. On 14th September 1671, he commenced his observations; and his discoveries soon made him the best known astronomer in Europe, and gained him a reputation of an extravagant character. See **ASTRONOMY**, vol. ii.

JACQUES CASSINI (1677–1756), was the son of Domenico

Cassini. After his father's death he became director of the Observatory at Paris, and was also appointed to the post of *maître des comptes*. His work, like his father's, was purely that of an observer, and he does not appear to have had any adequate knowledge of the state of philosophic thought in his own science. Though he had some personal acquaintance with Newton he does not seem to have understood his theories, and he was quite ignorant of the discoveries of nutation and the aberration of light. Nevertheless, largely on account of his father's fame, he enjoyed a high reputation throughout Europe.

CÉSAR FRANÇOIS CASSINI or CASSINI DE THURY (1714–1784), was son of the preceding, whom he succeeded in both his appointments. Like his father and grandfather he was a patient and accurate observer, but such work by itself no longer brought renown. He published *Elémens d'Astronomie* (1740); but his most important work was his topographical map of France, which was completed by his son.

JACQUES DOMINIQUE CASSINI, Count de Thury (1748–1845), son of the preceding, completed the line of Cassinis, who for a hundred and twenty-two years filled the post of director of the Observatory at Paris. He appears to have held more philosophical views than his predecessors; but his plans to improve the Observatory, by obtaining larger instruments, and by other means, were cut short in 1793. In that year the National Assembly decreed that three of his pupils should be united with him in his office, an arrangement to which he refused to submit. Next year he was in consequence imprisoned for seven months; and after this he abandoned astronomy, and spent the rest of his life in retirement. The chief events of his life as an astronomer were the voyage which he undertook to test the chronometers of Le Roy (1769), and his association with Mechain and Legendre in the work of connecting the observatories of Paris and Greenwich by means of a chain of triangles (1779).

CASSIODORUS, MAGNUS AURELIUS, a Roman historian, statesman, and monk, was born at Scylaceum (Squillace), about 468. According to his own statement, he began public life under Odoacer as head of financial affairs, with the title of *Comes sacrarum largitionum*. By Theodoric he was raised to the highest offices; and, while the Ostro-Gothic power lasted, notwithstanding the intrigues which surrounded the throne, he continued (with the exception of a short period of retirement at the tyrannous close of the reign of Theodoric), to regulate the affairs of the Western empire, and to support it by alliances with the Eastern. After the triumph of Belisarius, he retired, at seventy years of age, to the monastery of Viviers, which he had founded in his native province of Bruttium, where he spent about thirty years of far more importance to the world than the fifty during which he held the highest political authority. He deserves to be reckoned as one of the first and most influential of those who set the monks to literary work, and thus preserved the continuity of ancient and modern learning. He has also left a number of books, as the *De Artibus ac Disciplinis Liberalium Literarum*, the *De Institutione Divinarum Literarum*, and the *De Arte Grammatica*, which were much valued and used in the Middle Ages. But the work which is most valuable to us is his *Variarum Epistolarum Libri XII.*, which contains the decrees of Theodoric, and of his successors, Amalasontha, Athalaric, Theodatus, and Vitiges, and is the best source of our knowledge of the Ostro-Gothic empire in Italy. The writings of Cassiodorus evince great erudition, ingenuity, and labour, but are disfigured by incorrectness and an affected artificiality, and his Latin partakes much of the corruptions of the age. His complete works were published by Garet, with an account of his life, at Rouen,

1679, and Venice, 1729. See also Sainte Marthe's *Vie de Cassiodore* (Paris, 1694), and De Buat's account in the *Transactions of the Royal Academy of Munich*, vol. i.

CASSIS, a small seaport-town of France, in the department of Bouches-du-Rhône, stands in a narrow valley on the Mediterranean, 10 miles south-east of Marseilles. Its harbour is small, but it has some building yards, and a considerable trade in fruits and muscatel wine. The lighthouse is situated in 42° 12' 50" N. lat. and 5° 31' 54" E. long. The town is supposed by D'Anville to occupy the site of the Roman *Carsicis Portus*. It was destroyed by the Lombards in 573, but rebuilt in its present situation in the 13th century. The Abbé Barthélemy was born here in 1716. Population in 1872, 2976.

CASSIUS LONGINUS, CAIUS, is best known in history as one of the leaders in the assassination of Julius Caesar. Little is known of his early life. In 53 B.C. he served in the Parthian campaign under Crassus, and displayed great courage and skill. He succeeded in bringing off a division of the army after the defeat of Carrhæ, and in the following year, 52 B.C., the government of the province having fallen into his hands, he was able, by cautious and skilful dispositions, to drive back the Parthians. In 61 B.C. he was compelled to retreat before a large force of the Parthians under Osaces and Pacorus, but managed to throw himself into Antioch, a strongly-fortified town, which the invaders found impregnable. They were compelled to retreat, and Cassius, pursuing them rapidly, gained a complete victory. He returned to Rome soon after, with a large fortune, and in 49 B.C. became tribune of the plebs. He at first united his fortunes with those of Pompey, but after Pharsalia he surrendered to Caesar, and was treated by him with great generosity. He was made one of the legates, and in 44 B.C. became prætor peregrinus with the promise of the Syrian province for the ensuing year. He does not seem, however, to have been at all conciliated by these favours. He was one of the busiest of the conspirators against his benefactor, and took an active part in the assassination on the Ides of March. Brutus and Cassius soon afterwards left Italy, and gathered together their forces in Macedonia and Syria. They succeeded in overcoming the slight opposition that was offered them in the provinces, and after taking Rhodes, united at Sardis to make a stand against the second triumvirate. They took up their position at Philippi, where they were attacked by Antony and Octavianus. The division under Cassius was defeated, and Cassius himself, thinking all was lost, commanded his freedman to slay him. He was buried at Thasos.

CASSOWARY (*Casuarus*), a genus of Struthious Birds, only inferior in size to the ostrich, and, according to Professor Owen, approximating more closely than any other living birds to the extinct moas of New Zealand. Not many years ago only a single species of cassowary was known, but recent researches among the Australasian islands have led to the identification of at least other four species. They are all characterized by short rudimentary wings, consisting of four or five barbleless shafts, a few inches long, and apparently useless for purposes of flight, of running, or of defence; and by loosely webbed feathers, short on the neck, but of great length on the rump and back, whence they descend over the body forming a thick hair-like covering. They possess stout limbs, with which they kick in front, and have the inner toe armed with a long powerful claw. The Galeated Cassowary (*Casuarus galeatus*) stands 5 feet high, and has a horny, helmet-like protuberance on the crown of its head; the front of the neck is naked and provided with two brightly-coloured wattles; the tail is not apparent. It is a native of the Island of Ceram, where it is said to live in pairs, feeding

on fruits and herbs, and occasionally on small animals. The Mooruk, or Bennett's Cassowary (*Casuarus Bennettii*), is a shorter and more robust bird, approaching in the thickness of its legs to the moas. It differs further from the preceding species in having its head crowned with a horny plate instead of a helmet. It has hitherto only been found in New Britain, where the natives are said to regard it with some degree of veneration. When captured by them shortly after being hatched, and reared by the hand, it soon becomes tame and familiar; all the specimens which have reached Europe alive have been thus domesticated by the natives. The adult bird in the wild state is exceedingly shy and difficult of approach, and, owing to its great fleetness and strength, is rarely if ever caught. It eats voraciously, and, like the ostrich, will swallow whatever comes in its way. It has the curious habit, says Bennett (*Gatherings of a Naturalist in Australasia*), "of squatting down on its tarsi like a dog."

CASTAGNO, ANDREA DEL (1390–1457), a painter of the Florentine School, was born in 1390, probably at Castagno, in the district of Mugello, and died in August 1457. He imitated Masaccio and the naturalists of his time in boldness of attitude, but was deficient in grace and colouring. His name has for about four centuries been burdened with the heinous charge of murder; it was said that he treacherously assassinated his colleague, Domenico Veneziano, in order to monopolize the then recent secret of oil painting as practised in Flanders by the Van Eycks. This charge is now at last a proved untruth; Domenico died four years after Andrea. The latter is commonly called "Andrea (or Andreino) degl' Impiccati" (of the Hanged Men); this was in consequence of his being commissioned in 1435 to paint, in the Palazzo del Podestà in Florence, the fallen leaders of the Peruzzi and Albizzi—not (as currently said) the men of the Pazzi conspiracy, an event which did not occur until 1478, long after this painter's death. One of his principal works now extant (most of them have perished) is the equestrian figure of Nicola di Tolentino, in the cathedral of Florence.

CASTALIA, or FONS CASTALUS, a celebrated fountain in Greece, now called the Fountain of St John, which rises at the foot of Mount Parnassus, in the neighbourhood of Delphi. It was sacred to Apollo and the Muses, and its water was used in the religious purifications of the "Pythian Pilgrims." From its connection with the Muses it is frequently referred to both by classical and by modern poets as a source of inspiration. For further details see DELPHI.

CASTANOS, DON FRANCISCO XAVIER DE (c. 1756–1852), duke of Baylen, a Spanish general, who served in the Peninsular War, was born at Madrid. The exact year of his birth is not known, but it was probably about 1756. He was the son of a military officer; at the age of twelve he had received a commission as captain; and, while still very young, he was sent to study the art of war at the court of Frederick the Great. His first success was at Baylen, where, on the 22d of July 1808, 18,000 French under Dupont surrendered to him. It is, however, said that the chief credit in this engagement is due to the Swiss, Aloys Reding. In November of the same year, Castanos was defeated at Tudela; and during the rest of the war he occupied subordinate positions. He, however, distinguished himself at Vitoria, and was placed at the head of the army which was sent to assist the Allies in 1815; and till his death, which took place on the 24th September 1852, he held a high political position, being senator and guardian to Queen Isabella.

CASTE. There are not many forms of social organization on a large scale to which the name Caste has not been applied in a good or in a bad sense. Its Portuguese origin

simply suggests the idea of family; but before the word came to be extensively used in modern European languages, it had been for some time identified with the Brahmanic division of Hindu society into classes. The corresponding Hindu word is *varna*, or colour, and the words *gati*, *kula*, *gotra*, *pravara*, and *karana* are also used with different shades of meaning. Wherever, therefore, a writer has seen something which reminds him of any part of the extremely indeterminate notion, Indian caste, he has used the word, without regard to any particular age, race, locality, or set of social institutions. Thus Palgrave¹ maintains that the colleges of operatives, which inscriptions prove to have existed in Britain during the Roman period, were practically castes, because by the Theodosian code the son was compelled to follow the father's employment, and marriage into a family involved adoption of the family employment. But these *collegia opificum* seem to be just the forerunners of the voluntary associations for the regulation of industry and trade, the Frith-gilds, and Craft-gilds of later times, in which, no doubt, sons had great advantages as apprentices, but which admitted qualified strangers, and for which intermarriage was a matter of social feeling. The history of the formation of guilds shows, in fact, that they were really protests against the authoritative regulation of life from without and above. In the Saxon period, at any rate, there was nothing resembling caste in the strict sense. "The ceorl who had thriven so well as to have five hides of land rose to the rank of a thegn; his vergild became 1200 shillings; the value of his oath and the penalty of trespass against him increased in proportion; his descendants in the third generation became gesithcund. Nor was the character of the thriving defined; it might, so far as the terms of the custom went, be either purchase, or inheritance, or the receipt of royal bounty. The successful merchant might also thrive to thegn-right. The thegn himself might also rise to the rank, the estimation, and status of an earl."² It has been said that early German history is, as regards this matter, in contrast with English, and that true castes are to be found in the military associations (*Genossenschaften*) which arose from the older class of Dienstmannen, and in which every member—page, squire, or knight—must prove his knightly descent; the Bauernstand, or rural non-military population; the Bürgerstand, or merchant-class. The ministry of the Roman Catholic Church, was, however, never restricted by blood relation. There is no doubt that at some time or other professions were in most countries hereditary. Thus Prescott³ tells us that in Peru, notwithstanding the general rule that every man should make himself acquainted with the various arts, "there were certain individuals carefully trained to those occupations which minister to the wants of the more opulent classes. These occupations, like every other calling and office in Peru, always descended from father to son. The division of castes was in this particular as precise as that which existed in Hindustan or Egypt." Again, Zurita⁴ says that in Mexico no one could carry on trade except by right of inheritance, or by public permission. The Fiji carpenters form a separate caste, and in the Tonga Islands all the trades, except tattoo-markers, barbers, and club-carvers are hereditary,—the separate classes being named matabooles, mooas, and tooas. Nothing is more natural than that a father should teach his son his handicraft, especially if there be no organized system of public instruction; it gives the father help at a cheap rate, it is the easiest introduction to life for the son, and the custom.

or reputation of the father as a craftsman is often the most important legacy he has to leave. The value of transmitted skill in the simple crafts was very great; and what was once universal in communities, still survives in outlying portions of communities which have not been brought within the general market of exchange. But so long as this process remains natural, there can be no question of caste, which implies that the adoption of a new profession is not merely unusual, but wrong and punishable. Then, the word caste has been applied to sacred corporations. A family or a tribe is consecrated to the service of a particular altar, or all the altars of a particular god. Or a semi-sacred class, such as the Brehons or the Bards, is formed, and these, and perhaps some specially dignified professions, become hereditary, the others remaining free. Thus in Peru, the priests of the Sun at Cuzco transmitted their office to their sons; so did the Quipu-camayoc, or public registrars, and the *amantas* and *haravecs*, the learned men and singers. Benjamin Constant¹ has ventured on the ambitious generalization that in the South, as in Judea and Mexico, such corporations were hereditary, but that in the North and West they were in general elective.² In many countries political considerations, or distinctions of race, have prevented intermarriage between classes. Take, for example, the patricians and the plebeians at Rome, or the *Σπαρτιάται*, *Ἀδελφες*, or *περίοικοι*, and the *Εἰλωτες* at Sparta. In Guatemala it was the law that if any noble married a plebeian woman he should be degraded to the caste of *maztequal*, or plebeian, and be subject to the duties and services imposed on that class, and that the bulk of his estate should be sequestered to the king.³ In Malagasy marriage is strictly forbidden between the four classes of Nobles, Hovas, Zarahovas, and Andevos,—the lowest of whom, however, are apparently mere slaves. All nations have at one time opposed themselves to marriage with foreigners, known chiefly as enemies; and all nations have oppressed, industrially and politically, the races whom they have conquered. In one sense slavery might be called the lowest of castes, because in most of its actual forms it does permit some small customary rights to the slave. In another sense, the marriage of the queen's daughter with a commoner might be described as an infraction of caste rule.

Besides the forms of caste we have mentioned, there are many isolated communities which resemble one another in the fact that their members constantly intermarry, and which generally devote themselves to some one particular trade or industry. This "endogamy" seems to be characteristic of early social arrangements, and therefore the existing specimens of endogamous societies in Europe and Asia do not exhibit any high form of civilization. Among others may be mentioned the descendants of the "Bounty" mutineers, who still occupy Pitcairn Island;⁴

¹ *De la Religion*, ii. 83.

² Something like this is to be found in the Russian notion of *tehné*, or status according to official hierarchy of ranks, as modified by the custom of *myestnichestvo*, by which no one entering the public service could be placed beneath a person who had been subject to his father's orders. Hereditary nobility at one time belonged to every servant, military or civil, above a certain rank, and a family remaining out of office for two generations lost its rights of nobility; but in 1854 the privilege was confined to army colonels and state councillors of the 4th class. At one time, therefore, the *razriadnyia knight*, or special registers, superseded by Peter the Great's *barshkatnaya kniga*, or Velvet Book, contained a complete code of social privilege and precedence. Peter's "*tabel o rangakh*" contained fourteen classes. The subject is treated of in the 1600 articles of the ninth volume of the Russian Code *Svod Zakonov*. The Russian nobility, though deprived of their exemptions from conscription, personal taxation, and corporal punishment, still retain many advantages in the public service. ("L'Empire des Tsars," in *Revue des deux Mondes*, 1876.)

a community of Javans, near Surabaya, on the Tengger Hills, numbering about 1200 persons, distributed in about forty villages, and still following the ancient Hindu religion;⁵ the inhabitants of various fishing villages in Great Britain, such as Itchenferry near Southampton, Portland Island, Bentham in Yorkshire, Mousehole and Newlyn in Mountsbay, Cornwall, Boulmer near Alnwick (where almost all the inhabitants are called Stephenson, Stanton, or Stewart), Burnmouth, Ross, and (to some extent) Eyemouth in Berwickshire, Boyndie in Banffshire, Rathen in Aberdeenshire, Buckhaven in Fifeshire, Portmahomack and Balnabruach in Easter Ross. In France may be mentioned the commune of Bats, near Le Broisie in Loire-Inférieure; many of the central cantons of Brétagne; the singular society called Foréatines supposed to be of Irish descent, and living between St Armand and Pourges; the sailor population of Panillac (Gironde), Grauville, Arromanches, Portel (near Boulogne), and other fishing villages; the Republic of Audoire in the Pyrenees; the papermakers of Angoumois, Limousin, and Auvergne, whose trade seems to have doomed them to an hereditary weakness of constitution; the Marans of Auvergne, a race of Spanish converted Jews, accused of introducing syphilis into France; the Hautponnais and Lyzelards of St Omer, who have also a separate Flemish dialect; the Burins and Sermoyers, chiefly cattle-breeders, scattered over the department of Ain and the arrondissement of Bourg en Bresse. The Vaqueros, shepherds in the Asturias Mountains; the Jewish Chuetas of Majorca; the Petits-Créoles or Petits-Blancs, descendants of the original French settlers in Réunion, are also good examples of what biologists call "in-and-in breeding," as opposed to "crossing." On a larger scale the Icelanders, the ancient Samaritans (now almost extinguished, see *Times*, 4th April 1874), and the great and prosperous Jewish nation, may be called castes, so far as intermarriage is concerned. It must not be imagined, however, that this is a general characteristic of a certain stage of social development. "Exogamy," or the rule requiring either absolutely or in certain circumstances marriage with a stranger, is recognized very widely even by modern tribes, especially in Asia; and both these conditions of things seem to have been preceded by a primitive state, in which the relations of the sexes were promiscuous.⁶ This is illustrated in the case of the Thlinkets, or Kolosches, who inhabit the coasts and islands from Mt. St Elias to the River Nass. This singular tribe, which has an elective chief and systematic slavery (chiefly supplied from the Flatheads of Oregon), is divided into two castes, the Wolf and the Raven, the symbols of which appear on their houses, boats, robes, and shields. The Wolf caste is subdivided into the bear, eagle, dolphin, shark, and alca; the Raven, into frog, goose, sea lion, owl, and salmon. "The young Wolf warrior must seek his mate among the Ravens; and while celebrating his nuptials one day, he may on the next be called to fight his father-in-law over some hereditary feud." Similarly, the Kutchin tribe of the Tinnah family, inhabiting the Yukon, Tananah, and Peel river-valleys, have a singular system of *totems*. There are three castes; and persons of the same caste are not allowed to marry each other. The mother gives caste to the children, so that as the fathers die off the caste constantly changes. It also happens that when a child is named, the father adopts that name and drops his own. The system prevents civil war.⁷

Caste in India is a question of more than historical interest. It is the great difficulty in the way of Government in framing laws and in governing the army, of native

religious reformers in attacking the Brahmanic superstitions, and of the Protestant missionaries, who are unable to offer in the British society of India a sympathizing and protecting caste in place of that which it costs the convert so much to leave. Probably owing to the extent of our Indian Empire, and the great varieties of caste custom which prevail, one hears very conflicting accounts and opinions of the institution. Writers such as Robertson and Dubois have regarded it as the great safeguard of social tranquillity, and therefore as the indispensable condition of the progress in certain arts and industries which the Hindus have undoubtedly made. Others, such as James Mill, denounce it as now at least a great political blunder, fatal to free competition, and opposed to individual happiness. The latter view assumes a state of facts which is denied by Mr Colebrooke, one of the highest authorities on Indian matters. Writing in 1798 he says,¹ after pointing out that any person unable to earn a subsistence by the exercise of his profession may follow the trade of a lower caste or even of a higher; "Daily observation shows even Brahmans exercising the menial profession of a Sudra. We are aware that every caste forms itself into clubs or lodges, consisting of the several individuals of that caste residing within a small distance, and that these clubs or lodges govern themselves by particular rules or customs or by-laws. But though some restrictions and limitations, not founded on religious prejudices, are found among their by-laws, it may be received as a general maxim that the occupation appointed for each tribe is entitled merely to a preference. Every profession, with few exceptions, is open to every description of persons; and the discouragement arising from religious prejudices is not greater than what exists in Great Britain from the effects of municipal and corporation laws. In Bengal the numbers of people actually willing to apply to any particular occupation are sufficient for the unlimited extension of any manufacture." This is corroborated by Elphinstone,² who states that, during a long experience of India, he never heard of a single case of degradation from caste; and it is illustrated by the experience of the British army, in which men of all castes unite.

The popular notion of modern caste is that it involves certain restrictions on marriage, on profession, and on social intercourse, especially that implied in eating and drinking together. But how far intermarriage is permitted, what are the effects of a marriage permitted but looked on as irregular, what are the penalties of a marriage forbidden, whether the rules protecting trades and occupations are in effect more than a kind of unionism grown inveterate through custom, by what means caste is lost, and in what circumstances it may be regained,—these are questions on which very little real or definite knowledge exists. It is very remarkable that the Vedas, on which the whole structure of Brahmanic faith and morals professes to rest, give no countenance to the later regulations of caste. The only passage bearing on the subject is in the Purnsha Sukta, the 90th Hymn of the 10th Book of the Rigveda Samhita. "When they divided man, how many did they make him? What was his mouth? what his arms? what are called his thighs and feet? The Brahmana was his mouth, the Raganya was made his arms, the Vaisya became his thighs, the Sudra was born from his feet." Haug finds in this a subtle allegory that the Brahmans were teachers, the Kshatriyas the warriors of mankind. But this is opposed to the simple and direct language of the Vedic hymns, and to the fact that in the accounts of creation there the origin of many things besides classes of men is attributed in the

same fanciful manner to parts of the divine person. It is in the Puranas and the Laws of Manu, neither of which claims direct inspiration, where they differ from the letter of the Veda, that the texts are to be found on which all that is objectionable in caste has been based. Even in the Vishnu Purana, however, the legend of caste speaks of the four classes as being at first "perfectly inclined to conduct springing from religious faith." It is not till after the whole human race has fallen into sin that separate social duties are assigned to the classes. The same hymn speaks of the evolution of qualities of Brahma. Sattva, or goodness, sprang from the mouth of Brahma; Rajas, or passion, came from his breast; Tamas, or darkness, from his thighs; others he created from his feet. For each one of these gunas, or primitive differences of quality, a thousand couples, male and female, have been created, to which the distinct heavens, or places of perfection of Prajapati, Indra, Maruts, and Gandharvas are assigned. To the gunas are related the yugas, or ages: 1st, the Krita, or glorious age of truth and piety, in which apparently no distinctions, at least no grades of excellence were known; 2d, the Treta, or period of knowledge; 3d, the Dvapara, or period of sacrifice; 4th, the Kali, or period of darkness. Bunsen supposes there may be an historical element in the legend that Pururava, a great conqueror of the Treta age founded caste. The yugas are hardly periods of historical chronology, but there is no doubt that the Vayu Purana assigns the definite origin of caste to the Treta period. "The perfect beings of the first age, some tranquil, some fiery, some active, and some distressed, were again born in the Treta, as Brahmans, &c., governed by the good and bad actions performed in former births." The same hymn proceeds to explain that the first arrangement did not work well, and that a second was made, by which force, criminal justice, and war were declared to be the business of the Kshatriyas; officiating at sacrifices, sacred study, and the receipt of presents to belong to the Brahmans; traffic, cattle, and agriculture to the Vaisyas; the mechanical arts and service to the Sudras. The Ramayana hymn suggests that in the four great periods the castes successively arrive at the state of *dharma* or righteousness. Thus, a Sudra cannot, even by the most rigorous self-mortification, become righteous in the period proper to the salvation of the Vaisyas. As the hymn speaks in the Dvapara age, it speaks of the salvation of Sudras as future, and not yet possible. Wholly in opposition to the story of a fourfold birth from Brahma is the legend that the castes sprang from Manu himself, who is removed by several generations of gods and demi-gods from Brahma. Then, again, the Santiparvan alleges that the world, at first entirely Brahmanic, was separated into castes merely by the evil works of man. Castehood consists in the exercise of certain virtues or vices. *Munis*, or persons born indiscriminately, frequently rise to the caste of Brahmans, and the offspring of Brahmans sinks to a lower level. The serpent observes: "If a man is regarded by you as being a Brahman only in consequence of his conduct, then birth is vain, until action is shown." But this change of caste takes place only through a second birth, and not during the life which is spent in virtue. Another poetical conception of caste birth is expressed in the Harivansa: The Brahmans were formed from an imperishable element (Akshara), the Kshatriyas from a perishable element (Kshara), the Vaisyas from alteration, and the Sudras from a modification of smoke. The general result of the foregoing texts is that there are several contradictory accounts of the origin of caste, and that these are for the most part unintelligible. Caste is described as a late episode in creation, and as born from different parts of different gods, from the mortal Manu, from abstract

¹ *Life and Essays of H. T. Colebrooke*, i. p. 104.

² *History of India*.

principles, and from non-entirety. It is also described as coeval with creation, as existing in perfection during the Krita period, and subsequently falling into sin. It is also said that only Brahmans existed at first, the others only at later periods. Then the rationalistic theories of the Santiparvan upset the very foundation of caste; viz., hereditary transmission of the caste character.¹ It seems clear that when the Vedas were composed, many persons who were not Brahmans acted as priests, and saints, the "preceptors of gods," by their "austere fervour," rose from a lower rank to the dignity of Brahmanhood. Originally, indeed, access to the gods by prayer and sacrifice was open to all classes of the community. As the Brahmans grow in political importance, they make religion an exclusive and sacred business. We find them deciding questions of succession to the throne, and enforcing their decisions. While in the earlier literature there are several instances of Brahmans receiving instruction from the hands of Kshatriyas, in the Puranas and Manu death is made to overtake Kshatriyas who are not submissive to the Brahmans; and in one case Visvamitra, the son of Gadhi, actually obtains Brahmanhood as a reward for his submission. It seems certain that many of the ancient myths were expressly manufactured by the Brahmans to show their superiority in birth and in the favour of Heaven to the Kshatriyas,—a poetical effect which is sometimes spoiled by their claiming descent from their rivals. This brings us to a consideration of the theories which have been started to account for the appearance of Brahmanic caste, as it is stereotyped in the Laws of Manu. James Mill, who invariably underestimated the influence on history of "previous states of society," has suggested that the original division must have been the work of some inspired individual, a legislator or a social reformer, who perceived the advantages which would result from a systematic division of labour. The subordination of castes he accounts for by the superstitious terror and the designing lust of power which have so frequently been invoked to explain the natural supremacy of the religious class. Because the ravages of war were dreaded most after the calamities sent by heaven, he finds that the military class properly occupy the second place. This arrangement he apparently contemplates as at no time either necessary or wholesome, and as finally destroyed by the selfish jealousies of caste, and by the degradations which the multiplication of trades made inevitable. Heeren² and Klaproth have contended that the division into castes is founded on an original diversity of race, and that the higher castes are possessed of superior beauty. The clear complexion and regular features of the Brahmans are said to distinguish them as completely from the Sudras as the Spanish Creoles were distinguished from the Peruvians. "The high forehead, the stout build, and the light copper colour of the Brahmans and other castes allied to them, appear in strong contrast with the somewhat low and wide heads, slight make, and dark bronze of the low castes" (Stevenson, quoted by Müller, *Chips*, ii. p. 327).³ This explanation is, however, generally conjoined with that founded on the tradition of conquest by the higher castes. There is no doubt that the three castes of lighter colour (traivarnika), the white

Brahmans, the red Kshatriyas, the yellow Vaisyas, are, at least in the early hymns and Brahmanas, spoken of as the Aryas, the Sanskrit-speaking conquerors, in contradistinction to the dark cloud of the Turanian aborigines Dasyus. In fact *ārya*, which means noble, is derived from *ārya*, which means householder, and was the original name of the largest caste, now called Vaisyas. Roth, in his "Brahma and the Brahmans,"⁴ holds that the Vedic people advanced from their home in the Punjab, drove the aborigines into the hills, and took possession of the country lying between the Ganges, the Jumna, and the Vindhya range. "In this stage of complication and disturbance," he says, "power naturally fell into the hands of those who did not possess any direct authority," i.e., the domestic priests of the numerous tribal kings. The Sudras he regards as a conquered race, perhaps a branch of the Aryan stock, which immigrated at an earlier period into India, perhaps an autochthonous Indian tribe. The latter hypothesis is opposed to the fact that, while the Sudra is debarred from sharing three important Vedic sacrifices, the Bhagazata Purana expressly permits him to sacrifice "without mantras," and imposes on him duties with reference to Brahmans and cows which one would not expect in the case of a nation strange in blood. But unless a previous subordination of castes among the conquering race be supposed, it seems difficult to see why the warrior-class, who having contributed most to the conquest must have been masters of the situation, should have consented to degradation below the class of Brahmans. The position of the Sudra certainly suggests conquest. But are there sound historical reasons for supposing that Brahmans and Sudras belonged to different nations, or that either class was confined to one nation? The hypothesis is slightly modified by Meiners,⁵ who supposes that instead of one conquest there may have been two successive immigrations,—the first immigrants being subdued by the second, and then forming an intermediate class between their conquerors and the aborigines; or, if there were no aborigines, the mixture of the two immigrant races would form an intermediate class. In the same way Mr Talboys Wheeler⁶ suggests that the Sudra may be the original conquerors of the race now represented by the Pariahs. Most of these explanations seem rather to describe the mode in which the existing institutions of caste might be transplanted from one land to another, from a motherland to its colonies, and altered by its new conditions. Military conquest, though it often introduces servitude, does not naturally lead to the elevation of the priesthood. It is unscientific to assume large historical events, or large ethnological facts, or the existence of some creator of social order.⁷

As Benjamin Constant⁸ points out, caste rests on the religious idea of an indelible stain resting on certain men, and the social idea of certain functions being committed to certain classes. The idea of physical purity was largely developed under the Mosaic legislation; in fact the internal regulations of the Essenes (who were divided into four classes) resemble the frivolous prohibitions of Brahmanism. As the daily intercourse of men in trade and industry

⁶ *History of India*, vol. i.

⁷ For a characteristic appreciation of caste see Comte, *Cours de Philosophie Positive*, vi. c. 8. He regards the hereditary transmission of functions under the rule of a sacerdotal class as a necessary and universal stage of social progress, greatly modified by war and colonization. The morality of caste was, he contends, an improvement on what preceded; but its permanence was impossible, because "the political rule of intelligence is hostile to human progress." The seclusion of women and the preservation of industrial inventions were features of caste; and the higher priests were also magistrates, philosophers, artists, engineers, and physicians.

³ The idea of a conquering white race is strangely repeated in the later history of India. The Rajputs and Brahmans are succeeded by the Mussulmans, the Turks, the Afghans. There was an aristocracy of colour under the Moghul dynasty. But under an Indian climate it could not last many generations. The Brahmans of Southern India were as black as the lowest castes; the Chandalas are said to be descended from Brahmans. According to Manu the Chandala must not dwell within town; his sole wealth must be dogs and asses; his clothes must consist of the mantles of deceased persons; his dishes must be broken pots. Surely this vituperative description must apply to an aboriginal race.

decretals, imperial constitutions, &c., which was produced in Gaul about the beginning of the 6th century, and is known to us as Quesnel's *Codex Canonum* from the name of its first editor (Paris, 1675). The different ecclesiastical provinces possessed in addition the canons of their own particular synods, and Papal decretals addressed to the bishops within their bounds; and many Frankish prelates were in the habit of drawing up for their subordinate clergy short compendiums of canon law, in which they inserted any particular regulations the local circumstances demanded. These so-called *Capitula Episcoporum* are printed in vols. xiii.-xv. of Mansi's *Sacrorum Conciliorum Collectio*.

The *Hispana* got into circulation among the Franks in a more or less corrupt form. One edition, which appeared about the middle of the 9th century, has become celebrated in church history as the *Collectio Pseudo-Isidoriana* or *False Decretals*. Everything connected with this collection its date, its author, its subject-matter, its purpose, has formed the subject of controversy, giving rise to a considerable literature. We must here confine ourselves to the results of the latest criticism.

The following particulars seem to be settled. The work, which is divided into three parts, was compiled by a single author, a Frankish ecclesiastic, between the years 840 and 860. From his styling himself in the preface *Isidorus Mercator*, Bishop Isidore of Seville was mistakenly supposed to be the author, and hence the name *Pseudo-Isidore*. After the preface, and some minor apocryphal documents, the first part contains fifty of the Apostolic Canons extracted from the *Hispana*, and sixty spurious decretals of the popes from Clement I (101) to Melehiades (314), chronologically arranged. The second part consists chiefly of canons taken from the *Hispana*. The author has also used the latter as the substratum of the third part, but has interpolated thirty-five fictitious decretals. A supplement is appended to some of the manuscripts containing, with a few unimportant pieces, a series of brief regulations regarding processes against bishops. These are the so-called *Capitula Angilramni* (a bishop of Metz), which are now thought to be older than the main collection.

No suspicion attached to the *Pseudo-Isidore* at the time of its appearance. On the contrary, it was everywhere accepted without question till Cardinal Nicolas of Cusa, in the 15th century, expressed doubts of the genuineness of some of its contents. During the next hundred years the untrustworthy nature of the book (printed by Merlin in his *Concilia Generalia*, Paris, 1523) was irrefragably demonstrated by the labours of Erasmus, the Magdeburg Centuriators, and especially the Calvinistic pastor, David Blondel. It was subjected to the fierce attacks of the Protestant Reformers, who approached the question less in a scientific spirit than with a desire to reveal the iniquities of the Church of Rome. They maintained with much acrimony that the work was a deliberate forgery, undertaken by command, or at least with the connivance, of the Pope, to exalt his temporal and spiritual power. In modern times the controversy has been carried on chiefly by lawyers, and, the theological dust having subsided, it has become easier to define the limits within which lie the only probable views as to the sources and object of the work. It is to be regretted that some symptoms have recently appeared of a revival of the former bitter feeling in connection with the Old Catholic movement in Germany. (*The Pope and the Council*, by Jaus, 3d. ed., London, 1870).

The idea is exploded that the *False Decretals* were the invention of their author's brain, fabricated for purposes of Papal aggrandizement. Many of the apocryphal portions (the Apostolic Canons, &c.) had been for centuries in

circulation as genuine. Of the decretals a considerable number are authentic, though antedated and ascribed to early popes to give them the authority of antiquity, while others embody the traditional contents of actual but lost decretals. The sources from which the compiler principally borrowed his materials were the Bible, the fathers, genuine canons and decretals, Roman law from the West Gothic Breviary of Alarie, the works of Rufinus and Cassiodorus on ecclesiastical history, and the biographies of popes in the *Liber Pontificalis*. It is now admitted by Protestant writers that the compilation was produced in the interest not of the Pope but of the bishops, in order, by protecting them from the oppression of temporal princes on the one hand and ecclesiastical councils on the other, to correct some abuses prevailing among the Franks. The tendency of the authorities collected was to support a right of appeal to the Pope in every *causa major*, i.e., process where a bishop was concerned, and to make the permission of the Pope a necessary preliminary to the assembling of a provincial council. This arrangement did not really secure the independence of the episcopate. It merely shifted the supreme control from a body of men to a single individual, in accordance with the constitutional ideas of the Middle Ages.

It is still a matter of controversy how far the course of ecclesiastical history has been influenced by the *False Decretals*. On the one hand it is maintained, chiefly by Roman Catholic writers, that they effected no essential alteration on the previous constitution or discipline of the church, that they merely gave the form of enactment to the prevailing ideas of the time on church government, and that the latter would have developed in the same direction had no such compilation ever appeared. It is argued reasonably enough that if any great innovation had been introduced the genuineness of the work would not have remained so long unchallenged. Some Protestant writers on the other hand assert that the Papal claim to absolute supremacy, over councils and hierarchy within the church and the laity without, was a pretension unknown till the 9th century, and entirely based upon the *False Decretals*. The truth probably lies between the two views. The influence of the *Pseudo-Isidore* has been greatly overrated. But it cannot be denied that the embodiment in a definite shape of the indistinct but yet perceptible tendency of church development in the 9th century was of considerable service to the popes during the struggle of the Hildebrandine era. (The latest and best edition of the *False Decretals* is *Decretales Pseudo-Isidorianæ et Capitula Angilramni*, by Hinsehius, Leipzig, 1863.)

Other sources of church law prior to the *Decretum* of Gratian may be mentioned. Many laws on the rights and duties of the clergy were contained in the different compilations of Roman law (Theodosian and Justinian codes, Julian's Epitome of the Novels, and the Breviary of Alarie) and the *Leges Barbarorum* (especially the *Lex Ripuaria Bajuvariorum* and *Alamannorum*). Of a similar character were some of the capitularies of the Frankish kings, a collection of which in four books was made by the Abbot Ansegisus of Fontanella in 827, and officially promulgated. A more important collection from an ecclesiastical point of view was that of Benedict, a deacon of Mainz (Benedictus Levita), who, by order of Bishop Otgar of Mainz compiled a supplement to Ansegisus in three books about the year 850. In addition to capitularies the work comprises extracts from the above-named Roman and German sources, from the Bible, penitential-books, the fathers, and other ecclesiastical writers, as well as canons copied apparently from the *Hispana* and *Dionysio-Hadriana*. It resembles the *Pseudo-Isidore* in containing much apocryphal matter in the form of false capitularies directed to

the removal of certain grievances of the Frankish episcopate. Being circulated as a supplement to Ansegisus it gained a considerable reputation, but was never officially recognized.¹ The *libri pœnitentiales*, or manuals of penance, are of importance as the foundation of the criminal branch of the canon law. The earliest ones of any note in the Western Church originated in England and Ireland, as for instance the *Liber Davidis* (Irish) of the 4th century, the penitential of Theodore, archbishop of Canterbury, in the 7th century, and in the 8th those of the Venerable Bede and of Egbert, archbishop of York. The Irish church-discipline was introduced among the Franks, by whom the *Pœnitentiale Columbani* and the *Canones* and *Judicia Cummeani* (two Irish missionaries) were extensively used.² (Consult Jacobson in Herzog's *Real-Encyclopædie*, art. "Bussbücher.") The development of church-law was further influenced by the *Ordines Romani*, or books of ritual, the *Ordines Judiciorum*, or rules of procedure in the ecclesiastical courts, and the collections of *formulae* or precedents used in the preparation of formal or official documents, notably the *Liber Diurnus*, a pontifical collection of the 8th century.

The *Pseudo-Isidore* continued to be the chief repertory of canon law till the time of Gratian; but many other collections more or less corrupt, differing from the earlier ones in their arrangement according to systematic instead of chronological order, were made during these three centuries. It will be sufficient to name the following, as they seem to have been used by Gratian in compiling his great work:—1. A collection of the 9th century, dedicated to Archbishop Anselm (II.) of Milan (*Collectio Anselmo Dedicata*), based mostly on the *Hispana*, and interesting as the first work of authority containing extracts from the *Pseudo-Isidore*; 2. The *Libri Duo de Synodaliibus Causis et Disciplinis Ecclesiasticis* of the 10th century, by Regino, abbot of the monastery of Prüm in the Eiffel, drawn from Frankish and German sources;³ 3. The *Collectarium* or *Decretum* of Bishop Burchard of Worms, in twenty books, compiled in the 11th century; 4. The *Pannormia* of Bishop Ivo of Chartres, dating from the 12th century,⁴ and another work by the same author known as the *Decretum*;⁵ 5. The *Liber de Misericordia et Justitia* of Algerus of Liège, composed between 1120 and 1128.⁶

II. The *CORPUS JURIS CANONICI*.—The manuals of church law above referred to had not only become embarrassing by their number but laboured under defects that seriously impaired their practical utility. They contained much that was obsolete and much that was contradictory, many of them mixed up civil with church law, and their arrangement was unmethodical and cumbrous. These faults were to some extent remedied in the great collection that was formed between the middle of the 12th and the end of the 16th centuries, and became the recognized canon law code. The *Corpus Juris Canonici*, as it was called, consists of six portions, which may be classed under two heads, the *Decretum* and the *Decretals*.

1. The *Decretum Gratiani*. Up to this time canon law

was regarded as a branch of theology, and was studied only in the seminaries attached to cathedrals or monasteries. Gratian, a Camaldolensian monk of Bologna, first taught it as a separate science towards the middle of the 12th century. The school of Roman law founded in that city thirty or forty years before by Irnerius was then flourishing, and Gratian, living within the sphere of the new movement, became ambitious of introducing a similar scientific cultivation of canon law. He selected the whole subsisting law of the church from among the mass of canons, decretals, writings of the fathers, and ecclesiastical historians, &c., and digested it into the systematic work since called after him the *Decretum Gratiani*, which soon superseded all preceding compilations. It was early known by the name of the *Concordia Discordantium Canonum*, from an expression in one of the author's notes ("*auctoritatum dissonantia ad concordiam revocari*"); but whether Gratian himself made use of either name is uncertain. The work consists of three parts (*partes*). The first, treating of the sources of canon law and of ecclesiastical persons and offices, is divided according to the method of Paucapalea, Gratian's pupil, into 101 *distinctiones*, which are subdivided into *canones*. The second part consists of 36 *causæ* (cases proposed for solution), subdivided into *questiones* (the several questions raised by the case), under each of which are arranged the various *canones* (canons, decretals, &c.) bearing on the question. But *causa xxxiii. questio 3*, headed *Tractatus de Pœnitentia*, is divided like the main part into seven *distinctiones*, containing each several *canones*. The third part, which is entitled *De Consecratione*, gives, in five *distinctiones*, the law bearing on church ritual and the sacraments. The following is the method of citation. A reference to the first part indicates the initial words or number of the canon and the number of the *distinctio*, e.g., can. Propter ecclesiasticas, dist. xviii. or c. 15, d. xviii. The second part is cited by the canon, causa, and questio, e.g., can. Si quis suadente, C. 17, qu. 4, or c. 29, C. xvii, qu. 4. The treatise *De Pœnitentia*, forming the 3d questio of the 33d causa of the second part, is referred to as if it were a separate work, e.g., c. Principium, D. ii. de pœnit. or c. 45, D. ii. de pœnit. In quoting a passage from the third part the canon and distinctio are given, e.g., c. Missar. solenn. D. I. de consecrat., or c. 12, D. I. de consecr.

The original notes appended by Gratian to many of the canons (*Dicta Gratiani*), though not entitled to the Dicta same weight as the text, are of great authority as emanating from the "father of canon law." The passages headed "Palea" (about fifty in number) are supposed to be Palea. additions made by Gratian's pupil Paucapalea, and are of equal credit with the rest of the work. The notes in the modern editions with the prefix "corr. Rom." are by the *Correctores Romani*, who published a revised text under the sanction of Pope Gregory XIII.

Gratian had included in the *Decretum* the Papal decretals down to the year 1139. During the following century, owing to the struggles of the popes and emperors, and the general extension of ecclesiastical jurisdictions, the pontifical constitutions increased greatly in frequency. Innocent III. alone (*pater juris*) is said to have published 4000 laws. These constitutions went by the name of *decretales extravagantes* (i.e., *extra decretum Gratiani vagantes*). Of the fifteen known collections of them, five especially, which in contrast to that of Gregory IX. are called the *Compilationes Antiquæ*, attained a high reputation in the schools and the courts. The *Compilatio Prima*, or oldest of them, is the *Breviarium Extravagantium* of Bishop Bernard of Pavia,⁷ which is noteworthy as the model of arrangement for all subsequent collections. It is divided into five books treating of—(1)

⁸ Printed in Labbé, *Antiquæ Collectiones Decretalium*, Paris, 1609.

ecclesiastical officials and judges; (2) procedure in ecclesiastical courts; (3) rights, duties, and property of the clergy; (4) law of marriage; (5) criminal law and ecclesiastical discipline. This order is briefly summed up in the following hexameter:—

Judex, Judicium, Clerus, Connubia, Crimen.

The *comp. tertia* and *comp. quinta* are the only two that received the Papal sanction.

2. The second part of the *Corpus Juris Canonici* is made up of the following four collections of decretals:—

(a.) *Decretals of Gregory IX.*—The same causes that occasioned the compilation of the *Decretum* induced Pope Gregory IX. to commission his chaplain, Raymond of Pennafort (near Barcelona), formerly a professor of canon law in Bologna university (and since canonized), to digest into a code the decretals since the time of Gratian. The usual arrangement in five books was observed, and these were subdivided into *tituli*, consisting of *capita* in chronological order. It was completed in four years, and officially promulgated in 1234. Its original name was *Libri extra* (sc. *Decretum*) which was abbreviated to X. for convenience in citation, e.g., cap. 9, X. de eo qui cognovit (iv. 13), or c. 9, X. 4, 13 refers to the 4th book, title 13, chap. 9. The laws are in the form of decisions pronounced in cases submitted to the Pope from all parts of Christendom. Among these are several cases from England and Scotland. (For a list of the latter see *Ecclesiæ Scotiæ Statuta*, ii. 232). Raymond, in accordance with the Pope's instructions, omitted such facts and other matter as he considered irrelevant to the case in hand. These so-called *partes decisæ* (generally indicated in the text by the words "et infra" or shortly "et j.") have been restored in modern editions, since without them the law is often to us unintelligible.

(b.) The *Liber Sextus* was published by Pope Boniface VIII. in 1298. It contains the decretals down to that date from the time of Gregory's collection, and acquired its name from being intended as a supplement to Gregory's five books. In one important respect it differs from the latter. Instead of a case being stated with the Papal decision thereon, abstract rules of law are laid down, extracted originally, no doubt, from actual judgments. A series of eighty-eight *Regulæ Juris*, chiefly borrowed from Roman law, are appended to the work, having been added, it is said, by the civilian Dinus to procure its acceptance among the *legiste* of Bologna. In citing from the *Liber Sextus* it is usual to give the number of the chapter, with the abbreviation "in vi^{to}" or "in 6," the number of the book, and the number and rubric of the title, e.g., c. 1. in vi^{to} de const. L, 2, or c. 1. de const. in 6, l. 2.

(c.) The *Clementinæ*.—By direction of Pope Clement V. the canons of the Council of Vienne in 1311 (at which he presided, the Papal court having been transferred to Avignon), and his own decretals before and after that date, were collected and published in 1313. They were almost immediately withdrawn again for revision, and were promulgated in their present form by his successor Pope John XXII. in 1317, under the name of *Constitutiones Clementis Papæ V. or Clementinæ*. The mode of citation is either by the chapter, the title-rubric, the words "in Clementinis," and the number of book and title (e.g., c. 1. de summa trin. in Clem. l. 1.), or by calling the chapter itself the *Clementina*, and adding its number, with the title-rubric, and numbers of book and title (e.g., Clem. 1., de summa trin. l. 1.).

(d.) The *Extravagantes*.—The *Clementinæ* were the last of the collections formally promulgated by the popes. In the 15th century the term *Corpus Juris Canonici* was applied to the body of law composed of the *Decretum* and

the collections of Gregory, Boniface, and Clement, as appears from the canons of the councils of Constance and Basel. The more important of the decretals omitted from the *Clementinæ* or issued subsequently (distinguished from those in the *Corpus Juris Canonici* by the name "Extravagantes") were circulated or added in the manuscripts as a supplement to the *Corpus Juris*, and studied along with it at the universities. Two collections of them were printed by Jean Chappuis in his edition of the *Corpus Juris Canonici*, published at Paris in 1500. The first, which was entitled *Extravagantes Joannis XXII.*, comprised twenty constitutions of that pope, arranged in fourteen titles. The second collection was called *Extravagantes Communes*, and consisted of 73 decretals issued in the period from Boniface VIII. to Sixtus V. (1298–1484), systematically arranged according to the traditional scheme of five books ("sed vacat liber quartus," devoted in previous compilations to the law of marriage), divided into titles and chapters. The following examples will explain the method of citing the first and second collections respectively:—c. un. Xvag. lo. xxii. 12, or (mentioning the rubric of the title) c. un. de penis in Extrav. lo. xxii. (12), and c. 2, Xvag. comm. III. 2, or (giving the title-rubric) c. 2, de præb. et dig. in Extrav. comm. III. 2. Neither collection was sanctioned as such; each decretal is independent, and authoritative *proprio vigore*. The two sets of *Extravagantes* being retained in subsequent editions have become by use and wont part of the *Corpus Juris Canonici*. They received a semi-official approval by being included in the edition revised by the *Correctores Romani* (a learned commission appointed by Pius IV. in 1563), and published as the authorized text by Pope Gregory XIII. in 1582.

The different portions of the *Corpus Juris Canonici* stand to each other in the relation of *lex prior* and *lex posterior*, so that in cases of contradiction the latest in date is preferred. The same rule is applied to the single *capita* or laws of the private collections (the *Decretum* and the *Extravagantes*), but not to those of the other books, which were published as official codes, and the different *capita* of which are all regarded as bearing the date of promulgation of the whole. A distinction is also made respecting the authority of the rubrics of the titles. Those found in the *Decretum*, irrespective of the fact that they are not the work of Gratian, have no sanction except that of usage; while in the decretals of Gregory, Boniface, and Clement the rubric (*rubrum*) has as much authority as the text (*nigrum*), both having been issued together. The *summaria*, or *summæ*, prefixed to the canons and chapters emanate from the glossators, and have no legislative authority. But they generally state the substance of the law correctly, and are useful for purposes of interpretation. The *Superscriptiones Capitulorum*, giving the source and date of a law, and in the case of each decretal, the person to whom it was addressed, are, so far as we know, in their original state, but are not to be depended upon in all cases. A few of Gregory's decretals, for instance, bear the dates 1235 and 1236, whereas we know they must have been pronounced prior to the promulgation of the collection in 1234. No decretal anterior to 1298 is of authority unless found in the *Decretum* or the collections of Gregory or Boniface. The *Clementinæ* and *Extravagantes*, on the contrary, are not exhaustive for the period they cover, and omission from them does not affect the credit of an otherwise genuine constitution. André (*Cours de Droit Canon*, 3^{re} éd., 1860, vol. iii. p. 151) gives a list of the apocryphal laws in the *Decretum* and Gregory's *Decretals*. They are more numerous in the former, owing to Gratian's having selected his materials from the older compilations instead of the original sources, many of which were lost, and are of no authority except so far as adopted by sub-

sequent church usage. But the few spurious decretals in Gregory's collection are of equal authority with the others, the whole having received the papal *imprimatur*. The constitutions in the *Liber Sextus*, *Clementinæ*, and *Extravagants* are all genuine.

Liber Septimus.

Institutiones Lancelotti.

The *Liber Septimus Decretalium*, which appears in a supplement to some editions of the *Corpus Juris*, is a mere private collection formed by Peter Matthæus, a lawyer of Lyons, in 1590. The *Institutiones Juris Canonici* of J. P. Lancelottus of Perugia are of the same character, but they form a useful and trustworthy compendium and are of considerable authority. They were written, as the author tells us in his preface, to complete the parallel between the two *Corpora Juris*, civil and canon. The *Decretum* of the canonists corresponded to the *Pandects* of the civilians; the *Decretals* of Gregory to the *Code*; the *Liber Sextus*, *Clementinis*, and *Extravagants* to the *Novels*. At the Pope's suggestion Lancelot undertook to supply a text-book corresponding to the *Institutes* of Justinian. He completed and published it in 1563, but official confirmation never followed.

Editions.

The latest and most correct edition of the *Corpus Juris Canonici* is by Æmilii L. Richter (2 vols. 4to, Leipsic, 1839), of which a second edition is in the press. But it has not superseded that of J. H. Boehmer (2 vols. 4to, Halle, 1747), which is rendered valuable by his notes and copious indices, and contains much useful supplementary matter, including the *Liber Septimus* and Lancelot's *Institutiones*.

III. MEDIEVAL HISTORY.—From the 12th century

Bologna University.

Bologna university possessed two faculties of law—a civil and a canon. The members of the latter were called *doctores decretorum* (a degree which required six years' previous study) corresponding to the *doctores legum* of the civil law. Those who graduated in both faculties were doctors *utriusque juris*. The students were classed as *canonistæ* or *decretistæ* and *civilistæ* or *legistæ*. The system of tuition was oral (*lecturæ*) with minute study of the original authorities. Explanatory notes (*glossæ*) were added by many of the

Glossators.

professors (hence called *glossatores*) to their copies of the text, written either on the margin or between the lines. These were transcribed along with the text in the manuscripts circulating among the students. Gradually the

Apparatus.

glosses took the shape of a consecutive commentary (*apparatus*) in which the author incorporated what was most valuable in the notes of his predecessors. One of these always came to be accepted as of more authority than the rest, and on that account was entitled in the manuscripts

Glossa Ordinaria.

Glossa Ordinaria, or simply *Glossa*. Such are the gloss on the *Decretum* by Joannes Teutonicus (1212), revised and supplemented by Bartholomæus Brixensis (of Brescia) in 1258, and that on Gregory's *Decretals* by Bernardus Parmensis (1266). The ordinary gloss of the *Liber Sextus* and *Clementines* is by Joannes Andreæ (1348), the author of the *Arbor Consanguinitatis et Affinitatis* since inserted in the *Decretum*. (The last edition of the *Corpus Juris Canonici*, with the gloss, was published in 1671, 3 vols. fol., Lyons, sumpt. Huguetan et Barbier.) Abridgments of the text, giving briefly the substance of the titles in their order, with cross references, were composed under the name

Summe.

Repetitiones.

of *Summe* or *Distinctiones*. The more intricate doctrines were explained in writings called *Repetitiones* at greater length than was suitable to the lecture-room. The law was also expounded by means of real or fictitious cases, of which digests were compiled (*casus*) for use by those who took part in the disputations or moots, which were regularly held (*questiones*). These were conducted by different professors on different days, and hence were often named from the days of the week *Dominicales*, *Mercuriales*, *Venerales*, &c. Collections were made of unsettled and controverted points (*Dissensiones Dominorum*) and of rules

or maxims of law (*Brocarda*, *Brocardica*, *Paræmia*, or *Brocards. Regulæ Juris*). In both faculties law was at this time cultivated in a thoroughly practical spirit, and their friendly rivalry and mutual influence were beneficial to both. The mode of study was similar in the other European schools, which were all modelled after those of Bologna or Paris.

The church was thus supplied by the universities with a well-educated class of lawyers for administering the business of the ecclesiastical courts—those institutions which contributed so much to the growth and renown of the canon law. Their development was gradual but steady. The primitive Christians, in pursuance of apostolic precept (1 Cor. vi. 1–6), submitted their disputes to the decision of their bishops, and it was enacted by several early councils that questions between churchmen should be settled by a spiritual tribunal. The episcopal jurisdiction was extended by Constantine to all matters which the contending parties agreed to submit to it. This so-called *Audientia Episcopalis* was confirmed by several later emperors, and the bishop's sentence was enforceable by the civil magistrate. By a law of Justinian, actions against the clergy were directed to be brought before the bishop in the first instance. In course of time the church-courts absorbed many departments of civil jurisdiction. All matters connected in the most distant way with the church or religious duties were deemed proper subjects for disposal by her tribunals. The clergy dispensed the sacraments, and their assistance was required on the occasion of baptisms, marriages, and deaths. Hence the *curiæ christianitatis* took cognizance of questions relating to legitimacy, marriage, and succession. They assumed jurisdiction over not only the clergy, but all who were under the obligation of religious vows (e.g., Crusaders), as well as widows and orphans (*personæ miserabiles*) and minors. In the department of criminal law they were particularly active, punishing both ecclesiastical and religious offences, such as heresy, simony, blasphemy, sacrilege, and violation of personal and social morality (adultery, bigamy, fraud, perjury). For the administration of this extended judicial system the church had to enact her own rules of procedure, which were generally a great improvement on those prevailing in the civil courts. In fact it was by no means an evil at that period of European history that the administration of the law should fall into the hands of the clergy, who were the best educated men of their time, and had many of them been trained as lawyers in the schools of Bologna and Paris. The Teutonic and Gothic codes were very imperfect in most branches of the law, and the civil and criminal procedure of the native tribunals was far from settled. Their criminal law was little more than an elaborate system of fines, graduated according to the race or rank of the victim or the criminal. Evidence in our sense of the word was unknown, and innocence could only rely for protection on compurgation, ordeal, or judicial combat. Hence the people were, during several centuries, well content to resort to the church courts. The exemption of the clergy from civil jurisdiction was in accordance with the Teutonic principle that a man should be tried by his peers. And the laity were thankful to take shelter behind the church from the fines and exactions of the feudal courts, which were inflicted less in the interests of justice than for the profit of the overlord.

In the domain of public law the influence of the church was conspicuous. She may be said to have originated modern international law. The ancient Romans regarded all foreigners as *hostes*. Christianity inculcated the principle of the brotherhood of nations. The popes acted as arbitrators between prince and prince, and between prince and people. They protected the weak against the strong, and right against might. The principle grew up

Ecclesiastical jurisdiction.

Audientia Episcopalis.

International law.

Constitutional law.

that international questions should be decided according to law and Christian morality, and that war, when inevitable, should be conducted according to recognized rules laid down in the interests of humanity. The system of church administration served as a model for that of the state, which in mediæval times was frequently controlled by ecclesiastics. The constitutional duties of a sovereign to his people were boldly asserted by the church. Kings were taught that there were obligations for discharging which they were responsible to God, and that if these were neglected their subjects might be absolved from their allegiance. In after times the enemies of the church borrowed some of their most effective weapons from her own armoury. The writers on the law of nature and of nations, who headed the rebellion against the encroachments of ecclesiastical jurisdiction, adopted many principles which are to be found in the *Corpus Juris Canonici*, where we may also trace the germs of some leading doctrines of the French Revolution.

The canon law suited the civilization of the Middle Ages. It was natural that a system, aiming to regulate the most important concerns of practical life, administered by courts which, though belonging to different nations, were under the control of one central authority, and developed under the direction of a succession of able legislators, such as Hildebrand and Innocent III., should take the lead in forming the character and reconciling the conflicting interests of the rising nationalities. The canon law was not so much an independent system of law as a method of selecting what was best from the existing systems, and transforming it, by the help of Christian morality and feeling, into one homogeneous, eclectic whole. Much of the Roman element in the common laws of Europe at the present day has descended indirectly through the canon law, though modern jurists are too apt to ignore this and express their obligations to the ancient sources alone.

The decline of the canon law kept pace with that of the church from which it sprang. The strife of popes and antipopes, the increased strength of national feeling prompting the prelates to take their sovereign's part in his quarrels with the papacy, the arrogance of the ecclesiastical courts, the Reformation, the French Revolution, in short, all those causes that weakened the church's power and influence, were prejudicial to the authority of the canon law. And now that every country in Europe possesses, if not a code, at all events a matured system of national law, the *Corpus Juris Canonici* possesses little more than an historical and scientific interest.

Germany.

IV. PRESENT AUTHORITY.—*Germany.*—The Canon Law is still the common law of both sections of the Christian church of Germany, and in purely religious and ecclesiastical questions affecting their internal affairs it is applicable, so far as not altered by modern church standards. Such are, for the Roman Catholics, the canons of the Tridentine (1545-1563) and Vatican (1869) councils, and the various concordats with the temporal power; for the Protestants, the evangelical confessions (Augsburg, &c.) and the *Conclusa Corporis Evangelicorum* (1653-1806). The relations of the different churches with the state are regulated exclusively by the law of the land. In a question of private law the canon law has no validity as an independent source. Till the end of last century both the civil and canon laws were by custom received as authoritative in Germany. They were applied universally in the civil courts, and the canon law as the *lex posterior* was preferred in case of conflict. These two systems, along with the feudal customs, were the three constituent elements of the common law or *Gemeines Recht*. The jurisdiction of the latter is now confined by the provisions of the modern codes to about one-third of Germany. Within that

area the *Corpus Juris Canonici* may be quoted to aid in interpreting a doubtful point of common law. In other words, it is of historical but not of legislative authority.

France.—The Constituent Assembly, after abolishing tithes and religious orders and secularizing church property, superseded the canon and all other laws for the government of the church by the *Constitution Civile du Clergé*, enacted in 1790. Finally, in 1793 the Convention suppressed altogether the Christian religion and its institutions. Since the restoration of the Church in the beginning of this century, both its internal government and external relations have been regulated exclusively by civil enactment, based on the concordat between Napoleon I. and Pope Pius VII. (1801), and the *Articles Organiques* which followed in 1802.

England.—The Canon Law is of no intrinsic obligation in England. The English people have in all ages shown a firm determination that neither the national church nor the national law should be subject to the Papal legislation or jurisdiction. As early as 1138 Archbishop Theobald of Canterbury brought over Vacarius and other learned ecclesiastics from Italy to introduce the study of civil and canon law into England. The bishops and clergy vigorously supported the new system so favourable to their order; but the nobility and laity generally adhered to the old common law with great pertinacity. The contest was practically decided when in the 13th century the Court of Common Pleas was fixed at Westminster. This brought together the practitioners in municipal law who had been, while the court was ambulatory, dispersed throughout the kingdom, and shortly afterwards the victory of common law was made secure by the establishment of the Inns of Court and Chancery for the education of youth in municipal law.

The system administered in the spiritual courts is known as "the king's ecclesiastical law." It is based on the canon law, a knowledge of which is highly useful to the English ecclesiastical lawyer. But only such portions of the canon law have been adopted as have been sanctioned by the national legatine and provincial constitutions, the statutes of the realm, and immemorial church usage.

The canon law, though not binding *proprio vigore*, is one of the sources of the common law of England. The rules for the descent of land, for instance, are borrowed wholly from that system. But England assimilated less of it than other countries, or than might have been adopted by herself with advantage. It was not that the English people considered the provisions of the canon law inferior to their own customs; they were as a rule entirely ignorant of it. But their struggles against appeals to Rome and other claims of ecclesiastical jurisdiction roused the feeling of the nation. They stoutly stood up for their common law, cumbersome and even barbarous in some respects as it was, not because they thought it perfect, but because they were resolved to manage their own concerns after their own fashion. At the parliament of Merton (1236) when the bishops proposed that legitimation by subsequent marriage should be legalized, alleging that holy church (that is, the canon law) sanctioned such legitimation, all the earls and barons, we are told, with one voice answered, "*Nolumus leges Angliæ mutari.*" This incident shows that even at that early date canon law was of no authority unless sanctioned by the law of the land for the decretal (c. 6, X. qui filii sint legitimi, iv. 17) alluded to by the bishop was addressed by Pope Alexander III. to the bishop of Exeter in 1172, and was incorporated in the Decretals of Gregory promulgated in 1234, two years before the parliament of Merton.

Scotland.—Several causes conduced to the provisions of Scotland the canon law being extensively adopted by the law of

Scotland. During the 16th and 17th centuries canon law was publicly taught in the Scottish universities; and from a very early period it was the custom of the Scottish youth to resort for purposes of study to foreign countries, whence many of them returned doctors in *utroque jure*. A wide jurisdiction was exercised by the consistorial courts, from which for many centuries an appeal to Rome was competent, and at one time half of the senators of the College of Justice were necessarily clerical, while all were learned in both civil and canon law. Conveyancing, moreover, was in the hands of clerical notaries, who, till 1469, were, like those of Europe generally, appointed exclusively by the emperor and the Pope. But though one of the *fontes juris Scotiæ*, canon law never was of itself authoritative in Scotland. In the canons of her national provincial councils (at whose yearly meetings representatives attended on behalf of the king) that country possessed a canon law of her own, which was recognized by the parliament and the popes, and enforced in the courts of law. Much of it, no doubt, was borrowed from the *Corpus Juris Canonici*, the Tridentine standards, and the English provincial canons. But the portions so adopted derived their authority from the Scottish Church. The general canon law, unless where it has been acknowledged by Act of Parliament, or a decision of the courts, or sanctioned by the canons of a provincial council, is only received in Scotland according to equity and expediency.

ADDITIONAL AUTHORITIES.—HISTORY AND LITERATURE:—Doujat, *Histoire du Droit Canonique*, Paris, 1677; Bickell, *Geschichte des Kirchenrechts*, vol. i. (never completed), Giessen, 1843; Rosshirt, *Geschichte des Rechts im Mittelalter*, vol. i. *Kanonisches Recht*, Mainz, 1846. The best bibliographical history when completed will be—Maassen, *Geschichte der Quellen und der Literatur des Canonischen Rechts im Abendlande bis zum Ausgange des Mittelalters*, vol. i. 1870. The Vienna Academy of Sciences have voted funds from the Savigny foundation to enable the author to visit foreign libraries for the purposes of his work, which contains in consequence the best account of the various MSS. The first volume comes down to, without including, the False Decretals. Four additional volumes are expected. The glossators and the mediæval universities are treated of in Savigny, *Geschichte des Römischen Rechts im Mittelalter*, vol. iii. 2d ed. 1834. The history and system of the constitution of the church is handled with great learning and acumen by Thomassin, *Antiquus et Nouvelle Discipline de l'Eglise*, Lyons, 1678, (same work in Latin, but differently arranged, *Vetus et Nova Eccl. Disc.*, Paris, 1688, 3 vols. fol.). Consult also Wasserschleben's articles in Herzog's *Real-Encyclopädie on Kanonen und Decretalensammlungen*, *Kanonisches Recht*, *Glossen und Glossatoren*, and the text-books mentioned below. **TEXT BOOKS:—**1. By Roman Catholic authors—Dorvatus (Doujat), *Prænotionum Canoniarum Libri Quinque*, Paris, 1687, modern ed. by Schott, Mitav. et Lips. 1776, 2 vols. 8vo; Van Espen, *Jus Ecclesiasticum Universum*, last ed. Mogunt. 1791, 3 vols. 4to; Gibert, *Corpus Juris Canonici per Regulas Naturæ Online Digestæ Expositi*, Col. Allobr., 1725, 3 vols. fol.; Lancelottus, *Institutiones Juris Canonici*, last ed. cum adnot. Ziegleri et Thomasi, Hal. 1716, 4 vols. 4to (the first ed. having been published in 1563, a few months before the dissolution of the Council of Trent, contains the law of the *Corpus juris canonici* without the modifications introduced by that council); Devoti, *Institutionum Canoniarum libri ix.*, first ed. Rom. 1781, 4 vols. last ed. Leodii, 1860, 2 vols.; Phillips, *Kirchenrecht* (ecclesiastical law), Regensburg, 7 vols. 8vo, 1845–72 (not yet completed); Schulte, *Das Katholische Kirchenrecht*, Giessen, 1856–60, 2 vols. 8vo; Rosshirt, *Kanonisches Recht*, Schaffhausen, 1857; Walter, *Lehrbuch des Kirchenrechts aller christlichen Confessionen*, 14th ed. Bonn, 1871. 2. By Protestant authors—Gisbertus Voëtius, *Politica Ecclesiastica*, Amsterdam, 1663–66, 4 vols. 4to; J. H. Boehmer, *Jus Ecclesiasticum Protestantium* (in the form of a commentary on Gregory's Decretals), 5th ed. Hal. 1756–63, 5 vols. 4to, and the same author's *Institutiones Juris Canonici*, 5th ed. Hal. 1770; Mejer, *Lehrbuch des Deutschen Kirchenrechts*, 3d ed. Göttingen, 1869; Richter, *Lehrbuch des katholischen und evangelischen Kirchenrechts*, 7th ed. by Dove, Leipzig, 1874. **DICTIONARIES:—**Durand de Maillane, *Dictionnaire Canonique*, last ed. 1759, 6 vols. 8vo;¹ Ferraris, *Promptua Bibliotheca Canonica, Juridica*, &c., Abbé Migne's ed. 8 vols. 1866; André, *Cours Alphabétique et Méthodique de Droit*

Canon, 3d ed. 6 vols. 8vo, Paris, 1860. Excellent articles on subjects relating to canon law are contained in Wetzer und Welte, *Kirchenlexicon oder Encyclopädie der katholischen Theologie*, Freiburg, 1847–56, 13 vols. 8vo, and Herzog, *Real-Encyclopädie für protestantische Theologie und Kirche*, 1854–68, 22 vols. 8vo. **FALSE DECRETALS:—**The latest criticism is by Hinschius, *Commentatio de Collectione Isidori Mercatoris* (prefixed to his ed. of the work, Lipsie, 1863), and art. *Pseudo-Isidor* by Wasserschleben in Herzog's *Real-Encyclopädie* (xii. 337), 1860, and by Hebele in Wetzer und Welte's *Kirchenlexicon* (viii. 849), 1852. The text-books of Phillips, Schulte, Walter, Richter, &c., give a *résumé* of the different views. The older authorities are—*Ecclesiastica Historia*, &c. (known as the Magdeburg Centuries, 13 vols. fol.), Basil. 1559–74, vol. ii. c. 7, and vol. iii. c. 7; F. Turrianus, *Adversus Magdeburgenses Centuriatores*, &c., Florent. 1572; Blondellus, *Pseudoisidorus et Turrianus Vapulantes*, Genæ. 1628; Gallandius, *De Vetus Canonum Collectionibus Sylloge* (2 vols. 4to), Mogunt. 1790, vol. i. p. 528, and vol. ii. p. 1 (dissertations by the brothers Balerini and Car. Blascus); Knust, *De Fontibus et Consilio Pseudoisidorianæ Collectionis*, Götting, 1832; Rosshirt, *Zu den kirchenrechtlichen Quellen des ersten Jahrtausends und zu den Pseudoisidorischen Decretalen*, Heidelb. 1849. **CANON LAW IN ENGLAND:—**Sir Matthew Hale's *History of the Common Law*, chap. 2 (6th ed. by Runnington, 1820); Reeve's *Hist. of the English Law*, chaps. 25 and 26 (new ed. by Finlason, 1869, 3 vols.); Introductions to Blackstone's *Commentaries*; Burn's *Ecclesiastical Law* (9th ed. by Phillimore, 4 vols. 1842), and Phillimore's *Ecclesiastical Law of the Church of England* (2 vols. 1873); Bowyer's *Readings before the Society of the Middle Temple*, 1851, lectures 12 to 15; *The Queen v. Millis*, 1844, 10 Clark and Fennelly's House of Lords Reports, 534; *Martin v. Mackonochie* and *Flamank v. Simpson*, 1868, Law Reports, 2 Admiralty and Ecclesiastical, 116; *The Queen v. the Archbishop of Canterbury*, 1848, 11 Adolphus and Ellis's Queen's Bench Reports, new series, 483; *Marshall v. the Bishop of Exeter*, 1860, 29 Law Journal, new series, Common Pleas, 354. **CANON LAW IN SCOTLAND:—**Lord Stair's *Institutions*, bk. i. tit. i. secs. 14 and 16; Ferguson's *Consistorial Law*, 1829, p. 2; Riddell's *Scottish Peerage and Consistorial Law*, 1842, vol. i. p. 449; Introduction to Fraser's *Law of Husband and Wife*, 2 vols. 1876; Mr Joseph Robertson's preface to *Ecclesiæ Scotiæ Statuta*, 2 vols. 4to., 1866 (Bannatyne Club); Bell's *Report of a Case of Legitimacy under a Putative Marriage*, 1825; Lord Medwyn's opinion in the Marnoch case (*Cruickshank v. Gordon*), 10th March, 1843–45; Dunlop's Court of Session Reports, 941. (W. F. H.)

CANONICAL, as an adjective, is found associated with many substantives, and always implies dependence, real or supposed, upon the canons of the church. Thus we read of "canonical obedience," as signifying the obedience recognized as due to a superior officer of the church from an inferior, as that due to a bishop from a presbyter. Perhaps the best known and most widely spread use of the term occurs in the case of *Canonical Hours*, otherwise called *Hours of Prayer*, which are certain stated times of the day, consigned in the East, and in the West before the Reformation, more especially by the Church of Rome, to offices of prayer and devotion. These were at first three only, and were supposed to be inherited from the Jewish Church (see Psalm lv. 17, Dan. vi. 10, and Acts iii. 1),—namely, the third, sixth, and ninth hours, corresponding to 9 A.M., noon, and 3 P.M. with us. They were increased to five, and subsequently to seven (see Psalm cxix. 164), and in time made obligatory on monastic and clerical bodies. The full list, recognized almost universally throughout Europe before 700 A.D., stands thus:—Matins (called also *Matin Lauds*, or simply *Lauds*), Prime, Terce, Sext, Nones, Evensong, Compline; in the Saxon canons of Ælfric, *Uhtsang*, *Primsang*, *Undersang*, *Middaysang*, *Nonsang*, *Æfensang*, *Nihtsang*. (See Du Cange, *Glossarium*, s. v. "Horæ Canonice;" Durandus, *De Off. Divin.*, lib. v., Smith and Cheetham's *Dictionary of Christian Antiquities*, art. "Hours of Prayer.") Bishop Cosin, in the reign of Charles I., put forth an edition of the *Hours* (as books of devotion for the canonical hours are often called) for the use of such individuals or bodies of the English Church as might like to use them.

CANONIZATION, a ceremony in the Church of Rome, by which persons deceased are ranked in the catalogue of the saints. This act is preceded by beatification; and

¹ The authority of this and most other French writers on canon law is to be received with caution on matters having any connection with the Gallican Liberties.

after the merits of the individual have been duly tested and approved, the Pope decrees the canonization.

The term was not introduced till the 12th century. The first person who availed himself of it was Udalric, bishop of Constance, in his letter to Pope Calixtus II. relative to the canonization of Bishop Conrad. The act, however, dates from a much more remote antiquity. The ceremony was originally only a commemoration of the martyrs, whose assistance was invoked in the name of the church militant to which they had belonged. Originally bishops decided whether or not the candidate had fairly vindicated his claim to the honour; but they only acted as the organ of public opinion. Orthodoxy was certainly considered of great importance, as may be seen from the fact of the exclusion of Origen and Tertullian, those great though erratic geniuses of the early church, from the title. As soon as the power of Rome was once more upon the ascendant in Europe, the popes naturally appropriated to themselves the important privilege of canonization. None but martyrs were at first admitted into the category of saints, but in course of time the privilege was extended to some of those pious men who, without having sealed their testimony with their blood, had evinced the sincerity of their belief by the purity of their practice. In later times, however, the Pope assumed the right of admitting into the sacred catalogue potentates whose claim seems to have largely consisted in their support of his temporal interests. Notable instances of this are the names of the emperor Henry I., canonized by Eugenius III., and Edward the Confessor of England, canonized by Alexander III.

So long as the right of according the honours of canonization was vested in the bishops, there was no public guarantee that it had been exercised with rigour or discretion. But when it passed into the hands of the popes, means were taken to prevent any but really meritorious persons from being enrolled in the holy category. Even then, however, a very simple ordeal sufficed. A few miracles reported to have happened at a tomb were enough to give its inmate a claim to have his name inscribed in the canon of the mass among the number of the happy. A Roman Catholic writer, the editor of Butler's *Lives of the Saints* (ed. 1866) states that "the proceedings of a beatification or canonization are long, rigorous, and expensive." It has been asserted that the discovery of the last-named feature of the process prevented the somewhat parsimonious Henry VII. of England from carrying out his desire for the canonization of King Henry VI.; Bacon, however (*History of Henry VII.*), inclines rather to the belief that the obstacle here was the pope's fear it would "diminish the estimation of that kind of honour" to give it to such "a simple man." At a later period, when the ceremony was only performed after a considerable lapse of time, reasons were always hard to be found why the saintly candidate should be rejected. In modern times the court of Rome has shown itself extremely averse to promiscuous canonization; and since the days of Benedict XIV., the promoter of the faith, popularly known as the *advocatus diaboli*, or devil's advocate, has exercised extreme severity in sifting the claims of aspirants. It is further necessary that a period of a hundred years should elapse between the death of the saint and his admission into the calendar. But the more pious men of every country in Europe have of late evinced so little ambition to secure this posthumous compliment, that it may now be considered to have gone fairly out of fashion. It is also probable that the far more stringent rules of evidence and the growth of physical science have tended to render proof of the supernatural much more difficult than it seemed to be to our mediæval forefathers. It may be observed that the Lutheran divines of the century after the Reformer's

decease frequently refer to him as B. (*i.e.*, *Beatus*) Lutherus.

On the day of canonization the Pope and cardinals officiate in white; while St Peter's church is illuminated and hung with rich tapestry, upon which the arms of the Pope, and of the prince or state requiring the canonization, are embroidered in gold and silver.

Beatification, which frequently precedes canonization, gives an inferior *status* to the deceased person, and appears rather to recommend him as a fit object for the *cultus* of his co-religionists than to enjoin it.

See Du Cange *Glossarium*, s. v. "Canonizare," and the references there given to St Augustine on St John, the Bull of Pope John XV., and (for the ceremonies) to the *Ceremoniale Romanum*, lib. i. sect. 16. Compare Milman, *Lat. Christianity*, bk. xiv. chap. ii., and preface to Forbes's *Kalendar of Scottish Saints*, 1872. For the Roman Catholic statement of the case see Alban Butler's *Lives of the Saints*, preface to edition of 1866, and an *Essay on Beatification, Canonization, &c.*, by F. W. Faber (London, 1848). But the great authorities on the subject to which all Roman Catholics refer are the decrees of Pope Urban VIII., and a treatise on the entire subject by Pope Benedict XIV.

CANOPUS, or CANOBUS, in ancient geography, a town of Lower Egypt, on the Mediterranean, a hundred and twenty stadia, or fifteen miles, to the east of Alexandria. It contained a very popular shrine of the god Serapis; and was the seat of the manufacture of henna, the scarlet dye with which women in the East colour their nails. The town was notorious for its dissoluteness; and as Alexandria rose into eminence, it gradually declined. All that remains is a heap of ruins. Canopus, the pilot of Menelaus, is said to have died in Egypt, and to have given his name to the town.

CANOSA, or CANUSIUM, a city of Italy, in the province of Terra di Bari, and district of Barletta, situated on the slope of an eminence on the right bank of the Aufidus or Ofanto, about 15 miles from the sea, and 6 miles from the battlefield of Cannæ. Its most interesting buildings of modern date are a feudal castle on the top of the hill, and the church of St Sabinus the patron saint of the city, with its mosque-like cupolas and ancient pulpit. In the neighbourhood of the latter stands the tomb of Bohemond of Antioch, who died in 1102. The ruins of the old Roman city extend for a considerable distance beyond the modern town; large portions of its walls can still be traced; and there are extensive remains of an amphitheatre which was larger than that of Pompeii, and a gateway, frequently described as a triumphal arch, dedicated to Trajan. Various explorations have brought to light great numbers of vases, inscriptions, and miscellaneous antiquities, among which is a complete list of the members of the municipal senate. The vases, which have been principally derived from the sepulchres excavated in the tufa rock which were discovered about 1803, are large in size and somewhat coarse in workmanship. (See Millin, *Description des tombeaux de Canosa*, Paris, 1813.) Like several of the more important cities in this part of Italy, Canusium is said to have been founded by the Grecian hero Diomedes; the origin of the city, however, can be traced with tolerable certainty to the Pelasgi. Canusium is first mentioned in history as assisting the Samnites in their wars against the Romans, by whom it was subdued for the first time 318 B.C. In the second Punic war the inhabitants gave shelter within their walls to the remnant of the Roman army, which retreated thither after the rout at Cannæ. In the second year of the social war, in which Canusium joined the revolted allies, it was besieged unsuccessfully by the Romans. In the civil wars it suffered severely, but always contrived to preserve its municipal privileges, and was never

tions of grandeur and of truth. The Theseus was regarded with rapturous admiration.

Canova's next undertaking was a monument in honour of Clement XIV.; but before he proceeded with it he deemed it necessary to request permission from the Venetian senate, whose servant he considered himself to be, in consideration of the pension. This he solicited in person, and it was granted. He returned immediately to Rome, and opened his celebrated studio in the Via del Babuino. He spent about two years of unremitting toil in arranging the design and composing the models for the tomb of the pontiff. After these were completed, other two years were employed in finishing the monument, and it was finally opened to public inspection in 1787. The work, in the opinion of enthusiastic *dilettanti*, stamped the author as the first artist of modern times. After five years of incessant labour, he completed another cenotaph to the memory of Clement XIII., which raised his fame still higher. Works now came rapidly from his chisel. Amongst those which belong to the period in question is Psyche, with a butterfly, which is placed on the left hand, and held by the wings with the right. This figure, which is intended as a personification of man's immaterial part, is considered as in almost every respect the most faultless and classical of Canova's works. In two different groups, and with opposite expression, the sculptor has represented Cupid with his bride; in the one they are standing, in the other recumbent. These and other works raised his reputation so high that the most flattering offers were sent him from the Russian court to induce him to remove to St Petersburg, but these were declined. "Italy," says he, in writing of the occurrence to a friend, "Italy is my country—is the country and native soil of the arts. I cannot leave her; my infancy was nurtured here. If my poor talents can be useful in any other land, they must be of some utility to Italy; and ought not her claim to be preferred to all others?"

Numerous works were produced in the years 1795-97, of which several were repetitions of previous productions. It is only necessary to notice the celebrated group representing the Parting of Venus and Adonis. This famous production was sent to Naples. The French Revolution was now extending its shocks over Italy; and Canova sought obscurity and repose in his native Passagno. Thither he retired in 1798, and there he continued for about a year, principally employed in painting, of which art also he had some knowledge. He executed upwards of twenty paintings about this time. One of his productions is a picture representing the dead body of the Saviour just removed from the cross, surrounded by the three Marys, the beloved disciple, Joseph of Arimathea, and, somewhat in the background, Nicodemus. Above appears the Father, with the mystic dove in the centre of a glory, and surrounded by a circle of cherubs. This composition, which was greatly applauded, he presented to the parochial church of his native place. Events in the political world having come to a temporary halt, he returned to Rome; but his health having been impaired from arduous application, he took a journey through a part of Germany, in company with his friend Prince Rezzonico. He returned from his travels much improved, and again commenced his labours with renewed vigour and enthusiasm.

Canova's sculptures have been distributed under three heads:—(1) Heroic compositions; (2) Compositions of grace and elegance; and (3) Sepulchral monuments and reliefs. In noticing the works which fall under each of these divisions, it will be impossible to maintain a strict chronological order, but perhaps a better idea of his productions may thus be obtained. Their vast number, however, prevents their being all enumerated.

Soon after his return appeared his Perseus with the Head of Medusa. The moment of representation is when the hero, flushed with conquest, displays the head of the "snaky Gorgon," whilst the right hand grasps a sword of singular device. By a public decree, this work was placed in one of the *stanze* of the Vatican hitherto reserved for the most precious works of antiquity; but it would be a mistake to say that it sustains this comparison, or that it rivals the earlier realization of the same subject in Italian art, that by Cellini. In 1802, at the personal request of Napoleon, Canova repaired to Paris to model a bust of the First Consul. The artist was entertained with munificence, and various honours were conferred upon him. The statue, which is colossal, was not finished till six years after. On the fall of the great Napoleon, Louis XVIII. presented this statue to the British Government, by whom it was afterwards given to the duke of Wellington. Palamides, Creugas and Damoxenus, the Combat of Theseus and the Centaur, and Hercules and Lichas may close the class of heroic compositions, although the catalogue might be swelled by the enumeration of various others, such as Hector and Ajax, and the statues of Washington, King Ferdinand of Naples, and others. The group of Hercules and Lichas is considered as the most terrible conception of Canova's mind, and in its peculiar style as scarcely to be excelled.

Under the second head, namely, compositions of grace and elegance, the statue of Hebe takes the first place in point of date. Four times has the artist embodied in stone the goddess of youth, and each time with some variation. The only material improvement, however, is the substitution of a support more suitable to the simplicity of the art. Each of the statues is, in all its details, in expression, attitude, and delicacy of finish, strikingly elegant. The Dancing Nymphs maintain a character similar to that of the Hebe. The Graces and the Venus are more elevated. The Awakened Nymph is another work of uncommon beauty. The Mother of Napoleon, his consort Maria Louisa (as Concord), to model whom the author made a further journey to Paris in 1810, the Princess Esterhazy, and the muse Polymnia (Elisa Bonaparte) take their place in this class, as do the ideal heads, comprising Corinna, Sappho, Laura, Beatrice, and Helen of Troy.

The cenotaphs and funeral monuments fall next to be noticed. Of these the most splendid is the monument to the Archduchess Maria Christina of Austria, consisting of nine figures. Besides the two for the Roman pontiffs already mentioned, there is one for Alfieri, another for Emo, a Venetian admiral, and a small model of a cenotaph for Nelson, besides a great variety of monumental reliefs.

The events which marked the life of the artist, during the first fifteen years of the period in which he was engaged on the above-mentioned works, are of so little importance as scarcely to merit notice. His mind was entirely absorbed in the labours of his studio, and, with the exception of his journeys to Paris, one to Vienna, and a few short intervals of absence in Florence and other parts of Italy, he never quitted Rome. In his own words, "his statues were the sole proofs of his civil existence." There was, however, another proof, which modesty forbade him to mention, an ever-active benevolence, especially towards artists. In 1815 he was commissioned by the Pope to superintend the transmission from Paris of those works of art which had formerly been conveyed thither under the direction of Napoleon. By his zeal and exertions, for there were many conflicting interests to reconcile, he adjusted the affair in a manner at once creditable to his judgment and fortunate for his country. In the autumn of this year he gratified a wish he had long entertained of visiting London, where he

received the highest tokens of esteem. The artist for whom he showed particular sympathy and regard in London was Haydon, who might at the time be counted the sole representative of historical painting there, and whom he especially honoured for his championship of the Elgin marbles, then recently transported to England, and ignorantly depreciated by polite connoisseurs. Canova returned to Rome in the beginning of 1816, with the ransomed spoils of his country's genius. Immediately after, he received several marks of distinction,—by the hand of the Pope himself his name was inscribed in "the Golden Volume of the Capitol," and he received the title of marquis of Ischia, with an annual pension of 3000 crowns, about £625.

He now contemplated a great work, a colossal statue of Religion. The model filled Italy with admiration; the marble was procured, and the chisel of the sculptor ready to be applied to it, when the jealousy of churchmen as to the site, or some other cause, deprived the country of the projected work. The mind of Canova was inspired with the warmest sense of devotion, and though foiled in this instance he resolved to consecrate a shrine to the cause. In his native village he began to make preparations for erecting a temple which was to contain, not only the above statue, but other works of his own; within its precincts were to repose also the ashes of the founder. Accordingly, in prosecution of this design, he repaired to Passagno in 1819. At a sumptuous entertainment which he gave to his workmen, there occurred an incident which marks the kindness of his character. When the festivities of the day had terminated, he requested the shepherdesses and peasant-girls of the adjacent hamlets to pass in review before him, and to each he made a present, expending on the occasion about £400. We need not therefore be surprised that a few years afterwards, when the remains of the donor came to be deposited in their last asylum, the grief which the surrounding peasantry evinced was in natural expression so intense and irrepressible as to eclipse the studied solemnity of more pompous mourning.

After the foundation-stone of this edifice had been laid, Canova returned to Rome; but every succeeding autumn he continued to visit Passagno, in order to direct the workmen, and encourage them with pecuniary rewards and medals. In the meantime the vast expenditure exhausted his resources, and compelled him to labour with unceasing assiduity when age and disease had set their seal upon his frame. During the period which intervened between commencing operations at Passagno and his decease, he executed or finished some of his most striking works. Amongst these were the group Mars and Venus, the colossal figure of Pius VI., the Pietà, the St John, the recumbent Magdalen. The last performance which issued from his hand was a colossal bust of his friend the Count Cicognara. In May 1822 he paid a visit to Naples, to superintend the construction of wax moulds for an equestrian statue of the perjured Bourbon king Ferdinand. This journey materially injured his health, but he rallied again on his return to Rome. Towards the latter end of the year he paid his annual visit to the place of his birth, when he experienced a relapse. He proceeded to Venice, and expired there on the 13th of October 1822, at the age of nearly sixty-five. His disease was one which had affected him from an early age, caused by the continual use of carving-tools, producing a depression of the ribs. The most distinguished funeral honours were paid to his remains, which were deposited in the temple at Passagno on the 25th of the same month.

Canova, in a certain sense, renovated the art of sculpture in Italy, and brought it back to that standard from which it had declined when the sense both of classical beauty

and moderation, and of Titanic invention and human or superhuman energy as embodied by the unexampled genius of Michelangelo, had succumbed to the overloaded and flabby mannerisms of the 17th and 18th centuries. His finishing was refined, and he had a special method of giving a mellow and soft appearance to the marble. He formed his models of the same size as the work he designed was intended to be. The prominent defect of Canova's attractive and highly trained art is that which may be summed up in the word artificiality,—that quality, so characteristic of the modern mind, which seizes upon certain properties of conception and execution in the art of the past, and upon certain types of beauty or emotion in life, and makes a compound of the two—regulating both by the standard of taste prevalent in contemporary "high society," a standard which, referring to cultivation and refinement as its higher term, declines towards fashion as the lower. Of his moral character a generous and unwearied benevolence formed the most prominent feature. The greater part of the vast fortune realized by his works was distributed in acts of this description. He established prizes for artists and endowed all the academies of Rome. The aged and unfortunate were also the objects of his peculiar solicitude. His titles were numerous. He was enrolled amongst the nobility of several states, decorated with various orders of knighthood, and associated in the highest professional honours. (See the *Life of Canova* by Memes, one vol.; that by Missinini, four vols.; the *Biografia*, by the Count Cicognara; and *Opere Scelte di Antonio Canova*, by Anselmi, Naples, 1842.) (W. M. R.)

CANSTATT, CANNSTADT, or KANSTATT, a town of Württemberg, in the circle of the Neckar, about 2½ miles N.E. of Stuttgart, in 48° 48' 22" N. lat. and 9° 12' 49" E. long. It is situated in the most fertile and populous part of the country, at a point where the high roads of the circle converge, and now forms one of the most flourishing towns in Germany. Its public buildings comprise a cathedral of the 15th century, dedicated to Uffo, a beautiful town-hall, the royal theatre, the market-house, and various educational institutions. The Wilhelma palace, built in 1842–51 as a summer residence for the late king William, is an elaborate example of the Saracenic style, and is surrounded by extensive and beautiful gardens. A very considerable industry is carried on in the town,—the most important branches being wool-spinning, dyeing, cotton-weaving, and the manufacture of steel and machines. The transit trade is still more important and various. A large temporary population is attracted to the town by the fame of its mineral springs. These are about forty in number, for the most part of tepid water, which is used both for drinking and bathing, and is said to be highly beneficial in dyspepsia and weakness of the nervous system. Besides the usual bathing establishments, there are several medical institutions for the treatment of special diseases. Sielberg, a hill in the neighbourhood, upwards of 600 feet in height, is interesting for its caverns and the numerous fossils which it has preserved. Not far distant is the princely seat of Rosenstein (previously known as Kahlenstein), which was built in 1824–30; and on the neighbouring height of the Rothenberg was formerly the ancestral castle of the house of Württemberg. Canstatt is mentioned as early as the 8th century, under the name of Condistat, as the seat of a great court held by Charlemagne for the trial of the rebellious dukes of Alemannia and Bavaria. From Louis the Bavarian it received the same imperial rights and privileges as were enjoyed by the town of Esslingen. Down to the middle of the 15th century it remained the capital of Württemberg; and as an important place of transport it has been frequently the object of military operations. In

1755, at the time of the great earthquake at Lisbon, part of the town-house subsided 3 feet. Population in 1871, 11,804.

CANSTEIN, KARL HILDEBRAND, COUNT OF (1667–1719), was born at Lindenberg, in 1667. He studied law at Frankfort, travelled in Italy and England, and served in one campaign; but his health failing, he was obliged to retire into private life. At Berlin he became acquainted with Spener and Francke, whose influence determined him to devote his energies and time to further the circulation of the Bible. For this he obtained a large amount of money by subscription, and established at Halle the Bible Society which is named after him. In 1712, with the aid of Francke, he issued a stereotype edition of the New Testament at about fourpence a copy, and next year a similar edition of the whole Bible. In 1722 editions in Polish and Bohemian appeared. Canstein is the author of a *Life of Spener*, a *Harmony of the Gospels*, and several theological works. He is, besides, one of those to whom the introduction of stereotype printing has been ascribed.

CANTABRIA, a district of Hispania Tarraconensis, lying on the south coast of the Bay of Biscay. By the more ancient geographers the name was applied to the entire country now occupied by the provinces of Asturias, Santander, Biscay, and Guipuzcoa. After the conquest of Spain by the Romans, the name of Cantabria was restricted to what is now the province of Santander and the eastern portion of Asturias.

The Cantabri were not improbably the remains of an ancient Iberian population, and were, according to some, the ancestors of the modern Basques. They were the most warlike of all the native Spanish tribes that the Romans had to encounter, and were never completely subdued. Together with the Astures, they offered for many ages a successful resistance to the Roman arms, and were only at last compelled to acknowledge the supremacy of Rome by Augustus. They revolted a few years after, but were defeated with great slaughter by Agrippa, 19 B.C. When, however, their losses had been somewhat repaired, they again declared war; and they were only kept in check by the most vigorous exertions of the Emperor Tiberius. Their indomitable spirit is frequently alluded to in the ancient classics; among others Horace alludes to the "*Cantabrum indoctum juga ferre nostra*." Cantabria under the Roman empire comprehended five principal tribes,—the Plentauri, the Varduli, the Autrigones, the Conisei or Concani (who fed on the blood of their horses,—"*latum equino sanguine Concanum*"), and the Tuisi. There were numerous towns and villages distributed throughout the country, of which the most important was Juliobriga.

CANTACUZENUS, JOHANNES, emperor of the East, celebrated as a statesman, general, and historian, was born at Constantinople, of an ancient and opulent family, and under the reign of the elder Andronicus held the high office of Great Domestic. In the disputes that ensued between that emperor and his grandson, Cantacuzenus espoused the cause of the latter; and when Andronicus II., on the abdication of his grandfather, ascended the throne (1328) he was entrusted with the supreme administration of affairs, in which capacity he displayed considerable vigour and ability. On the death of the emperor in 1341, Cantacuzenus was left regent, and guardian of his son John Palæologus, who was but nine years of age. Whether he would have continued faithful to his trust is uncertain; but being suspected by the empress, and the object of the hostility of a powerful party at court, he rebelled, and got himself crowned emperor in one of the provincial towns, while his opponents, with the young emperor John, maintained themselves at Constantinople. The civil war

which ensued lasted six years; and as the rival parties were obliged to call in the aid of the Servians and Turks, and to engage mercenaries of every description, the empire was reduced to a state of incredible confusion, and nearly ruined. At the outset Cantacuzenus was so hard pressed that he was obliged to flee into Servia. An alliance with Servia enabled him to make head against his enemies for some time; but his inconstant allies soon left him to join the other side, or to pursue their own private ends. It was with the help of the Turks that he brought the war to a termination. He formed an alliance with Orhan, the Ottoman Sultan of Broussa, on the disgraceful conditions of sending his daughter to the harem of the Turk, and of allowing his army to make slaves of the Greek subjects. In 1346 he entered Constantinople in triumph, and forced his opponents to an arrangement by which he became joint emperor with John Palæologus, retaining the administrative power in his own hands during the minority of his colleague. It is impossible to give a connected view of the government of Cantacuzenus. The empire, already broken up into disconnected fragments, and reduced to the narrowest limits, was assailed on every side by open enemies or treacherous friends. There were wars with the Genoese, who had a colony at Galata and had money transactions with the court, and with the Servians, who were at that time establishing an extensive empire on the north-western frontiers,—carried on in every case without energy and without happy result; and there was a hazardous alliance with the Turks, who made their first permanent settlement in Europe, at Callipolis, in Thrace, towards the end of the reign of Cantacuzenus (1354). It would be wrong to blame him, however, for introducing those enemies of Christendom into Europe, as they had been in the habit of interposing in the unhappy struggles of the Greek empire. No individual energy could have saved a moribund state from destruction at the hands of its more vigorous neighbours. Yet Cantacuzenus was far too ready to employ them in his European quarrels; and as he had not money to pay them, this gave them a ready pretext for seizing upon a European town. The financial burdens imposed by Cantacuzenus had long been displeasing to his subjects, and there had always been a strong faction in favour of John Palæologus. Hence, when the latter entered Constantinople in the end of 1354, his success was easy. Cantacuzenus retired to a monastery, where he occupied himself in literary labours. He wrote a history of his own life and times, which has been incorporated in the series of Byzantine historians. Cantacuzenus was not without ability, and had some literary merit and even eloquence, but with a considerable share of the Byzantine vices,—timidity, duplicity, and falsity.

CANTAGALLO, a town of Brazil, in the province of Rio de Janeiro, about 80 miles N.E. of the city of that name, on a small tributary of the Parahyba, with a station on the railway from Rio de Janeiro to Campos. It was formerly the seat of important gold mines; but, since these were worked out, it has depended almost wholly on agriculture. Population about 4200.

CANTAL, a department in central France, lying between 44° 37' and 45° 26' N. lat., and between 2° 3' and 3° 18' E. long., bounded N. by the department of Puy-de-Dôme, and E. by Haute-Loire and Lozère, S. by Aveyron and Lozère, and W. by Corrèze and Lot. Its area is 2208 square miles; and its population in 1872 was 231,867.

It is formed of the ancient province of Upper Auvergne, and received its name from the Plomb-du-Cantal, the central peak of a bare and rugged chain which traverses the whole department. Near the Plomb, which attains a height of above 6090 feet, are the Col-de-Cabre and other peaks belonging to the same system, evidently of

district registries at Canterbury for the probate and bankruptcy divisions.

Canterbury contains a cathedral church, the seat of an archbishop, who is primate of all England and metropolitan, and provincial of the dioceses south of Trent,—his own diocese comprising the greater part of Kent and a small piece of Surrey. The cathedral staff consists of a dean, six canons, twenty-four honorary canons, an auditor, six preachers, four minor canons, and subordinate officers; and attached to it is a school founded by Henry VIII., and called the king's school, comprising a foundation for two masters and fifty scholars, with a few exhibitions also. The cathedral library contains about 9000 volumes, and is rich in ancient charters and registers of the monastery. Besides the cathedral there are fifteen parish churches, and places of worship for Roman Catholics, Jews, Unitarians, Independents, Baptists, Wesleyans, Lady Huntingdon's congregation, and the Society of Friends. In the crypt of the cathedral there is also a church founded by Queen Elizabeth for French Protestant refugees, and still used by a small French congregation. A college for the education of missionary clergy of the Church of England was founded by Royal Charter in 1848 on the ruins of St Augustine's abbey; and on St Thomas Hill in the suburbs is the boys' school of the Clergy Orphan Corporation. The principal public buildings are the Guild Hall, the Corn Exchange with market-place below, the Museum, the Kent and Canterbury Hospital, an institution for upwards of 100 patients, and the gaol, which is for the eastern division of the county, with the county court-hall adjoining. The city contains barracks for horse, foot, and artillery,—that for cavalry being used for depôts of regiments on foreign service, and that for infantry as the brigade depôt of the 3rd regiment (Buffs) and the East Kent regiment, and as the headquarters of the East Kent militia. The trade of Canterbury comprises good markets for hops and corn, but has no other speciality. There are some pleasant public gardens known as the Dane-John Walks. The suburbs and neighbourhood are favourite spots for residence.

Canterbury returns two members to Parliament, the constituency being 2794 (revision 1875). The population in 1871 was 20,962, and the number of houses 4102.

Canterbury occupies the site of the Roman *Durovernum*, a city established upon that ford of the River Stour at which roads from the three Kentish harbour-fortresses, *Rutupie*, *Dubree*, and *Lemanæ* (now Richborough, Dover, and Lympne) became united into the one great military way through Britain, known in later days as Watling Street. From this ford the city apparently derived its name, the first syllable of which is the Celtic *dwr*, "water." The Romans do not seem, at least towards the end of their occupation, to have made it a military centre, or given it a permanent garrison; but, as a halting-place for troops on the march, and commercially, as lying in the direct path of all the Continental traffic of Britain, its importance at this date must have been considerable. The city reappears, under its new name of *Cantwarabyrig* (since shortened to the present word), as the capital of Ethelbert, the fourth Saxon king of Kent, during the latter part of whose reign it became in a manner the metropolis of England,—the office of Bretwalda, or overlord, of the island to the Humber being held by Ethelbert. It was in this reign (in 596) and under these circumstances that Augustine and his fellow-missionaries arrived from Rome, and their settlement by Ethelbert in his capital became the origin of its position, held ever since, as the metropolis of the English Church. Its history from this time becomes chiefly ecclesiastical. Here lived and ruled Augustine and the succeeding archbishops, and here under their auspices, from the time of Ethelbert and Augustine downwards,

arose two of the principal monasteries of England, the abbey of St Augustine and the priory of Christ Church,—the latter ruled by a prior only, as acknowledging the archbishop for its abbot. These were long rivals in importance and wealth, in which the abbey held for several centuries the advantage, as possessing the shrines of the earlier archbishops, the chief saints of the English Church, till the pre-eminence of the priory in turn became decidedly established by the murder of Archbishop Becket (1170) in its cathedral church, his canonization as St Thomas of Canterbury, and the resort of the Christian world on pilgrimage to his shrine. Miracles were almost immediately said to be worked at his grave in the crypt, and at the well in which his garments had been washed; and from the time when Henry II. did his penance for the murder in the church, and the battle of Alnwick was gained over the Scots a few days afterwards—it was supposed as a result—the fame of the martyr's power and the popularity of his worship became an established thing in England. On the rebuilding of the cathedral after a fire, in 1175, a magnificent shrine was erected for him in a new chapel built for the purpose, which became thronged for three centuries by pilgrims and worshippers of all classes, from kings and emperors downwards. Henceforward the interests of the city became bound up in those of the cathedral, and were shown in the large number of hostels for the accommodation of the pilgrims, and of shops containing wares especially suited to their tastes. A pilgrimage to Canterbury became not only a pious exercise, but a fashionable summer excursion; and the poet Chaucer, writing in the 14th century, has given us an admirable picture of such pilgrimages, with the manners and behaviour of a party of pilgrims, leisurely enjoying the journey, and telling stories to each other on the road. Our very language still contains two words originating in these customs,—a "canterbury," or a "canterbury tale," a phrase used for a fiction,—and a "canter," which is a short form for a "canterbury gallop," an allusion to the easy pace at which these pilgrimages were performed. The largely ecclesiastical character of the city may still be seen in the numerous remains of buildings connected with the church with which its streets abound to the present day. The shrine with its vast collected wealth was destroyed, and every reminiscence connected with it as far as possible effaced, by King Henry VIII.'s commissioners in 1538.

In secular history Canterbury has been less remarkable. The castle was taken by Louis, son of Philip Augustus of France, during his incursion into England in 1215. Here, in the cathedral, Edward I. was married in 1299 to his second queen, Margaret of France, and Charles I. to Henrietta Maria in 1625. Hence started the Kentish rebels under Wat Tyler on their march to London in 1381, taking with them as prisoner Archbishop Sudbury, whom they beheaded later on Tower Hill,—in this point curiously repeating the action of the Danes during their invasion of 1011, who seized Archbishop Elphege from this cathedral, and shortly afterwards put him to death at Blackheath. The "Canterbury Christmas," that of 1647, is known for the resistance offered here to the attempt to carry out the decree of Parliament against the observance of the day. Out of the rising that ensued grew the "Kentish Petition" for the release of Charles I., supported, in the following summer, by an armed gathering of the gentry and yeomanry of the county, which was scattered by General Fairfax in the battle of Maidstone.

The cathedral stands on the site of a Roman church given by King Ethelbert, together with his own palace adjoining, to Augustine and his monks. This early church and its adjacent buildings were destroyed and entirely rebuilt by Archbishop Lanfranc in 1070, and the choir

was again rebuilt on a larger scale by his successor Archbishop Anselm, whose work, in turn, on being restored after the fire of 1172, was then considerably enlarged, especially by the addition of a chapel and corona, both dedicated to St Thomas, at its eastern end. In this state substantially the choir remains to the present day. Lanfranc's nave survived till the 14th century, when it was rebuilt, with the exception of one western tower, taken down in 1834. The central tower was not completed till about 1500. The most interesting parts remaining in the present church are—(1) the site of the murder of Becket in the north-west transept, which still shows the mark of the altar erected in its commemoration, though a prevalent story of a stone in the pavement from which his blood-stain has been cut out, is a modern fiction; (2) the site of the shrine itself, shown by the rough flooring in the centre of its chapel, King Henry's commissioners having destroyed the very pavement on which it stood; (3) a few remaining windows of rich 12th century glass, unique in England and scarcely equalled on the Continent; (4) monuments of the Black Prince, of Henry IV. and his queen, and of several of the archbishops from Peckham to Pole; (5) fine remains of Norman fresco-painting in the apse of St Gabriel in the crypt; and (6) the choir itself, built through the ten years succeeding 1174, an interesting specimen of the gradual transition from the Norman style progressing in England at the latter end of the 12th century, and showing especially the first introduction of that Southern-French variety of detail which gained a place in the new style now known as Early English. Many of the monastic buildings still remain, as the cloisters, the chapter-house, the treasury, the two entrance gateways, and the lavatory tower now used as a baptistery; and scattered in the precincts are relics of the infirmary, the dormitory, the prior's house, and three sets of buildings for hospitality to three different grades of pilgrims—all showing great beauty of architecture. The chapter buildings, added in the last few years, are not so praiseworthy.

Of St Augustine's Abbey the remains are fewer; but a beautiful gateway of the 14th century, the abbot's hall, and some remains of the great church, attest its former magnificence. Of the other religious foundations of the city, no remains exist of St Gregory's priory or St Sepulchre's nunnery, but interesting parts are left of the Grey or Franciscan Friars, the White or Augustinian, and the Black or Dominican Friars (the latter the first friary of this order established in England); also of the hospitals of St John, Northgate; St Nicholas, Harbledown; St Thomas, Eastbridge; St Lawrence; and that of the Poor Priests,—of which the first three still remain in use as almshouses. Of the fifteen parish churches which exist the most remarkable is St Martin's, the church frequented by Bertha the queen of Ethelbert before Augustine's arrival and thus the earliest seat of English Christianity. In this church Ethelbert must have been baptized, and the existing font has been supposed of that age; rude and archaic, however, as it is, it is not earlier than a Norman date, though Saxon masonry still exists in the church walls.

Among the secular remains there are large portions of the city walls, mostly of the 15th century, but connected in parts with an earthen bank of a very much earlier date, and in one spot with a conical mound called the Dane-John or Donjon, probably of Celtic origin. The Norman keep of the castle, one of Bishop Gundulph's works, still exists, but in a very mutilated condition, as well as a fine gateway tower, the west gate of the city, built about the year 1340 by Archbishop Sudbury. The Guild Hall is of old work, but has been refaced with modern brick; and part remains of the Chequers Inn for pilgrims, built by Prior Childeken about the year 1400, and mentioned by

Chaucer in his *Canterbury Tales*; but much of this was burnt down in 1865.

There are slight remains also of the archbishop's palace, built on the very ground originally given by King Ethelbert before his conversion, and then known as Staplegate; but the archbishops have ceased to reside in Canterbury since the 17th century.

The following is a list of archbishops of Canterbury to the present day:—

- | | |
|---|---|
| 1. Augustine, 597 to 605. | 54. John de Ufford, 1348 to 1349. |
| 2. Laurentius, 605 to 619. | 55. Thomas Bradwardin, 1349. |
| 3. Mellitus, 619 to 624. | 56. Simon Islip, 1349 to 1366. |
| 4. Justus, 624 to 630. | 57. Simon Langham, 1266 to 1368. |
| 5. Honorius, 631 to 653. | 58. William Wittlessey, 1368 to 1374. |
| 6. Deusdedit, 655 to 664. | 59. Simon Sudbury, 1375 to 1381. |
| 7. Theodore, 668 to 690. | 60. William Courtenay, 1381 to 1396. |
| 8. Berhtwald, 693 to 731. | 61. Thomas Arundel, 1396 to 1414. |
| 9. Tatwine, 731 to 734. | 62. Henry Chicheley, 1414 to 1443. |
| 10. Nothelm, 735 to 741. | 63. John Stafford, 1443 to 1452. |
| 11. Cuthbert, 741 to 758. | 64. John Kemp, 1452 to 1454. |
| 12. Breogwine, 759 to 762. | 65. Thomas Bourchier, 1454 to 1486. |
| 13. Janberht, 763 to 790. | 66. John Morton, 1486 to 1500. |
| 14. Æthelheard, 790 to 803. | 67. Henry Dene, 1501 to 1503. |
| 15. Wulfred, 803 to 829. | 68. William Warham, 1503 to 1532. |
| 16. Fleogild, 829 to 830. | 69. Thomas Cranmer, 1533 to 1550. |
| 17. Ceolnoth, 830 to 870. | 70. Reginald Pole, 1556 to 1558. |
| 18. Æthelred, 870 to 889. | 71. Matthew Parker, 1559 to 1575. |
| 19. Plegemund, 891 to 923. | 72. Edmund Grindal, 1575 to 1583. |
| 20. Æthelm, 923 to 925. | 73. John Whitgift, 1583 to 1604. |
| 21. Wulfelm, 925 to 941. | 74. Richard Bancroft, 1604 to 1610. |
| 22. Odo, 941 to 958. | 75. George Abbot, 1611 to 1633. |
| 23. Alsine, 953 to 959. | 76. William Laud, 1633 to 1645. |
| 24. Dunsian, 959 to 988. | 77. William Juxon, 1660 to 1663. |

CANTERBURY, a province of New Zealand, occupying the central portion of the Middle Island on the eastern side of the great dividing range of the Southern Alps. It is bounded on the E. by the sea, and on the N., W., and S. by the provinces of Nelson, Westland, and Otago respectively. The area of Canterbury is about 8,693,000 acres.

Physically, the province may be divided into two longitudinal sections, from north to south. Of these the more westerly, which is considerably the larger, is mountainous, sloping eastward into downs, while the other consists of a plain, covering an area of 2,500,000 acres. To these two main divisions must be added Banks Peninsula, an isolated hilly district on the eastern edge of the plain, jutting into the sea, and with an area of 250,000 acres. Thus the surface of the province is of the most diversified character, varying from the snow-clad peaks of the Southern Alps, which culminate in Mount Cook (13,200 feet), the highest mountain in New Zealand, to the dead level of the plain on which Christchurch stands, only a few feet above the sea. In lakes Canterbury gives place to Otago and Auckland, though Lakes Ohau and Coleridge are large sheets of water, situated amid scenery of the most beautiful description. The rivers of Canterbury are short and rapid, running with a direct course to the sea, and quite useless for purposes of navigation. Apart from the Hurunui and Waitangi, which divide Canterbury on the north-east and south-east from Nelson and Otago respectively, and hence belong equally to those provinces, the principal rivers of Canterbury are the Ashley, Waimakariri, Rakai, Ashburton, and Rangitata. They are all very liable to sudden and disastrous floods. The coast is poorly supplied with good harbours, that of Akaroa, in Banks Peninsula, being the only one safe in all kinds of weather. The harbour of Lyttelton is spacious, but exposed to easterly winds. The capital of Canterbury is Christchurch, and the other principal settlements are Lyttelton and Akaroa already mentioned, Kaiapoi a few miles north of Christchurch, and Timaru, 110 miles south of the latter place.

The downs and great plain of Canterbury are devoid of forests, but the mountain regions and Banks Peninsula yield abundance of excellent timber. The principal trees are the totara (*Podocarpus Totara*), rimu or red pine (*Dacrydium cupressinum*), and kahikatea or white pine (*Podocarpus dacryloides*). Coal well adapted for household and industrial purposes, though not of the first quality, is found in the Malvern Hills, to the west of Christchurch, and beds of clay ironstone exist in various localities, but are not yet worked. Gold is found in the south-western angle of the province, near the Otago border, though not in sufficient quantity to tempt many to search for it. The wealth of Canterbury consists in its flocks and its yield of agricultural produce. In 1874 the province contained 2,965,000 sheep and 79,000 cattle. The number of agricultural holdings was 3969, and the total area of land under crops of all kinds, including cultivated grass, was about 390,000 acres, of which 112,000 acres were under cereals. The imports of Canterbury in 1874 amounted to £1,568,826, and the exports to £1,108,531,—by far the greater proportion of the latter consisting of wool, wheat, and oats. The export of phormium fibre (New Zealand flax), from which much was at one time expected, has greatly declined, but on the other hand the export of preserved meats is rapidly rising in importance. The population of the province on 31st December 1874 was 71,316. Besides possessing many good roads, Canterbury is fast being opened up by railways. The first of these, from Lyttelton to Christchurch, a distance of eight miles, was tunnelled at great expense through the hills at the back of the former town. The line has since been continued on both sides of Christchurch—as far south as the River Rangitata, and as far north as the River Ashley, while branch lines have been, or are being, constructed to the settlements of Southbridge, Malvern, and Oxford. The first railway having been of the 5-foot 3-inch gauge, the main line is for the most part of that width, while the branches are of the narrow gauge of 3

feet 6 inches, which is almost universally adopted in other parts of the colony.

The educational system of Canterbury is comprehensive and efficient. In addition to the New Zealand University (an examining institution, supported by the colony as a whole, but having its headquarters at Christchurch), there are in the capital several educational institutions of high standing. Spread over the province there are also, in addition to schools maintained by private enterprise, many Government schools. The number of these on 31st March 1875 was 93. They were conducted by 288 teachers and attended by 12,000 scholars.

Canterbury was founded in December 1850 by an association headed by men of influential position in England, and connected with the national church. It was indeed sought for a time to prevent persons not members of the Church of England from settling in Canterbury, but the attempt was a failure. In 1867 the portion of the province west of the Southern Alps was formed into a separate province, under the name of Westland. Further particulars regarding the history of Canterbury will be found under the heading NEW ZEALAND.

CANTHARIDES, or SPANISH FLIES, are the common blister-beetles (*Cantharis vesicatoria* or *Lytta vesicatoria*) of European pharmacy. They are bright iridescent golden-green or bluish-coloured insects, with the breast finely punctured and pubescent, head and thorax with a longitudinal channel, and elytra with two slightly elevated lines. The insect is from half-an-inch to an inch in length, and from one to two lines broad, the female being broader in the abdomen and altogether larger than the male. It is a native of the South of Europe, being found in Spain, France, Germany, Italy, Hungary, and the South of Russia, and it is also obtained in Siberia. The Spanish fly is also occasionally found in the South of England. The insects feed upon ash, lilac, privet, and jasmine leaves, and are found more rarely on elder, rose, apple, and poplar trees. Their presence is made known by a powerful disagreeable odour, which penetrates to a considerable distance; and people sitting under trees on which the insects were feeding have been known to be injuriously affected by their presence. They are collected for use at late evening or early morning, while in a dull bedewed condition, by shaking them off the trees or shrubs into cloths spread on the ground; and they are killed by dipping them into hot water or vinegar, or by exposing them for some time over the vapour of vinegar. They are then dried and put up for preservation in glass-stoppered bottles; and they require to be very carefully guarded against mites and various other minute insects to the attacks of which they are peculiarly liable. Mr H. Poeklington has discovered by means of spectroscopic observations that the green colour of the elytra, &c., is due to the presence of chlorophyll; and he has demonstrated that the variations of the spectral bands are sufficient, after the lapse of many years, to indicate with some certainty the kind of leaves on which the insects were feeding shortly before they were killed. Cantharides owe their value to the presence of a peculiar chemical principle, to which the name cantharidin has been given. It is most abundant in large full-grown insects, while in very young specimens no cantharidin at all has been found. From about one-fourth to rather more than one-half per cent. of cantharidin has been obtained from different samples; and it has been ascertained that the hard parts of the insect contain about six times more of the active principle than the soft parts. Cantharidin crystallizes in colourless four-sided prisms; in solution or prepared with lard it produces very powerful vesication, and taken internally it is a violent irritant poison.

Spanish flies are most largely used as an external application, being but rarely taken internally. They are applied as a topical stimulant for indolent ulcers, as rubefacients, and especially for blistering in, inflammatory diseases. Taken internally in the form of tincture, they have been used in dropsy, in paralysis of the bladder, and for producing aphrodisiacal effects. They have also been employed in lepra and other skin diseases; and they have had a reputation in hydrophobia and other nervous disorders which they do not deserve.

A very large number of other insects belonging to the family *Cantharidae* possess blistering properties owing to their containing cantharidin. Of these the most remarkable is the Telini fly of India (*Myiabris cichorii*), the range of which extends from Italy and Greece through Egypt and Central Asia as far as China. It is very rich in cantharidin, yielding fully twice as much as ordinary cantharides. Several green-coloured beetles are, on account of their colour, used as adulterants to cantharides, but they are very easily detected by examination with the eye, or, if powdered, with the microscope.

CANTICLES. The book of Canticles, or the Song of Solomon, is called in Hebrew *The Song of Songs* (that is the *choicest of songs*), or, according to the full title which stands as the first verse of the book, *The choicest of the songs of Solomon*. In the Western versions the book holds the third place among the so-called Solomonic writings, following Proverbs and Ecclesiastes. In Hebrew Bibles it stands among the *Megillot*, the five books of the Hagiographa which have a prominent place in the Synagogue service. In printed Bibles and in German MSS. it is the first of these because it is read at the Passover, which is the first great feast of the sacred year of the Jews. Spanish MSS., however, place it second among the *Megillot*, giving the precedence to Ruth.

No part of the Bible has called forth a greater diversity of opinions than the Song of Solomon, and that for two reasons. In the first place, the book holds so unique a position in the Old Testament, that the general analogy of Hebrew literature is a very inadequate key to the verbal difficulties, the artistic structure, and the general conception and purpose of the poem. In point of language it is most nearly akin to parts of the Bible which, like the song of Deborah, belong to Northern Israel, agreeing with these not only in individual traits but in the general characteristic that the departures from ordinary Hebrew are almost always in the direction of Aramaic. Many forms unique in Biblical Hebrew are at once explained by the Aramaic dialects, but not a few are still obscure. The philological difficulties of the book are, however, less fundamental than those which lie in the unique character of the Song of Solomon in point of artistic form, and in the whole atmosphere of thought and feeling in which it moves. Even in these respects it is not absolutely isolated. Parallels to the peculiar imagery may be found in the book of Hosea, in a few passages of the earlier chapters of Proverbs, and above all in the 45th Psalm; but such links of union to the general mass of the Old Testament literature are too slight to be of material assistance in the solution of the literary problem of the book. Here, again, as in the lexical difficulties already referred to, we are tempted or compelled to argue from the distant and insecure analogy of other Eastern literatures, or are thrown back upon traditions of uncertain origin and ambiguous authority.

The power of tradition has been the second great source of confusion of opinion about the Song of Solomon. To tradition we owe the title, which apparently indicates Solomon as the author and not merely as the subject of the book. The authority of titles in the Old Testament

(see BIBLE) is often questionable, and in the present case it is certain on linguistic grounds that the title is not from the hand that wrote the poem; while to admit that it gives a correct account of the authorship is to cut away at one stroke all the most certain threads of connection between the book and our historical knowledge of the Old Testament people and literature. We have already noted that, when judged by comparison with other parts of the Bible and by its Aramaic texture, the dialect points to a northern origin of the poem. It is to Northern Israel, moreover, that the whole local colouring and scenery belong; so that even those commentators who still make Solomon the hero and author of the book are compelled to represent him as laying aside his kingly pomp to wander with a peasant girl through the gardens and forests of Galilee. The untenableness of this last attempt to rescue the authority of the title will appear as we proceed.

To tradition, again, we owe the still powerful prejudice in favour of an allegorical interpretation, that is, of the view that from verse to verse the Song sets forth the history of a spiritual and not merely of an earthly love. To apply such an exegesis to Canticles is to violate one of the first principles of reasonable interpretation. True allegories are never without internal marks of their allegorical design. The language of symbol is not so perfect that a long chain of spiritual ideas can be developed without the use of a single spiritual word or phrase; and even were this possible it would be false art in the allegorist to hide away his sacred thoughts behind a screen of sensuous and erotic imagery, so complete and beautiful in itself as to give no suggestion that it is only the vehicle of a deeper sense. Apart from tradition no one, in the present state of exegesis, would dream of allegorizing poetry which in its natural sense is so full of purpose and meaning, so apt in sentiment, and so perfect in imagery as the lyrics of Canticles. We are not at liberty to seek for allegory except where the natural sense is incomplete. This is not the case in the Song of Solomon. On the contrary, every form of the allegorical interpretation which has been devised carries its own condemnation in the fact that it takes away from the artistic unity of the poem and breaks natural sequences of thought.¹ The allegorical interpretation of the Song of Solomon, had its rise in the very same conditions which forced a deeper sense, now universally discarded, upon so many other parts of scripture. Yet strangely enough there is no evidence that the Jews of Alexandria extended to the book their favourite methods of interpretation. The arguments which have been adduced to prove that the LXX. translation implies an allegorical exegesis are inadequate; and Philo does not mention the book at all. Nor is there any allusion to Canticles in the New Testament. The first trace of an allegorical view identifying Israel with the spouse appears to be in the Fourth Book of Ezra, near the close of the 1st Christian century (v. 24, 26; vii. 26). Up to this time the canonicity of the Canticles was not unquestioned; and the final decision as to the sanctity of the book, so energetically carried through by R. Akiba, when he declared that "the whole world is not worth the day on which the Song of Songs was given to Israel; for all the scriptures (or Hagiographa) are holy, but the Canticles most holy," must be understood as being at the same time a victory of the allegorical interpretation over the

¹ An argument for the allegorical interpretation has been often drawn from Mahometan mysticism,—from the poems of Hafiz, and the songs still sung by dervishes. See Jones, *Poëses Asiaticæ Com.*, pt. iii. cap. 9; Rosenmüller's remarks on Lowth's *Prælectio xxxi.*, and Lane's *Modern Egyptians*, ch. xxiv. But there is no true analogy between the Old Testament and the pantheistic mysticism of Islam, and there is every reason to believe that, where the allegory takes a form really analogous to Canticles, the original sense of these songs was purely erotic.

last remains of a view which regarded the poem as simply erotic.¹

The form in which the allegorical theory became fixed in the synagogue is contained in the Midrash *Chazita* and in the Targum, which is a commentary rather than a translation. The spouse is Israel, her royal lover the divine king, and the poem is explained as tracing the great events of the people's history from the Exodus to the Messianic glory and final restoration.²

The authority of Origen, who, according to Jerome, surpassed himself in his commentary of ten volumes on this book, established the allegorical theory in the Christian church in the two main forms in which it has since prevailed. The bridegroom is Christ, the bride either the church or the believing soul. The latter conception is, of course, that which lends itself most readily to purposes of mystical edification, and which has made Canticus the manual in all ages of a wide-spread type of religious contemplation. But the other view, which identifies the bride with the church, must be regarded as the standard of orthodox exegesis. Of course the allegorical principle admitted of very various modifications, and readily adapted itself to new religious developments, such as the rise of Mariolatry. Within the limits of the orthodox traditions the allegory took various colours, according as its mystical or its prophetic aspect was insisted on. Among mediæval commentators of the former class St. Bernard holds a pre-eminent place; while the second class is represented by Nicholas de Lyra who, himself a converted Jew, modified the Jewish interpretation so as to find in the book an account of the *processus ecclesie* under the Old and New Testaments. The prophetic exegesis reached its culminating point in the post-Reformation period, when Cocceius found in the Canticus a complete compendium of church history. But the relaxation of traditional authority opened the door to still stranger vagaries of interpretation. Luther was tempted to understand the book of the political relations of Solomon and his people. Others detected the loves of Solomon and Wisdom—a view which found a supporter in Rosenmüller even in the present century; alchemists thought of Solomon's researches in their art; and Puffendorf, by the aid of Egyptian hieroglyphics, referred the whole to the grave of Christ.

The history of the literal interpretation begins with the great "commentator" of the Syrian Church, Theodorus of Mopsestia (died 429), who condemned equally the attempt to find in the book a prophecy of the blessings given to the church, and the idea even at that time expressed in some quarters that the book is immoral. Theodorus regarded the Canticus as a poem written by Solomon in answer to the complaints of his people about his Egyptian marriage; and this was one of the heresies charged upon him after his death, which led to his condemnation at the second council of Constantinople (553 A.D.). A literal interpretation was not again attempted till in 1544 Chateillon (Castellio or Castellon) lost his regency at Geneva for proposing to expel the book from the canon as impure. Grotius (*Annot. in V. II.*, 1644) took up a more moderate position. Without denying the possibility of a secondary reference designed by Solomon to give his poem a more permanent value, he regards the Canticus as primarily an *epithalamium* (conjugal

prattle) between Solomon and Pharaoh's daughter. The distinction of a primary and secondary sense gradually became current not only among the Remonstrants, but in England (Lightfoot, Lowth) and even in Catholic circles (Bossuet, 1693). In the actual understanding of the book in its literal sense no great progress was made. Solomon was still viewed as the author, and for the most part the idea that the poem is a dramatic epithalamium was borrowed from Origen and the allegorists, and applied to the marriage of Pharaoh's daughter. To reconcile this idea with the fact that the Song is full of peasant life, a most artificial style of composition had to be assumed. In Bossuet's once celebrated theory, to which Lowth also inclined, the epithalamium is made to extend over seven days, and each morning the bridegroom, who is fictitiously represented as a shepherd, rises early to pursue his rustic toil, leaving his bride alone till the evening. The seventh day is the Sabbath, when the bride and bridegroom appear together (ch. viii.). From Grotius to Lowth the idea of a typical reference designed by Solomon himself appears as a mere exorcism on the natural interpretation, but as an exorcism which could not be removed without perilling the place of Canticus in the canon, which, indeed, was again assailed by Whiston in 1723. But in his notes on Lowth's lectures, J. D. Michaelis, who regarded the poem as a description of the enduring happiness of true wedded love long after marriage, proposed to drop the allegory altogether, and to rest the canonicity of the book, as of other parts of Proverbs which treat of conjugal affection, on the moral picture it presents (1753). The hint which Michaelis offered for the interpretation of the book on this principle showed a singular want of delicacy; but the moralizing rationalism of the period was not to be shocked by any impropriety which was atoned for by the "important moral tendency" of the book as a whole; and the principle laid down by the critic of Göttingen was carried out in a variety of hypotheses, each, as Herder complained, more improper than the other. A real step, however, was made in 1771 by J. T. Jacobi, who distinguished the husband of the Shulamite from Solomon, and representing the latter as a baffled tempter, prepared the way for the theory now most current among critics.

Then came Herder's exquisite little treatise on *Solomon's Songs of Love, the Oldest and Sweetest of the East* (1774). Herder possessed that delicacy of taste and sympathetic poetical genius which the school of Michaelis altogether lacked. Delighting in the Canticus as the transparently natural expression of innocent and tender love, he was indignant at an exegesis which, in a supposed apologetical interest, was content to establish a didactic object for the book by the aid of hypotheses which sullied the purity and profaned the sanctity of the utterances of genuine human affection. If the songs of Canticus were allowed to speak for themselves, they would need no theory to explain their meaning, no apology to justify their morality, no fiction of a typical or didactic purpose to commend them as pure, lovely, and worthy of a place in a holy book. Is not true love itself holy? for love is the fountain of all man's bliss, and all love, like goodness and truth, is at root one. Herder justifies these views in a sort of æsthetic commentary, which triumphantly vindicates the naive innocence and genuine delicacy of the love which the book displays. But his sympathy with the sentiment of the Canticus was truer than his eye for details; and the idea that the poem is simply a sequence of independent songs without inner unity, grouped so as to display various phases and stages of love in a natural order, culminating in the placid joys of wedded life, was in some respects a retrograde step.

Since Herder there has been no attempt of any intrinsic

¹ The chief passages of Jewish writing, referring to this dispute are Mishna *Sabbath* iii. 5 and Talmud *Berachot* xii. For other passages see Grotius's *Commentary*, p. 115, and in control of his criticism the introduction to the commentary of Dehmel.

² The text of the Targum in the Polyglot and in Buxton's *Rabbinic Bible* is not complete. The complete text is given in the Venice edition, and in Jengelski's *Manuscripta Chaldaica*, Lipsia, 1873. The Polyglot adds a Latin version.

value to rehabilitate the allegorical theory, or the theory of a second sense consciously followed by the author. Even those commentators who, like Delitzsch (1851 and 1875) or his followers Zöckler (1868) and Kingsbury (in the *Speaker's Commentary*, 1873), assume that Canticles owes its place in the canon to the typical importance of Solomon in the history of salvation do not venture to make this idea an element in the exegesis.

In determining the literal sense recent scholars have followed three main courses. The theory of Herder, which refuses to acknowledge any continuity in the book, was accepted by Eichhorn on the part of scholars, and with some hesitation by Goethe on the part of the poets. Commentaries based on this view are those of Döpfke (1829), Magnus (1842), Noyes (1846); and it has also enjoyed the critical authority of De Wette and Diestel. A second view which is at present dominant recognizes in the poem a more or less pronounced dramatic character, and following Jacobi distinguishes the shepherd, the true love of the Shulamite, from King Solomon, who is made to play an ignominious part. Propounded in last century by Stäudlin (1792) and Ammon (1795), this view was energetically carried out by Umbreit (1820), and above all by Ewald, whose sentences gave the theory a new development, while his commanding influence among Hebrew scholars acquired for it general recognition. Ewald assumed a very simple dramatic structure, and did not in his first publication (1826) venture to suppose that the poem had ever been acted on a stage. His less cautious followers have been generally tempted to dispose of difficulties by introducing more complicated action and additional interlocutors (so, for example, Hitzig, 1855; Ginsburg, 1857; Renan, 1860); while EBCrcher (1850) did his best to reduce the dramatic exposition to absurdity by introducing the complexities and stage effects of a modern operetta into a drama of the 10th century before Christ. The third view is that of Delitzsch and his followers, who also plead for a dramatic form—though without supposing that the piece was ever acted—but adhere to the traditional notion that Solomon is the author, who celebrates his love to a peasant maiden whom he made his wife, and in whose company the proud monarch learned to appreciate the sweetness of a true affection and a simple rustic life.

In comparing these various views with what is found in the book itself, the unity of the poem has first to be considered. A certain external unity, not merely in the general tone and colour of the language and in the repetition of similar sentences by way of refrain, but also in the order of the matter, is not denied by the followers of Herder, who, however, maintain that the constituent lyrics were originally distinct poems, and that they owe all appearance of continuity to the arrangement and interpolations of an editor. The correctness of this view would be positively demonstrated if its adherents were able, without arbitrary treatment of the text, to digest the Canticles into a series of lyrics, each complete in itself and independent of the rest. But no commentator has hitherto done this in a satisfactory way, and the most ingenious attempts—especially that of Magnus—involve the assumption that the editor often displaced part of a song, sacrificing the unity of the original lyrics to an artificial composition of the whole. It is plain that, if assumptions of this kind are to be made at all, they may also be used in favour of a theory of original unity, marred by subsequent misconception.

Have, then, the supporters of the continuity of the poem come nearer to a positive proof of their position? Our starting-point, in looking at this question, is the fact that the composition takes for the most part the form of dialogue. Even if the book is to be broken up into distinct lyrics, it must be granted that several of these pieces

have an amœbean structure. Is it possible to show that throughout the book the same persons reappear in these lyrical dialogues? And, again, since the scene of the dialogue certainly varies in different parts of the book between the city of Jerusalem and the open country of Northern Israel, is it possible to find in the poem itself a thread of narrative sufficient to account for the change of place? The centre of attraction is throughout a female figure, and the unity of this figure is the chief test of the unity of the book. In the long canto, I. 1-ii. 7, the heroine appears in a royal palace (i. 4) among the daughters of Jerusalem, who are thus presumably ladies of the court of Zion. At i. 9, an additional interlocutor is introduced, who is plainly a king, and apparently Solomon (i. 9, 12). He has just risen from table, and praises the charms of the heroine with the air of a judge of beauty, but without warmth. He addresses her simply as "my friend" (not as English version, "my love"). The heroine on the contrary is passionately in love, but nothing can be plainer than that the object of her affection is not the king. She is not at home in the palace, for she explains (i. 6) that she has spent her life as a peasant girl in the care of vineyards. Her beloved, whom she knows not where to find (i. 7), but who lies constantly on her heart and is cherished in her bosom like a spray of the sweet henna flowers which Oriental ladies delight to wear (i. 13, 14), is like herself a peasant—a shepherd lad (i. 7)—with whom she was wont to sit in the fresh greenwood under the mighty boughs of the cedars (i. 16, 17). Even before the king's entrance the ladies of the court are impatient at so silly an affection, and advise her, "if she is really so witless," to begone and rejoin her plebeian lover (i. 8). The idea that from i. 12 onwards the heroine exchanges compliments with the king is inconsistent with what precedes, and psychologically impossible in view of ii. 5, 6, where her self-control, strung to the highest pitch as she meets the compliments of the king with reminiscences of her absent lover, breaks down in a fit of half delirious sickness. The only words directed to the king are those of i. 12, which, if past tenses are substituted for the presents of the English version, contain a pointed rebuff. Finally, ii. 7 is, on the plainest translation, a charge not to arouse love till it please. The moral of the scene is the spontaneity of true affection.¹

Nothing can be plainer than that the motive of this piece is dramatical and not lyrical. It is a complete scene, but not a complete poem, and if it is not a fragment, we must expect to find the denouement at the close of the book. Now, at viii. 5, a female figure advances leaning upon her beloved, with whom she claims inseparable union,—"for love is strong as death, its passion inexorable as the grave, its fire a divine flame which no waters can quench or floods drown. Yea, if a man would give all his wealth for love he would only be condemned." This is obviously the sentiment of ii. 7, and the suitor, whose wealth is despised, must almost of necessity be identified with the king of chapter I, if, as seems reasonable, we place viii. 11, 12 in the mouth of the same speaker—"King Solomon has vineyards which bring him a princely revenue, and enrich even the farmers. Let him and them keep their wealth; my vineyard is before me" (i.e., I possess it in present fruition). The last expression is plainly to be connected with i. 6. But this happiness has not been reached without a struggle. The speaker has proved herself an

¹ In comparing these remarks with the text, the English reader must remember that the authorized version is influenced in its readings by a theory of the book. The translation of ii. 7 is quite false. The second half of i. 13 is simply "which rests upon my heart;" i. 4 should probably run, "Draw me after thee, let us sleep;" i. 9 "to my home."

impregnable fortress (ver. 10), and, armed only with her own beauty and innocence, has been in his eyes as one that found peace. The English version is quite arbitrary in rendering *favour* for *peace*. The sense is that, like a virgin fortress, she has compelled her assailant to leave her in peace. To these marks of identity with the heroine of ch. i. are to be added that she appears here as dwelling in gardens, there as a keeper of vineyards (i. 6, and viii. 13), and that as there it was her brethren that prescribed her duties, so here she apparently quotes words in which her brothers, while she was still a child, speculated as to her future conduct and its reward (viii. 8, 9).

If this analysis of the commencement and close of the book is correct, it is certain that the poem is in a sense dramatic, that is, that it uses dialogue and monologue to develop a story. The heroine appears in the opening scene in a difficult and painful situation, from which in the last chapter she is happily extricated. But the dramatic progress which the poem exhibits scarcely involves a plot in the usual sense of that word. The words of viii. 9, 10 clearly indicate that the deliverance of the heroine is due to no combination of favouring circumstances, but to her own inflexible fidelity and virtue. In accordance with this her *role* throughout the poem is simply a steadfast adherence to the position which she takes up in the opening scene, where she is represented as concentrating her thoughts on her absent lover with all that stubborn force of will which is characteristic of the Hebrews, and as frustrating the advances of the king by the mere naive intensity of pre-occupied affection. This conception of the principal part in the poem implies a very elementary amount of dramatic skill. But it is just the conception which the analogy of Hebrew poetry in general, and especially of the book of Job, leads us to expect. The characters of Job and his friends are carefully discriminated. But there is no action and reaction between the speakers. Each adheres to his own vein of thought almost untouched by what the others say, and the skill of the author appears only in the variety of poetical developments in which the fundamental idea of each character expresses itself. The reader who, with this analogy to guide him, runs through the parts of Canticles which must be assigned to a female speaker, cannot fail to see that the *role* indicated at the beginning and close of the book is carried out with perfect consistency.

The constant direction of the maiden's mind to her true love is partly expressed in dialogue with the ladies of the court (the daughters of Jerusalem), who have no dramatic individuality, and whose only function in the economy of the piece is to give the heroine opportunity for a more varied expression of her feelings. In i. 8 we found them contemptuous. In chapter iii. they appear to be still indifferent; for when the heroine relates a dream in which the dull pain of separation and the uneasy consciousness of confinement and danger in the unsympathetic city disappear for a moment in imagined reunion with her lover, they are either altogether silent or reply only by taking up a festal part song describing the marriage procession of King Solomon (iii. 6-11), which stands in jarring contrast to the feelings of the maiden.¹ A second dream (v. 2-8), more weird and melancholy, and constructed with that singular psychological felicity which characterizes the dreams of the Old Testament, gains more sympathy, and the heroine is encouraged to describe her beloved at large (v. 10-vi. 3). The structure of these

dialogues is so simple, and their purpose is so strictly limited to the exhibition of the character and affection of the maiden, that it is only natural to find them supplemented by a free use of pure monologue, in which the heroine recalls the happiness of past days, or expresses her rising hope of reunion with her shepherd, and restoration to the simple joys of her rustic life. The vivid reminiscence of ii. 8-17 takes the form of a dialogue within the main dialogue of the poem, a picture within a picture—the picture of her beloved as he stood at her window in the early spring time, and of her own merry heart as she laughingly answered him in the song with which watchers of the vineyards frighten away the foxes. It is, of course, a fault of perspective that this reminiscence is as sharp in outline and as strong in colour as the main action. But no one can expect perspective in such early art, and recollection of the past is clearly enough separated from present reality by ii. 16, 17.² The last monologue (vii. 10-viii. 3), in which the hope of immediate return with her lover is tempered by maidenly shame, and a maiden's desire for her mother's counsel, is of special value for a right appreciation of the psychology of the love which the poem celebrates, and completes a picture of this flower of the northern valleys,³ which is not only firm in outline but delicate in touch. The subordinate action, which supports the portraiture of the maiden of Galilee is by no means easy to understand. It may be regarded as certain that, in iv. 1-7, the king is again introduced, and describes the personal charms of the heroine. His language is still that of cold admiration, suitable enough to the character of Solomon, and strongly contrasted with the beautiful and passionate outburst which follows (iv. 8-v. 1), and which suits no lips but those of the true lover. The latter passage offers great difficulties on any theory which finds a strict drama in Canticles. To suppose that the shepherd appears in Jerusalem at so early a point in the action is not plausible, and it seems equally violent to assume with Ewald that the whole passage is to be put in the mouth of the heroine rehearsing words of her beloved. Perhaps the plan of the poem did not forbid the author to place a song of the absent shepherd in juxtaposition with the words of Solomon so as to bring out the contrast between mere sensual admiration and genuine passion. But the passage presents on any theory difficulties of detail which no critic has satisfactorily removed.

We come next to chapter vi., which again sings the praises of the heroine, and takes occasion in this connection to introduce, with the same want of perspective as we observed in ch. ii., a dialogue descriptive of Solomon's first meeting with the maiden. We learn that she was an inhabitant of Shulem or Shunem in Issachar, whom the king and his train surprised in a garden on the occasion of a royal progress through the north. Her beauty drew from the ladies of the court a cry of admiration. The maiden shrinks back with the reply—"I was gone down into my garden to see its growth. . . . I know not how my soul hath brought me among the chariots of princes;" but she is commanded to turn and let her be seen in spite of her bashful protest,—"Why do ye gaze on the Shulamite as at a dance of Mahanaim (a spectacle)."⁴ Now the person in whose mouth this relation is placed must be an eye-witness of the scene, and so none other than the king. But in spite of the verbal repetition of several of the figures of ch. iv., which,

¹ Ewald and others make this song a distinct scene in the action of the poem, supposing that the author here exhibits the honourable form of espousal by which Solomon thought to vanquish the scruples of the damsel. This view, however, seems to introduce a complication foreign to the plan of the book.

² "My beloved is mine, and I am his, who feedeth his flock among lilies. Before the day cool and the shadows fly, haste thee hither, my love, . . . over the mountains of separation."

³ The rose (marcassin) of Sharon (ii. 1) must be placed in the northern Sharon between Tabor and the Lake of Tiberias.—*Onom. Sacra*, ed. Lagarde, pp. 151, 296.

⁴ The purport of these verses was divined by Ewald.

CANTON, or more correctly KWANG-CHOW Foo, is a large and populous commercial city of China, in the province of Kwang-tung, situated on the eastern bank of the Pearl River, which at Canton is somewhat broader than the Thames at London Bridge, and is navigable 300 miles farther into the interior. The Pearl River has an additional course of 80 miles to the sea, the first part of which lies through a rich alluvial plain. Beyond this rises a range of hills terminating in abrupt escarpments along the course of the river. The bold shore thus formed compresses the stream at this point into a narrow pass, to which the Chinese have given the name of Hu-mun, or Tiger's mouth. This the Portuguese translated into Boea Tigre, whence the designation of "the Boque," by which it is commonly known among Europeans. When viewed from the hills on the north, Canton appears to be little

more than an expanse of reddish roofs relieved by a few large trees,—two pagodas shooting up within the walls, and a five-storied tower near the northern gate, being the most conspicuous objects. These hills rise 1200 feet above the river. Little or no vegetation is seen on them; and their acclivities, covered for miles with graves and tombs, serve as the necropolis of this vast city. Three or four forts are built on the points nearest the northern walls. Facing the city on the opposite side of the river is the suburb and island of Honan. The part of Canton enclosed by walls is about six miles in circumference, and has a partition wall, running east and west, and dividing the city into two unequal parts. The northern and larger division is called the old, and the southern the new city. Including the suburbs, the city has a circuit of nearly ten miles. The houses stretch along the river for four miles, and the banks are almost entirely concealed by boats and rafts. The walls of the city are of brick, on a foundation of sandstone and granite, are 20 feet thick, and rise to an average height of 25 feet. On the north side the wall rises to include a hill which it there meets with, and on the other three sides the city is surrounded by a ditch, which is filled by the rising tide, when, for a time, the revolting mass of filth that lies in its bed is concealed from view. There are twelve outer gates—four of which are in the partition wall, and two water

gates, through which boats pass from east to west across the new city. The gates are all shut at night, and in the day time a guard is stationed at them to preserve order. The streets, amounting in all to upwards of 600, are long, straight, and very narrow. They are mostly paved and are not as dirty as those of some of the other cities in the empire; in fact, considering the habits of the people and the inattention of Government to these matters, Canton may be said to be a well-governed and comparatively cleanly city. The houses are in general small, seldom consisting of more than two stories, the ground floor serving as a shop in which goods are exhibited for sale, and the rest of the house, with the court behind, being used as a warehouse. Here are to be found the productions of every quarter of the globe; and the merchants are in general extremely attentive and civil. The Chinese are remarkably expert men of business, and are generally of the most assiduous habits.

The temples and public buildings of Canton are numerous, but none of them present features worthy of special remark. There are two pagodas near the west gate of the old city, and 124 temples, pavilions, halls, and other religious edifices within the city. One of the pagodas called the *Kwangtak*, or Plain Pagoda, is a Mahometan mosque, which was erected by the Arabian voyagers who were in the habit of visiting Canton about ten centuries ago. It rises in an angular tapering tower to the height of 160 feet. The other is an octagonal pagoda of nine stories, 170 feet in height, and was first erected more than thirteen centuries ago. A Buddhist temple at Honan, opposite the foreign factories, and named in Chinese *Hai-chwang-sze*, or the Temple of the Ocean Banner, is one of the largest in Canton. Its grounds, which cover about seven acres, are surrounded by a wall, and are divided into courts, gardens, and a burial-ground, where are deposited the ashes of priests, whose bodies are burned. There are about 175 priests connected with this establishment. Besides the *Hai-chwang-sze* the most noteworthy temples in and about the city are those of the Five Hundred Gods, and of Longevity, both in the western suburbs; the Tartar City Temple, and the Temple of the Five Genii. The number of priests and nuns in Canton is not exactly known, but they probably exceed 2000, nine-tenths of whom are Buddhists. The temples are gloomy-looking edifices. The areas in front of them are usually occupied by hucksters, beggars, and idlers, who are occasionally driven off to make room for the match-sheds, in which the theatrical performances got up by the wealthy inhabitants are acted. The principal hall, where the idol sits enshrined, is lighted only in front, and the inner apartments are inhabited by a class of men almost as senseless as the idols they serve.

The residences of the high officers of government are all within the walls of the old city. The residence of the governor-general used to be in the south-west corner of the new city, but it was utterly destroyed by the bombardment in 1856. The site remained desolate until 1860, when it was taken possession of by the French authorities, who have erected a Roman Catholic Cathedral upon it. The residence of the commander-in-chief is in the old city, and is said to be one of the best houses in Canton. There are four prisons in the city, all large edifices. For the space of four or five miles opposite Canton boats and vessels are ranged parallel to each other in such close order that it resembles a floating city; and these marine dwellings are occupied by numerous families, who reside almost constantly on the water. In the middle of the river lie the Chinese junks, some of them of from 600 to 1000 tons burden, which trade to the north and to the Strait Settlements. The various guilds and associations among the people and

the merchants from other provinces have public halls each for its own particular use. The number of these buildings is not less than 150. Canton was long the only seat of British trade with China, and was no doubt fixed upon by the Chinese Government for the European trade, as being the most distant from the capital Peking.

Formerly only a limited number of merchants, called the *hong* or security merchants, were allowed to trade with foreigners. They were commonly men of large property, and were famed for integrity in their transactions. All foreign cargoes passed through the hands of these merchants, and by them also the return cargoes were furnished. They became security for the payment of customs duties, and it was criminal for any other merchant to engage in the trade with foreigners.

Accounts are kept at Canton, in common with the rest of China, in *taels*, *mace*, *candarines*, and *cash*,—ten cash being one candarine, ten candarines one mace, ten mace one tael, which last is converted into English money at about 6s. 8d. The coin called cash is of base metal, cast, not coined, and very brittle. It is of small value, and varies in the market from 750 to 1000 cash for a tael. Its chief use is in making small payments among the lower classes. Spanish and other silver coins are current, and are estimated by their weight,—every merchant carrying scales and weights with him. All the dollars that pass through the hands of the *hong* merchants bear their stamp; and when they lose their weight in the course of circulation they are cut in pieces for small change. The duties are paid to Government in sycee, or pure silver, which is taken by weight. In delivering a cargo, English weights and scales are used, which are afterwards reduced to Chinese catties and peculs. A pecul weighs 133½ lb vroidupois, and a catty 1½ lb. Gold and silver are also weighed by the tael and catty, 100 taels being reckoned equal to 120 oz. 16 dwt. troy.

The foreign trade at Canton was materially damaged by the opening of Shanghai and the ports on the Yangtze, but it is yet of very considerable importance, as the subjoined table of the total value of the foreign trade with Canton between the years 1861 and 1874 inclusive is sufficient to show:—

Year.	Total Value of Imports.	Total Value of Exports.	Total Value.
	Dollars.	Dollars.	Dollars.
1861	12,977,353	15,811,512	28,788,865
1862	10,580,928	17,742,590	28,323,518
1863	9,505,285	16,083,062	25,588,347
1864	8,192,795	13,659,177	21,851,972
1865	10,556,602	18,054,557	28,611,159
1866	14,171,101	18,832,622	33,003,723
1867	14,090,581	18,403,154	32,493,735
1868	12,991,266	18,491,156	31,482,422
1869	11,467,679	20,010,626	31,498,305
1870	12,053,394	19,857,543	31,910,937
1871	15,661,889	23,612,439	39,274,328
1872	16,802,553	25,691,712	42,494,265
	Shanghai Taels.	Shanghai Taels.	Shanghai Taels.
1873	9,843,819	16,156,437	26,000,256
1874	9,499,447	16,640,525	26,139,972

Although it is in the same parallel of latitude as Calcutta, the climate of Canton is much cooler, and is considered superior to that of most places situated between the tropics. The extreme range of the thermometer is from 38° to 100° Fahr., though these extremes are rarely reached. In ordinary years the winter minimum is about 42°, and the maximum in summer 96°. From May to October the hot season is considered to last; during the rest of the year the weather is cool. In shallow vessels ice sometimes forms at Canton; and so rarely is snow seen

that when in February 1835 a fall to the depth of two inches occurred, the citizens hardly knew its proper name. Most of the rain falls during May and June, but the amount is, nothing in comparison with that which falls during a rainy season in Calcutta. July, August, and September are the regular monsoon months, the wind coming from the south-west with frequent showers, which allay the heat. In the succeeding months the northerly winds commence, with some interruptions at first, but from October to January the temperature is agreeable, the sky clear, and the air invigorating. Few large cities are more generally healthy than Canton, and epidemics rarely prevail there.

Provisions and refreshments of all sorts are abundant, and in general are excellent in quality and moderate in price. It is a singular fact, that the Chinese make no use of milk, either in its natural state, or in the form of butter or cheese. Among the delicacies of a Chinese market are to be seen horse-flesh, dogs, cats, hawks, owls, and edible birds'-nests. The business between foreigners and natives at Canton is generally transacted in a jargon known as "Pigeon English," the Chinese being extremely ready in acquiring a sufficient smattering of English words to render themselves intelligible.

The intercourse between China and Europe by the way of the Cape of Good Hope began in 1517, when Emmanuel, king of Portugal, sent an ambassador, accompanied by a fleet of eight ships, to Peking, on which occasion the sanction of the emperor to establish a trade at Canton was obtained. It was in 1596, in the reign of Queen Elizabeth, that the English first attempted to open an intercourse with China, but ineffectually, for the two ships which were despatched on this mission were lost in the outward voyage, and it was not till about 1634 that English ships visited Canton. Unfortunately at this time a misunderstanding having occurred with the Chinese authorities owing to the treachery of the Portuguese, a rupture and a battle took place, and it was with difficulty that peace was again restored. In 1673 China was again visited by an English ship which was subsequently refused admission into Japan, and in 1677 a factory was established at Amoy. But during an irruption of the Tatars three years later this building was destroyed, and it was not till 1685 that the emperor permitted any trade with Europeans at that port. Upon the union of the two East India Companies in London, an imperial edict was issued, restricting the foreign commerce to the port of Canton.

Tea was first imported in England about the year 1667, and in 1689 a customs duty of 5s. per lb was for the first time imposed. From this date to 1834 the East India Company held a monopoly of the trade at Canton, and during this period the prosperity of the port increased and multiplied, notwithstanding the obstructions which were constantly thrown in the way of the "Barbarians" by the Chinese Government. The termination of the Company's monopoly brought no alteration in the conduct of the native authorities, whose oppressions became before long so unbearable that in 1839 war was declared on the part of Great Britain. In 1841, while the forces under Sir Hugh (afterwards Lord) Gough were preparing to capture Canton, Capt. Elliott entered into negotiations with the Chinese, and consented to receive a pecuniary ransom in lieu of occupying the city. Meanwhile the war was carried on in central China, and finally resulted in the conclusion of the Nanking Treaty in August 1842, under the terms of which four additional ports, viz., Shanghai, Ningpo, Fuh-chow Foo, and Amoy, were thrown open to foreign trade, and foreigners were granted permission to enter the city of Canton, from which they had hitherto been excluded. This latter provision of the treaty, however, the Chinese refused to carry out; and after endless disputes about this and

other improper acts of the Chinese Government, war was again declared in 1856, the immediate cause of which was an insult offered to the British flag by the capture of certain Chinese on board the "Arrow," a small craft trading under English colours. The outbreak of hostilities was followed by the pillage and destruction of the foreign "factories," in December 1856, by a Chinese mob, and twelve months later Canton was taken by assault by a force under Sir Charles Staunton, which had been sent out from England for the purpose. From this time until October 1861, the city was occupied by an English and French garrison, and the administration of affairs was entrusted to an allied commission, consisting of two English officers and one French officer, acting under the English general. Since the withdrawal of this garrison, the city of Canton has been freely open to foreigners of all nationalities, and the English consul at the present time has his residence in the Yamun formerly occupied by the allied commissioners, within the city walls.

On the conclusion of peace it became necessary to provide a foreign settlement for the merchants whose "factories" had been destroyed, and after some consultation it was determined to fill in and appropriate as the British settlement an extensive mud flat lying to the westward of the old factory site, and known as Sha-mien, or "The Sand Flats." This site having been leased, it was converted into an artificial island by building a massive embankment of granite in an irregular oval form. Between the northern face of the site and the Chinese suburb, a canal of 100 feet in width was constructed, thus forming an island of about 2850 feet in length and 950 feet in greatest breadth. The expense of making this settlement was 325,000 Mexican dollars, four-fifths of which were defrayed by the British Government, and one-fifth by the French Government. The British portion of the new settlement was laid out in eighty-two lots; and so bright appeared the prospect of trade at the time of their sale that 9000 dollars and upwards was paid in more than one instance for a lot, with a river frontage, measuring 12,645 square feet. The depression in trade, however, which soon followed acted as a bar to building, and it was not until the British consulate was erected in 1865 that the merchants began to occupy the settlement in any numbers. The British consulate occupies six lots, with an area of 75,870 square feet in the centre of the site, overlooking the river, and is enclosed with a substantial wall. A ground-rent of 15,000 cash (about £3) per *mow* (a third of an acre) is annually paid by the owners of lots to the Chinese Government.

The Sha-mien settlement possesses many advantages. It is close to the western suburb of Canton, where reside all the wholesale dealers as well as the principal merchants and brokers; it faces the broad channel known as the Macao Passage, up which the cool breezes in summer are wafted almost uninterruptedly, and the river opposite to it affords a safe and commodious anchorage for steamers up to 1000 tons burden. Steamers only are allowed to come up to Canton, sailing vessels being restricted to the anchorage at Whampoa. See CHINA. (R. K. D.)

CANTON, a city of the United States; in Stark county, Ohio, about 118 miles north-east of Columbus, on the Nimishillen Creek. It forms the centre of a large agricultural district, and carries on a thriving trade. Coal and limestone are abundant in the neighbourhood, and the creek affords a good supply of water-power. There are several iron foundries and woollen factories in the town, as well as establishments for the manufacture of reaping-machines. Besides daily papers, two monthly periodicals are published. Population in 1870, 8660.

CANTON, JOHN (1718-1772), an able natural philosopher, was born at Stroud, Gloucestershire, in 1718. At

the age of nineteen, he was articled for five years as clerk to the master of an academy in Spital Square, London, with whom at the end of that time he entered into partnership. In 1746 the science of electricity, which seems early to have engaged Canton's attention, gained a very important addition by the discovery of the principle of the Leyden jar. This event turned the thoughts of most of the philosophers of Europe to that branch of natural philosophy; and Canton, who was one of the first to repeat and pursue the experiment by which the discovery had been made, found his labour rewarded by many valuable discoveries. In 1750 he read a paper before the Royal Society on a method of making artificial magnets, which procured him election as a member of the Society, and the award of its gold medal. The same year he was complimented with the degree of M.A. by the university of Aberdeen; and in 1751 he was chosen one of the council of the Royal Society. Canton was the first in England to verify Franklin's hypothesis of the identity of lightning and electricity, having in 1752 succeeded in attracting the electric fire from the clouds during a thunderstorm. In consequence he prepared a paper, which was read the next year before the Royal Society, on *Electrical Experiments, with an Attempt to Account for their several Phenomena*, in which, among other things, he mentions that he had discovered that some clouds are in a positive and some in a negative state of electricity. About the same time Franklin made a similar discovery in America; and these circumstances gave rise to a lasting friendship between the two philosophers. In 1762 and 1764 he published experiments in refutation of the decision of the Florentine academy, at that time generally accepted, that water is incompressible. These and many other investigations were carried on without any intermission of his work as a schoolmaster, and his too sedentary life brought on dropsy, of which he died on March 22, 1772.

CANTU, or CANTURIO, a town of Italy, in the province of Como, about five miles south of the city of that name, in 45° 44' 24" N. lat. and 9° 7' 49" E. long. It is surrounded with walls, and possesses a parish church with a very fine tower, a town hall, a hospital, and a theatre. In the neighbourhood are iron mines that were wrought in the 10th century. Population, 7429.

CANUSIUM. See CANOSA.

CANUTE, or CNUT (about 995-1035), was the son of Sweyn or Swend, king of Denmark and England. Though only nineteen years of age at his father's death, he was elected by the Danish armament to the English throne (1014). But the English, only recently subdued by Sweyn, did not acquiesce in this disposal of the crown, recalled their old king Ethelred from Normandy, and obliged Canute to withdraw from the country. In the summer of 1015 Canute returned at the head of a vast Danish armament, and had compelled the submission of most of England when Ethelred died, and his son Edmund Ironside became the representative of the old English royal line. In the double election which ensued, Edmund was supported almost solely by London; the Witan of the rest of England decided upon Canute, who had proved himself too formidable a candidate to be set aside. Nevertheless, in five pitched battles fought during the year 1016, Canute found in Edmund more than an equal rival,—a rival, too, that grew more dangerous, as he was recognized to be the champion of the pure English nationality. At length, in the sixth battle, at Assandun in the same year, the English army, weakened and disconcerted by the desertion of Eadric, the traitorous earl of Mercia, was completely overthrown. A division of the kingdom was arranged between the two competitors, but Edmund dying soon after, not without suspicion of treachery, even on Canute's part, the latter became sole ruler of England.

His first care on attaining to undivided power was to remove all who might disturb its tranquillity. The sons of Edmund Ironside were sent out of the kingdom, and Edwy his brother was put to death; while Eadric of Mercia soon met the fate he deserved, and many other leading men were banished or slain. The sternness of Canute's early measures was, however, more the effect of policy than of a cruel disposition, for in a little time he showed himself a just and beneficent ruler. After exacting a danegeld for the payment of his Danish host, he sent it home, with the exception of forty ships and of the household troops that attended on himself. Henceforward he put off the character of conqueror, and governed England like a native Englishman, enforcing the old English laws or enacting wise new ones, repressing disorder, and in every way attending to the interests of his subjects. He was careful of the interests of the church, though it had always been one of the great centres of resistance to Danish invasions, and was not afraid to raise Englishmen, such as Earl Godwin, to the highest posts in his government. A letter written to his English subjects from Rome, to which he had made a pilgrimage, is the best commentary on the motives which directed his reign; he is determined to make amends for the faults of his early years, to persevere in a just and pious government, to repress extortion, and in every way to promote the welfare of his subjects. The internal state of the kingdom was one of unprecedented peace and order, during which it recovered from the ravages and misgovernment of the generation preceding; and he left a happy memory of himself among the people. The well-known story of the rebuke he gave to his flattering courtiers, which rests on excellent authority, is a proof of this; and the well-known song he composed, when rowing near the monastery of Ely, is not only an example of his genial popular sympathies, but entitles him to a place among the creators of English poetry.

He was far more than king of England, however; he was the ruler of a vast northern empire, composed of five or six monarchies though the old historians differ in the enumeration of them. He succeeded to the usual overlordship over Wales and Scotland, asserting it in the latter case by force of arms. Shortly after his secure installation on the English throne, he superseded his brother Harold on that of Denmark; he repelled an attack of the Wends on his dominions there, and in those early times obtained a rectification of the Danish frontier from the emperor of Germany. Though at first unsuccessful in an invasion of Norway, he added that kingdom to his empire in 1028. He was now one of the most powerful and respected rulers of Christendom. He died at Shaftesbury in 1035, in the fortieth year of his age, and the twentieth of his reign. The best proof of his energy and ability is that the heterogeneous and geographically disconnected empire, which he governed so well, fell to pieces immediately after his death. (*Freeman's History of the Norman Conquest*, vol. i.; *Palgrave's History of the Anglo-Saxons*; *Green's Short History of the English People*.)

CANVAS, a name applied to several kinds of stout cloth, made of hemp or linen fibres, and used for the sails of vessels, the ground of oil paintings, and various other purposes. Originally canvas was made solely from hemp, whence the name, which is corrupted from *Cannabis*, the classical and scientific name for the hemp plant. Being most extensively employed as sail-cloth, the term came to designate the sails of a ship generally, for which, however, although hempen canvas is still used, linen or mixed fibres are now more generally preferred.

CAOUTCHOUC. See **INDIA-RUBBER**.

CAPE BRETON, an island of British America, to the south-east of Nova Scotia, from which it is separated by a strait about fifteen miles long and a mile wide, known as the

Gut of Canceau or Canso. It lies between $45^{\circ} 27'$ and $47^{\circ} 3'$ N. lat., and between $59^{\circ} 47'$ and $61^{\circ} 32'$ W. long.; its length from north to south is about 110 miles, its width about 87 miles, and its area 2,650,000 acres. Except on the north-west, the coast is much broken; and the island is nearly divided into two by the large irregular lakes of Bras d'Or, which communicate with the sea by two channels on the north-east. The most important bays are Aspee, St Anne's, Sydney, Mira, Louisbourg, Gabarus, St Peter's, and Mabou; and the principal rivers are the Denys, the Margarie, the Baddeck, the Wagamatcook, the Mabou, and the Grand. There are several fresh-water lakes, of which Lake Ainslie in the west is the most extensive. The surface of the island is broken in several places by ranges of hills of moderate elevation, and the northern promontory consists of a plateau, which in some parts has a height above the sea of 1200 feet. The prevailing rocks belong to the carboniferous formations, interrupted here and there by igneous or metamorphic upheavals. About the half of the surface is said to be capable of cultivation; but in 1861 there were only 198,550 acres cleared and under tillage. In winter the thermometer sometimes falls to 32° and generally to 20° below zero; while in summer it rises to 96° in the shade, and the mean temperature is about 60° . The commercial resources of the island consist chiefly in its timber, its agricultural productions, its minerals, and its fisheries. Nearly covered with forest at the time of its discovery, it still exports pine, oak, beech, maple, birch, and ash. Oats, wheat, turnips, and potatoes are extensively cultivated; horses, cattle and sheep are reared in considerable numbers; and cheese and butter form important items in its produce. Coal, limestone, and gypsum are worked, and excellent iron ore and slate are also to be found. Salt-springs of some value exist in different parts. The coal mines, which are chiefly situated towards the south-east, have been worked from an early period. The Bras d'Or Lakes and the neighbouring seas supply an abundance of salmon, cod, mackerel, herring, shad, and white-fish, and the fisheries employ about 3000 men. The number of schools in 1861 was 212; and in the same year there were 104 churches. The principal sects are the Roman Catholic Church, which had then 33,386 adherents, and the Presbyterians of the Lower Provinces with 19,982. The inhabitants are now mainly of Scottish descent, with a certain proportion of Acadians and Irish. A few hundred Micmac Indians, who are principally employed in making fish-barrels and butter-firkins, are still to be found. By the census of 1871 the total population amounted to 75,483, of whom 5264 were inhabitants of Sydney. In 1861 and 1851 the numbers were respectively 63,083 and 27,580.

Cape Breton was probably discovered by Sebastian Cabot, and its name is understood to have been bestowed in remembrance of Cap Breton, near Bayonne, by the Basque sailors who early began to frequent the coast. In 1629 James Stewart, fourth Lord Ochiltree, settled a small colony at Balaine, on the east side of the island; but he was soon after taken prisoner with all his party by Captain Daniell of the French Company, who caused a fort to be erected at Great Cibun (now St Anne's Harbour). By the peace of St Germain in 1632, Cape Breton was formally assigned to France; and in 1654 it formed part of the territory granted by patent to M. Denys, who made several small settlements on the island, which, however, had only a very temporary success. When by the treaty of Utrecht (1713) the French were deprived of Nova Scotia and Newfoundland, they were still left in possession of Cape Breton, and their right to erect fortifications for its defence was formally acknowledged. They accordingly transferred the inhabitants of Plaisance in Newfoundland to the settlement of Havre à l'Anglois, which soon after, under the name of Louisbourg, became not only the capital of Cape Breton (or Ile Royale, as it was then called), but also the most important military post in that district of French America. When war broke out in 1744 between France and England, the New England colonists determined to attack the island; and in the following year they succeeded in capturing Louisbourg. By the treaty of Aix-la-Chapelle, the town was restored to France; but in the

war that was declared in 1756, it again yielded to the assault of a British force, this time commanded by Admiral Boscawen. On the conclusion of hostilities the island was ceded to England by the treaty of Paris; and on October 7, 1763, it was united by royal proclamation to the government of Nova Scotia. All the troops were withdrawn from Louisbourg in 1768; and when the island was separated from Nova Scotia in 1784, a new capital was founded at the mouth of the Spanish River by Governor Desbarres, and received its name Sydney in honour of Lord Sydney (Sir Thomas Townshend), then secretary of state for the colonies. There was immediately a considerable influx of settlers to the island, which received another important accession by the immigration of Scotch Highlanders from 1800 to 1828. In 1820, in spite of strong opposition, it was again annexed to Nova Scotia. It now sends five members to the Canadian House of Commons.

See Denys, *Description géogr. et hist. des Côtes de l'Amérique septentrionale*, 1672; Pichon, *Lettres et Mémoires du Cap Breton*, 1769; Richard Brown, *A History of the Island of Cape Breton*, 1869, and *The Coal Fields of Cape Breton*, 1873.

CAPE COAST CASTLE, or CABO CORSO, a town of Western Africa, the capital of the British settlements on the Gold Coast, is situated in Upper Guinea, about 70 miles to the W. of Acra, in 5° 5' 24" N. lat. and 1° 13' 38" W. long. It occupies a low bank of gneiss and micaceous

slate, which runs out into the sea and protects the harbour from the violence of the surf. Besides the principal fortress there are two outposts,—Fort Victoria on the west and Fort William on the east. With the exception of the European residences and the houses of the wealthier natives, which are built of brick, the whole of the town is composed of "swish" or mud huts, thatched with rushes, and having the walls white-washed. The population consists mainly of negroes of the Fanti tribe, but there are also a number of mulattoes and a colony of Kroomen. The earliest European settlement on the spot was that of the Portuguese in 1610. In 1652 the Swedes erected the fort of Karlsborg which was captured by the Danes in 1658, by the Dutch in 1659, and by the English in 1664. Since the last date the post has remained in English possession, in spite of the French attack in 1757 and various assaults by the native tribes. In 1827 the public establishments were withdrawn, and the forts were handed over to the mercantile companies; but in 1844 the Government resumed its possession. The population is estimated at about 10,000.

CAPE COLONY

Plate I. **CAPE COLONY** is a large tract of country which forms the most southern part of the continent of Africa, a colony of Great Britain since 1806, named from the Cape of Good Hope, a small promontory on its south-west coast, from the neighbourhood of which the Dutch settlers of 1652 spread out over the land. It lies for the most part between 28° and 34° 50' S. lat., and 16° 30' and 29° 50' E. long. West and south are the Atlantic and Indian Oceans; the Orange River forms the boundary of the colony proper on the north, separating it from Great Namaqua Land, the Kalahari desert, and the Orange River Free State; eastward its limit runs from the Tees River, a headstream of the Orange, along the Storm Berg and down the Kei River from its most easterly source-stream to its mouth, which line separates the colony from Free Kaffre Land, and includes within it the divisions of British Kaffraria added to the colony in 1865. Besides this chief area the colony includes various recently added irregular provinces; these are—the agency of *Basuto Land*, annexed in 1871, consisting of the high valleys of the source-streams of the Orange River, sloping down inward from the Drakenberg mountains, which separate this territory from the colony of Natal; *Herschel*, a native district immediately south of Basuto Land; the magistracy of *Nomansland*, including Griqua Land East, a native territory of northern Kaffraria on the seaward slope of the Drakenberg south-west of Natal; *St John's Territory*, or the upper basin of the St John's or Umzimvubu River on the slopes of the Drakenberg in central Kaffraria; *Pingo Land* and the *Idutywa Reserve*, or the Transkeian territories of southern Kaffraria, bounded by the Bashee River; and *Tambookie Land*, between the Bashee and the Umtata. These latter districts were incorporated with the colony in 1875. It is certain that in a few years the whole of what is now Free Kaffre Land will become British territory, when the Cape Colony will be conterminous throughout with Natal on the north-east; and preliminary steps have already been taken for the extension of the western boundary of the colony to include the immense but thinly inhabited region of Great Namaqua Land, which stretches north of the lower Orange River to Walfisch Bay in 23° S.

The lieutenant-governorship of *Griqua Land West*, better known as the district of the South African diamond fields, which lies north of the Orange River and west of the Free State, annexed to the British empire in 1871, is

strictly a separate dependency of the Crown, but is so intimately connected with the Cape Colony as to be necessarily described along with it.

The extreme breadth of the colony from north to south is about 500 miles, and its length from east to west about 800, its area comprising 230,000 square miles.

The country rises from the sea by a series of terraces, of which the supporting walls are nearly parallel chains of rugged mountains, intersected by deep ravines, rising to a central and highest range, which divides the drainage of the coastal streams from that of the inner tributaries of the Orange River in the north. This central range follows a curve almost identical with that of the coast, at a general distance of about 100 miles from the ocean; from the borders of Natal westward it is known in different portions as the Kahlamba or Drakenberg, the Storm Berg, Zuur Berg, Sneeuw Berg, Winter Berg, Nieuweveld, and Roggeveld. In height its summits appear to average nearly 6000 feet, the highest points being Cathkin peak, 10,300 feet, in the extreme north-east corner of the colony; Compass Berg, in the Sneeuw Berg, 8300 feet; and Bulbouders Bank, in the Nieuweveld Range, which is 7300 feet above the sea. North of this dividing range the inner country slopes gradually to the Orange River, central Bushmanland being a plateau of from 3000 to 4000 feet above the sea. The numerous outer ranges, which form the margins of the terraces that fall towards the ocean, are separated from the central range throughout the greater part of the colony by the arid plateau known as the Great Karroo, nearly 300 miles in length and 60 miles in width north to south, and at an elevation of about 3000 feet above the sea; their general direction is always that of the coast, and they are cut across at intervals by rugged gorges or "kloofs" through which the periodical torrents of the coastal watershed escape to the sea. Two chief ranges may be distinguished, an inner and an outer,—the former having the names of Zwarte Berg, Witte Berg, and Cedar Berg, along a great part of its length, the latter being most prominent in the Outeniqua, Zouderende, Drakenstein, and Olifant Bergen, rising from the south and west coasts. Some points of the inner coast range exceed 7000 feet in altitude, and the outer line appears to average about 4000 feet. In Namaqua Land, in the north-west of the colony, the central and outer ranges, approaching one another and decreasing consider-

ably in height, continuo in an irregular series of chains to the lower Orange River. Within the central range, in Bushmanland, the most remarkable elevations are the chains of isolated flat-topped hills which rise directly from the plains of the Fraserburg and Victoria west districts, known as the Karree and Praam Bergen. The Tafel Berg or Table Mountain, the well-known landmark of the coast, and the nucleus of the peninsula of the Cape of Good Hope, rises to 3582 feet. Though the mountains of the colony and the plateaus between them present bold and picturesque outlines of sharply-defined ranges and vast level plains, the landscape, excepting in the coastal districts, is bare and uninviting, and deficient in water and tree-growth.

Soil.

Nearly two-thirds of the surface of Cape Colony consists of vast arid plains, covered, however, with shallow beds of the richest soil, which only requires the fertilizing power of water to render it available for pasture or agriculture. After the periodical rains, the plateau of the "Karoo" and the great plains of Bushmanland present the appearance of vast fields of grass, but the summer sun reduces them again to a barren and burnt-up aspect. The pastoral lands or "velds," which extend chiefly around the outer slopes and in the east, are distinguished according to the nature of the grass or sedge which they produce as "sweet" or "sour." Shallow sheets of water termed "vleis" accumulate at many places in the flat lands of the interior after rains; and in the dry seasons these spots, where the soil is not excessively saline, are covered with rich grass and afford favourite grazing land for cattle. Only in the extreme southern coastland of the colony is there a soil and moisture supply suited to forest growth, and the first requisite of every settlement in the interior is the formation of a "dam" or reservoir for the collection and saving of a water supply. Out of an area of upwards of 40 millions of acres of occupied lands, according to the census returns of 1865, only 460,000 acres were then under cultivation.

Geology
and
minerals.

Geological knowledge of the vast territory of the colony is as yet imperfect, though sufficient data have been collected to enable the general features of the structure of the land to be mapped (A. G. Bain, *Memoirs on the Geology of the Cape*; Dunn's *Geological Map of the Cape*; Griesbach and Stow in the *Quarterly Journal of the Geological Society*, &c). The following are some of the more striking general features. The whole basis formation of the western province is considered to be granite, lower but more recent than the clay-slate which rests upon it. A remarkable band of porphyritic rock has been traced along the whole of the country between British Kaffraria and the Bokkoveid Mountains in the west, a distance of more than 600 miles. A series of sandstone rocks form the chains of the Zwarte and Lange Bergen. The "Karoo beds," the name given to formations which cover that plateau and the country northward to beyond the Orange River, are believed from the abundance of fossil wood and fresh-water shells to be of lacustrine origin, and contain reptile remains of most remarkable character, unknown elsewhere. In the eastern province, one of the most interesting features of the geology is that of the beds of water-worn pebbles, many hundreds of feet above the present sea-level; indeed there appears to be no doubt that a process of upheaval is still in progress along the whole South African coast, where modern raised beaches, coral reefs, and oyster banks may everywhere be seen. Slight shocks of earthquake have been experienced at various times in the south-western region of the colony. There are records of these in 1739, 1766, 1809, 1811, and 1844. Namaqua Land, north as well as south of the Orange River, is a region composed of the older rocks, gneiss and schists, and is famous for its copper deposits. These appear to have been known as early as 1683, and

have attracted attention at various subsequent periods, but it was not till 1863 that any well-directed efforts were made for the extraction of the copper; at the present time the famous mine of Ookeip in the district of Springbokfontein yields an average of 7000 tons of ore each year. Copper is also known to exist in the Amaapondo country of Kaffraria. Silver has also been discovered in Namaqua Land, but has not yet been successfully worked. Coal seams are known both in the Storm Berg in the extreme east and in the central district of Beaufort, but not in easily workable situations.

The discovery of diamonds north of the Orange River, an event which gave great impetus to all affairs of the colony, was made in 1867, and in the following years people from all parts of the world flocked to the fields. These lie in the eastern portion of the territory known as Griqua Land West, which, as a consequence of the discovery, was annexed to the British empire in 1871. The mining has now become a settled industry, with its accompaniment of a fixed population and rapidly-growing towns. The fields extend between the lower Vaal River and its tributary the Modder; in this region the diamond-producing rock is found in fragments mingled with the detritus of other rocks, occupying various depressions known as "pans," or in the deep torrent beds of the rivers. The diggings are thus distinguished as the *wet*, which lie chiefly along the lower Vaal river, and have been almost abandoned, and the *dry* mines, about Kimberley, Du Toits pan, and Bulfontein, farther south. One of the largest diamonds at first discovered in this region weighed 83 carats, and realized £11,000; several much larger ones have since been found, one of more than 200 carats. Iron ores, hematite, and magnetite abound also in this region, the deficiency of fuel alone prevents the working of mines of great richness.

We have seen that the great water-parting mountain range chain of the colony passes through the centre of the country in a curve parallel to the coast line, from the inner border of Natal to near the western Atlantic coast, forming an outward watershed to the sea of about 100 miles in width, and an inner shed to the Orange River. The streams of the outer shed are constant only in the extreme east of the country; towards the south-west and on the Atlantic coast land their supply is irregular. All partake of the character of mountain torrents,—having numerous falls, flowing in deeply-cut channels, and being low and feeble (in some cases dry) for the greater part of the year, but swollen and rapid in rainy weather. From east round to west the chief are the Kei, Great Fish, Zoudeg, Gamtoos, Gauritz, Breede, Berg, and Olifant; of these only two are navigable for a short distance,—the Breede for small vessels for 30 or 40 miles from its mouth, and the Berg for a few miles from St Helena Bay, on the Atlantic coast. The Orange River, or Gariep, to which the inner shed of the colony drains, rises in the Drakenberg on the border of Natal in the extreme north-east of the colony, and flows westward for about 900 miles to the Atlantic. Its basin includes an area of upwards of 400,000 square miles, but the greater portion of this belongs to the arid deserts of the Kalahari and of Bushmanland. Below its confluence (in about 24° E. long.) with its chief affluent, the Vaal, from the north-east, it has no permanently flowing tributary, receiving only the occasional supplies of the torrent channels which are cut deep in the plateaus and filled only after thunder showers,—so that its volume decreases very much in its passage westward. Its upper valleys are very rugged and have been little explored; the region about the confluence of the Vaal is low and alluvial; but from this to the sea the river is hemmed in by steep and precipitous cliffs, and broken by immense walls

of rock which cause formidable cataracts : of these the fall named Aukurbies (in 20° 40' E. long.), 150 feet in height, is the greatest. The Orange is not navigable excepting for boats for a few miles above its mouth, which is barred.

Lakes are unknown in Cape Colony. Springs are frequent, and in sandstone districts afford excellent water, but in the Karroo country they are generally brackish. Hot or mineral springs occur in several districts.

Coasts and
harbours.

The southern coastland of the colony is generally bold and rocky, the mountains often approaching the shore ; the Atlantic coast, on the other hand, is for the most part low and sandy. The great ocean currents—viz., the Mozambique current which sweeps down round the south of the Cape Colony, and is deflected there over the great bank of Agulhas, the submarine apex of the continent, and the South Atlantic current flowing northward past the Cape peninsula,—give rise to many local and minor currents in opposing directions close to the coast, forming great obstacles to navigation.

The coast is indented by various bays and inlets ; few of these, however, afford convenient harbours, and the only one which is naturally safe in all winds is that of Saldanha Bay on the Atlantic. From eastward round to west, the chief points at which commerce reaches the coast are—the port of East London, at the mouth of the Buffalo River in British Kaffraria, in which extensive harbour works are being constructed ; Port Alfred, or the Kowie mouth, which estuary has also been rendered more commodious by engineering operations, Port Elizabeth, in Algoa Bay, the second port of the colony in point of trade, but with many natural disadvantages ; Plettenberg Bay, of importance in coasting trade ; the Knysna, a land-locked estuary in 23° E. ; Mossel Bay ; False Bay, a wide gulf formed by the peninsula of the Cape of Good Hope, and containing within it the well-sheltered naval station of Simon's Bay ; Table Bay, the harbour of Cape Town, which has been rendered safe by the construction of a great breakwater and docks ; Saldanha Bay, little visited, but one of the finest natural harbours in the world ; and Port Nolloth, the copper port of Namaqua Land, and the terminus of a railway from the mines. Angra Pequena Bay, in 26° 40' S., a British possession on the barren Atlantic coast north of Cape Colony, was formerly visited in obtaining cattle, while the now nearly exhausted guano deposits of Ichaboe and Possession Islands, north and south of it, were being worked. Walvisch Bay, in 22° 50' S., up to which point it is anticipated that the colonial territory will shortly be extended, is an inlet on a desolate waterless coast, affording secure anchorage, and formerly much visited by American whaling ships. Lighthouses are maintained at various ports and headlands on the coast.

Climate
and me-
teorology.

In general character the climate of the Cape Colony is dry, highly salubrious, and milder than that of England ; the atmosphere is clear and buoyant. So extensive, however, is the country, and so diversified in aspect and elevation, that there are naturally many varieties of climate within its limits. As far as moisture is concerned there is a gradual diminution from east to west across the country ; the prevailing winds in the interior are from eastward, and the moisture they draw from the Indian Ocean being expended in great part on the eastern slopes and mountain ranges, the western interior districts are left almost rainless. In the eastern divisions heavy rains and thunderstorms moderate the intense heat of summer, and keep the face of the country fresh and green. The winters are cold, but the air is then clear and agreeable. At Graham's Town the average annual temperature is 63°, ranging from upwards of 100° to a minimum of 35°, and the annual rainfall is about 33 inches. The south-western margin of the country outside the edge of the great Karroo plateau is for eight months of the year supplied with rain showers by westerly

ocean winds. In summer (December, January, February) the dry south-east trade winds blow with great violence. The mean temperature of the year at the Cape of Good Hope is about 62° attaining a maximum of 100° and a minimum of 31°, the average annual rainfall being 24 inches. At Worcester, on the inner border of this region, the yearly rainfall decreases to 12 inches.

The low coast region in the extreme west is subject to great droughts and extreme range of daily temperature ; though it seldom rains there, dense fogs arise at dawn. The climate of the great Karroo plateau, which is about 3000 feet above the sea, is also characterized by severe droughts, by excessive heats during the day in summer, by cold nights, and by sharp cold in winter. Within the water-parting mountains the plains stretching to the Orange River, though also subject to long periods of drought, have a salubrious climate, which is clear and bracing in winter ; while in summer the violent thunderstorms, which occur on an average every three or four days along the mountain ranges, render the air cool and pleasant, filling the water-channels and " vleis," and reviving vegetation. Hot, dry winds from the northern deserts sometimes prevail for two or three days at a time in the central and eastern districts of the interior. Snow seldom falls in the coast region, but in the higher mountain tracts it lies for three or four months in the year. The summit of Table Mountain is occasionally sprinkled with snow for a day or two. Hail-storms are rare, but are of great violence after long droughts. The phenomenon of the mirage is common, both on the coast and in the heated plains of the interior.

Ophthalmia and rheumatism are perhaps the only diseases of the colony which are at all prevalent ; low fevers are common on the flat western coastlands.

Though much of the land of the colony is dry and barren, the flora of the more fertile portions is remarkable and varied. We have seen that the forests are confined to the outward slopes of the extreme margins of the colony,—the only patches of wood deserving the name being found in the Cedar Berg in the west, on two sides of Table Mountain, on the Outeniqua mountains facing the south coast, on the Olifants Hoek near Port Elizabeth, in the vicinity of King William's Town in British Kaffraria, and in the district of the Katberg or Stockenstroom farther inland. The inner slopes of Griqua Land East are also wooded. These patches of forest contain a great variety of useful woods, affording excellent timber ; among the commonest trees are the yellow wood, which is also one of the largest, belonging to the yew species ; black iron wood ; heavy, close-grained, and durable stinkhout ; melkhout, a white wood used for wheelwork ; nieshout ; and the assegai or Cape lancewood.

In no other country do bulbous plants and heaths exhibit so many beautiful varieties ; of the latter several hundred varieties are described. Of pod-bearing plants there are upwards of eighty genera : Cape " everlasting " flowers (generally species of *Helichrysum*) are in great numbers. Several species of aloe are indigenous to the Cape, and form a considerable article of export. The so-called American aloe has also been naturalized. The castor-oil plant and many other plants of great value in medicine are indigenous in great abundance. Among Cape plants which are remarkable in their appearance and structure may be noted the cactus-like Euphorbiae or spurge plants, the *Stapelia* or carrion flower, and the elephant's foot or Hottentots' bread, a plant of the same order as the yam. Hooks, thorns, and prickles are characteristic of many South African plants. There are few indigenous fruits ; the kei apple is the fruit of a small tree or shrub found in Kaffraria and the eastern districts, where also the wild and Kaffre plums are common ; hard pears, gourds, water melons, and species of almond, chestnut, and lemon are also native. Almost all the fruits

of northern and southern Europe have been introduced, and grow in abundance. It is doubtful whether or not a species of vine is indigenous to the Cape, but the cuttings of French vines introduced by the Huguenots who emigrated to the colony on the revocation of the Edict of Nantes, between 1685 and 1688, have given rise to an extensive culture in the south-western divisions of the colony, the grapes being among the finest in the world. The Cape wines, the export of which has revived of late years, are chiefly those known as Constantia, Pontac, Steen, and Hanepoot.

Of the cereals, wheat is grown throughout the colony, but chiefly in the low marginal division of the south-west and in the eastern midland districts; barley and oats are general. Rye gives its name to the Roggeveld in the west, and is chiefly grown there and in the lower hills of Namaqua Land; maize and millet are cultivated in all moist situations of the north-east of the colony. Rice might be extensively cultivated, and flourishes on the inundated banks of the Olifants River in the west; the growth of potatoes has been much extended; melons, cucumbers, beans, and pease are grown universally where there is water. Cotton has been introduced experimentally in some districts; the cultivation of tobacco is wide spread, that of the division of George, grown in the valley of the eastern Olifants River, being most reputed.

The larger and more important of the wild animals which once gave the Cape Colony the character of the great hunting ground of the world have retreated before advancing civilization, and few are now found within the frontier. The lion is only to be met with now in the northern districts of Bushmanland and in the extreme north-eastern portion of the colony, and rarely in British Kaffraria. The elephant, which also abounded at the time of the first Dutch settlement, is now almost extinct in the colony, a few only existing in the forests between Knysna and the Zondag River in the extreme south. The rhinoceros and giraffe have been driven far outside the frontier. Hippopotami are only found in the coast rivers of British Kaffraria and in the lower Orange River. The buffalo remains only perhaps in the Knysna forests and in the thickets of Great Fish River. The Cape leopard, the hyena, the aard wolf or *Proteles*, and the jackal alone keep their ground, and are still common in the colony. Quaggas and zebras are met with in large herds in the plains of the Vaal, and sometimes extend into the colony as far as the divisions of Cradock and Graaf Reinet, where the gnu, hartebeeste, and brindled gnu are also seen. Of the many varieties of South African antelope the larger kinds—the eland, koodoo, and sable and roan antelopes—are now banished from the colony, though the smaller varieties are found along the coast region, and migratory herds of springbok invade the plains of Bushmanland and Little Namaqua Land at certain seasons. Ostriches, once numerous, are still thinly scattered over the colony, though the supply of feathers is now mainly derived from regions north of the Orange River. Ostrich farming and artificial incubation, carried on in the northern, western, and eastern divisions, have, however, become of late years one of the most profitable industries of the Cape,—the feathers being worth from £30 to £60 per lb.

Birds of prey, including the bearded vulture, aasvogel, and several varieties of eagles, hawks, and falcons, are numerous; cranes, stocks, flamingoes, and pelicans are in large variety; partridges and pheasants, guinea fowl, and quails abound. The bustard is found in several kinds, as well as ducks, wild geese, and plovers.

Upwards of forty varieties of edible fishes are caught in the seas surrounding the Cape Colony, the waters of which also teem with whales, seals, and sharks. Reptiles are exceedingly numerous; among the venomous snakes are the

cobra di capello and the puff adder; large toads and frogs are also common, as are scorpions, tarantula spiders, hornets, and stinging ants.

Sheep, cattle, and dogs of an inferior breed were possessed by the natives on the discovery of the country. Horses, asses, goats, and cattle, introduced by the earlier colonists, were found to thrive well. The merino breed of sheep is now rapidly taking the place of the big-tailed sheep of the Dutch settlers; and some of the central divisions have immense sheep farms, producing the wool which is the great staple of the country's export trade. The angora goat is now extensively farmed, the hair being largely exported. Cows of the finest breeds have also been imported; the introduction of the English horse does not, however, appear to have been successful, the older, heavier Spanish breed being better adapted to the wants of the country.

The numbers of live stock in the Cape Colony and its native districts are estimated thus for 1875:—

Sheep.....	11,500,000
Draught Oxen.....	500,000

The Cape of Good Hope was discovered by Bartholomew Diaz, the Portuguese navigator, in 1486. He first landed at Algoa Bay, having, after exploring the west coast, been driven out to sea by a storm. Thus accidentally doubling the Cape, he saw it on his way back, and gave it the name of the Cape of Storms (Cabo Tormentoso).

The king of Portugal, however, gave it the more auspicious name it now bears, as its discovery afforded a hope of a new and easier way of reaching India, the great object of all the maritime expeditions of that age.

The great navigator Vasco de Gama doubled the Cape in 1497, and carried the Portuguese flag into the Indian seas. His countrymen, however, attracted by the riches of the East, made no permanent settlement at the Cape, although they frequently touched there on the voyage to India. But the Dutch, who, on the decline of the Portuguese power, established themselves in the East, early saw the importance of the place as a station where their vessels might take in water and provisions. They did not, however, colonize it till 1652, when the Dutch East India Company directed Jan Van Riebeeck, with a small party of colonists, to form a settlement there. The country was at that time inhabited by a people called Quæque, but to whom the Dutch seem to have given the name of Hottentots. The Riebeeck settlers had at first great difficulties and hardships to endure, and their territory did not extend beyond a few miles round the site of the present Cape Town, where they first fixed their abode. They gradually, however, extended their limits, by driving the natives back or reducing them to serfdom. These colonists, although under Dutch authority, were not wholly of that nation, but consisted partly of persons of various nations, especially Germans and Flemings, with a few Poles and Portuguese. They were for the most part people of low station or indifferent character; there was, however, a small number of a higher class, from whom was selected a council to assist the governor. About the year 1686 the European population was increased by a number of the French refugees who left their country on the revocation of the Edict of Nantes. Our limits forbid our attempting to trace the history of the Cape Colony during the lengthened period it remained under the Dutch Government. We may, however, mention some of its prominent incidents, the effects of which are visible in the colony to this hour.

1st, The Dutch, partly by so-called contracts, partly by force, gradually deprived the Hottentots of their country. 2d, They reduced to slavery a large part of that unfortunate people whom they did not destroy. 3d, They introduced a number of Malays and negroes as slaves. 4th, They established that narrow and tyrannical system of policy which they adopted in other colonies, prescribing to the farmers the nature of the crops they were to grow, demanding from them a large part of their produce, and harassing them with other exactions tending to discourage industry and enterprise. There is no doubt that to this mischievous policy is due the origin of those unsettled habits, that dislike to orderly government, and that desire to escape from its control, which characterize a considerable part of the so-called Dutch boers of the present day,—qualities utterly at variance with the character of the Dutch in their native country, which were strongly manifested at the Cape, long before they came under British rule and under those influences to which some exclusively attribute the insubordination of those men. The attempts of the boers to escape from the Dutch power, and so form an independent government beyond the borders of the colony, especially in the district since called Graaf-Reinet, are strikingly similar to their proceedings at a later date under the British Government. 5th, The Gamtoos River formed the boundary between the Hottentot and Kaffre races, and was early adopted by the Dutch as their eastern limit, but about the year 1740 they began to pass this river, and came into collision with the Kaffres, and in 1780 they extended their frontier to the Great Fish River.

In 1795 the colonists, having imbibed the revolutionary principles then prevailing in Europe, attempted to throw off the yoke of the Dutch, upon which the British sent a fleet to support the authority of the Prince of Orange, and took possession of the country in his name. As, however, it was evident that Holland would not be able to hold it, and that at a general peace it would be made over to England, it was ruled by British governors till the year 1802, when, at the peace of Amiens, it was again restored to Holland. In 1806, on the renewal of the war, it was again taken by the British under Sir David Baird, and has since remained in their possession, having been finally ceded by the king of the Netherlands at the peace of 1815. At this time the limit of the colony was formed by the Great Fish River and the line of the mountains south of Bushmanland to the Buffels River and the Atlantic, the area being about 120,000 square miles, and the population little over 60,000. A summary may be given of the chief events which have taken place since 1806.

1st, *The Kaffre Wars*.—The first of these wars took place in 1811–12, and the second in 1819, when the boundary of the colony was extended to the Keiskamma. The third occurred in 1835, under Sir Benjamin D'Urban, when the boundary was advanced to the Kei; but on the recall of that officer the country between the Kei and Keiskamma rivers was restored to the Kaffres. The fourth Kaffre war took place in 1846, and after being conducted by governors Maitland and Pottinger, it was terminated by Sir Harry Smith in 1848. The fifth war broke out at the end of 1859, and after being for some time carried on by Governor Sir H. Smith, it was conducted in 1862 by Governor Cathcart, and brought to a conclusion only in March 1863. During its progress an armed police had been organized for the protection of the frontier, and British Kaffraria was subsequently formed into a Crown colony, reserved at first for occupation by Kaffres. A somewhat more detailed account of these wars will be found under the heading KAFFRARIA.

2d, In 1820, British emigrants, to the number of 5000, arrived at Algoa Bay, and laid the foundation of the settlements on the eastern frontier which have since become the most thriving part of the colony, including the important towns of Graham's Town and Port Elizabeth.

3d, In 1834 the great measure of slave-emancipation took effect in the Cape Colony. It has been of immense service in raising the character and condition of the Hottentots and other races heretofore held in bondage, though many of the vices begotten by the state of

slavery still adhere to them. This measure gave great offence to the Dutch boers of the colony, and completed their already existing disaffection to the British rule.

In 1835–6 a large number of these people resolved to free themselves from the British Government by removing with their families beyond the limits of the colony. With this object they sold their farms, mostly at a great sacrifice, and crossed the Orange River into territories inhabited chiefly by tribes of the Kaffre race. After meeting with great hardships and varied success in their contests with the natives, a part of their number, under one Peter Retief, crossed the Drakenberg Mountains and took possession of the district of Natal, where they established a republican government, and maintained their ground against powerful nations of Zulu Kaffres till 1842, when they were forced to yield to the authority of the British Government, which took possession of Natal.

The boers beyond the Orange River and west of the Drakenberg still, however, retained a sort of independence till 1848, when, in consequence of the lawless state of the country, and the solicitation of part of the inhabitants, the governor, Sir Harry Smith, declared the supremacy of the Crown over the territory, which was thenceforth called the Orange River Sovereignty. Shortly after this, in consequence, it was alleged, of certain acts of the British Government in Natal, Andrew Pretorius, an intelligent boer of that district, crossed the Drakenberg Mountains with his followers, and after being joined on the western side by large numbers of disaffected boers, raised the standard of rebellion. Upon this the governor, Sir H. Smith, crossed the Orange River at the head of a detachment of troops, and encountered and defeated the rebels in a short but brilliant skirmish at Boon Plaat. After this Pretorius and the most disaffected part of the boers retreated to beyond the Vaal River (the northern limit of the sovereignty), where they established a government of their own. They were subsequently, in 1852, absolved from their allegiance to the British Crown by treaty with the governors and her Majesty's commissioners for settling frontier affairs.

In 1853–54, in consequence of the troubled state of the Orange River Sovereignty, and the difficulty of maintaining with becoming dignity the authority of her Majesty there, it was resolved to abandon the country to the settlers, mostly Dutch boers. This was carried into effect by a special commissioner, Sir George Clerk, sent from England for the purpose; and the country, under the name of the Orange Free State, is constituted a republic, with a president at its head, assisted or controlled by an assembly called the Volksraad (people's council), elected by nearly universal suffrage.

4th, *The Convict Agitation*.—After the British Government had felt itself compelled to discontinue the sending of convicts to New South Wales and Van Diemen's Land, the subject of transportation became one of great difficulty, the more so that an unusually large number of prisoners was then on its hands in consequence arising out of the disturbed state of Ireland. In consequence an Order in Council was passed in 1848, under authority of the Act of 5 Geo. IV., authorizing the secretary of state to send certain convicts to such colonies as he might think proper. A circular was sent by Earl Grey, then colonial secretary, to the governor of the Cape (among other colonial governors), requesting him to ascertain the feelings of the colonists regarding the reception of a certain class of convicts. Unfortunately, owing to some misunderstanding, a vessel, the "Neptune," was despatched to the Cape before the opinion of the colonists had been received, having on board 289 convicts, among whom were John Mitchell, the Irish rebel, and his colleagues. When the news reached the Cape that this vessel was on her way, the people of the colony became violently excited; and goaded to fury by the inflammatory articles in the local newspapers, and guided by a few demagogues, they established what was called the *Anti-Convict Association*, by which they bound themselves by a pledge to cease from all intercourse of every kind with persons in any way connected "with the landing, supplying, or employing convicts." On the 19th of September 1849, the "Neptune" arrived in Simon's Bay; and when the intelligence reached Cape Town, the people assembled in masses, and their behaviour was violent and outrageous in the extreme. The governor, after adopting several resolutions, and again abandoning them under the pressure of popular agitation, agreed not to land the convicts, but to keep them on board ship in Simon's Bay till he received orders to send them elsewhere. Even this concession did not satisfy any but a small number of more moderate men. The mass of the population, under the guidance or domination of a few agitators, continued to do all in their power to prevent the convicts and all the officers of the Government from obtaining supplies. When the Home Government became aware of the state of affairs it immediately sent orders directing the "Neptune" to proceed to Van Diemen's Land, and the agitation ceased. This agitation did not, however, pass away without important results, since it led to another movement, the object of which was to obtain a free representative government for the colony. This concession, which had been previously promised by Lord Grey, was granted by her Majesty's Government, and, in 1853, a constitution was established of almost unexampled liberality.

5th, In 1857 an almost incredible delusion arose in the Amazosa

tribe of British Kaffraria. It was predicted among them that, on condition of a complete sacrifice of their lives and property, a resurrection would take place on a certain day, in which all the dead warriors and great men of the nation would arise in new strength; and acting upon this faith nearly a third of the tribe, or about 50,000, perished in a national suicide. The tracts thus depopulated were afterwards peopled by European settlers, among whom were many of the German legion which had served with the English army in the Crimea, and a body of upwards of 2600 industrious North German emigrants, who proved to be a valuable acquisition to the colony.

6th, Public works in the colony marked an era in the opening, in November 1853, of the railway from Cape Town to Wellington, begun in 1850, and, in 1859, of the great breakwater in Table Bay, long needed on that perilous coast. In 1855 the province of British Kaffraria was incorporated with the colony, under the title of the Electoral Divisions of King William's Town and East London. In the same year several important modifications of the constitution were adopted.

7th, The discovery of diamonds in the districts north of the Orange River in 1867 drew the attention of the whole world to the colony, and gave new life and impetus to every branch of industry, leading to the annexation of the large territory of Griqua Land West to the British Crown. The Basutos, a division of the Beshwana Kaffres, occupying the upper valleys of the Orange River, had subsisted under a semi-protectorate of the British Government from 1843 to 1854; but having been left to their own resources on the abandonment of the Orange Sovereignty, they fell into a long exhaustive warfare with the boers of the Free State. On the urgent petition of their chief Moshesh, they were proclaimed British subjects in 1858, and their territory became part of the colony by Act of Government of 1871.

8th, More recently, in 1874 and 1875, large areas of southern and northern Kaffraria, the Transkei territories of the Fingo and Tambookie tribes, and the territory of Griqua Land East on the southern border of Natal, have also come under British rule by the free consent of their inhabitants. At the present moment attention is strongly directed towards the consolidation of the European states of South Africa, and the introduction of greater unity in their hitherto conflicting systems of government, with a view to the more complete development of their great natural resources.

A sum of five millions sterling voted by the Government is now (1876) being expended in the construction of four trunk lines of railway:—one extending the already existing line from Cape Town, two from Port Elizabeth, and one from East London. The telegraphic wire now connects Cape Town with Port Elizabeth, Grahamstown, King William's Town, East London, Queenstown, Beaufort West, Graaf Reinet, Cradock, Colasberg, and Kimberley in the diamond fields. Five steamers now run between England and the Cape each month.

Divisions
and chief
towns.

Until the year 1873, the colony was divided for the purposes of administration and election of members for the Legislative Council into two provinces, a western and an eastern; but with the growth of the colony these were found to be inconveniently large, and by an Act of Government, which became law in 1874, the country was partitioned out into seven provinces; at about the same time some new divisions were formed within them by the reduction of those already existing. Space does not admit of a special description of each of these divisions; the following table, however, shows their approximate area and the increase of their population from the date of the first census in 1855 to that of 1875. The native districts recently added to the eastern side of the colony are governed by Government agents and resident magistrates, who are under the direction of the secretary for native affairs in Cape Town.

The returns of population classified according to race People have not yet been received for the census of 1875. In 1865 the Europeans of the colony numbered 187,400 or about 33 per cent. of the whole. The white or dominant population is composed of colonial Dutch, who are most numerous in the western divisions; of Anglo-Saxons, who

² Formerly British Kaffraria.

³ Including 18,445 Tambookies of the "location" in Wodehouse and North-Eastern Queenstown.

⁴ Griqua Land East (1875), pop. 31,901: country west of Griquas, pop. 8407.

⁵ Including emigrant Tambookies now in colony.

are in a majority in the east; and, in smaller proportions, of Germans, descendants of French emigrants, and Portuguese. English, which is the language of the legislation, is used in the seaports and eastern border towns, but Dutch is still commonly used in many parts of the western and midland provinces. Of thirty newspapers published in the colony twenty-five are English.

The major part of the population of the colony, however, consists of Hottentots, Malays, Negroes, and Kaffres. The aborigines with whom the first settlers at the Cape came in contact had originally the generic name of Quaque, and received the name of Hottentots from the Dutch. Owing to intermarriages with Malays, Negroes, and others, and illicit intercourse with the whites during the period of slavery, the race has lost much of its distinctive character. In 1865 the number of people distinguished as Hottentots was 82,000, nearly two-thirds of whom were found in the western division. The Malays were introduced by the Dutch as slaves; their descendants still retain the Mahometan religion, and most of the distinctive habits and customs of their race. We have no means of ascertaining their number, but it cannot be large. They are found chiefly resident in the seaports. The negroes are mostly from the eastern coasts of Africa. Griquas or Bastards are a mixed race sprung from the intercourse of the Dutch boers or farmers with their Hottentot slaves. A great number of them migrated from the colony in the early part of this century with the boers, and settled between the Orango River and the Vaal under the chiefs Waterboer and Adam Kok, in part of the territory now known as Griqua Land West. In 1852 Kok's people (about 15,000 in number) separated from the others, and migrated to the district called Nomansland south of Natal, which had been depopulated by the strifes of the Amapondo and Amabaca Kaffres, forming there the settlement called Griqua Land East or New Griqua Land.

The line of division between the native Hottentot (or Bushman) and Kaffre races of South Africa passes south through the Cape Colony in about 26° E. long. The Kaffres now resident within the colony proper are chiefly of the tribe of the Amakosa, with whom the colonists first came in contact at the line of the Great Fish River in 1778, and the Fingoes, who originally came from Natal and its vicinity; driven thence early in the present century by Chaka, a warlike chief of the Zulu Kaffres, they took refuge with the tribes on the border of Cape Colony. There they were reduced to a state of serfdom, from which they were liberated by Sir Benjamin D'Urban after the third Kaffre war of 1835, when a body of 16,000 of them came into the colony and settled in what is now the division of Peddie. From this, again, the greater part of the Fingoes have moved to the district now called Fingo Land, east of the River Kei, recently joined to the colony. In 1865 the number of Kaffres within the limits of the colony was not less than 164,500. The Kaffres of the native districts which have come under British rule during the last three years are—

(1.) The Basutos, sometimes called Mountain Bechwana, the fragments of several broken tribes of the Bechwana Kaffres which became united under the rule of Chief Mosheshi. Besides the inhabited districts of Basuto Land, they now occupy the portion of Nomansland which lies between Griqua Land East and the range of the Drakenberg. (2.) The Ama-baca, who appear to be divided,—one portion of the tribe inhabiting the eastern third of Nomansland on the borders of Natal; the other, under Chief Makaula, the north-eastern portion of St John's Territory. (3.) The Ama-xesibi, under Chief Jojo, in the country immediately south of Griqua Land East. (4.) The Pondomis, under the chiefs Umhlouhlo and Umditchwa, occupying the southern portion of St John's Territory. (5.) The Lehana, Zibi, and Lebonya, small mountain tribes along the north-west side of St John's Territory. (6.) The Tambookies, one of the most numerous and powerful of the Kaffre tribes, located in part within the

colony proper, in the south-east of the division of Wodehouse and the north-east of Queenstown, and in part occupying the adjoining basin of the Tsomo, a tributary of the Kei River, in the districts of their chiefs Geecelo, Stockwe, Matanzima, and Darala. The Tambookies under Gangelizwe occupy the tract between the Basuto and the Umata.

All these are now directly under British rule. The following tribes of Kaffraria, enclosed by British territory, still retain their independence. (1.) The Ama-pondo, the largest tribe between the Cape Colony and Natal. These were also formerly driven from a more northerly region by the Zulu Kaffres, and now occupy the country on each side of the lower St John's River, under their paramount chief Umquikela Faku, his brother Damas ruling a smaller southern division of the tribe; their numbers are estimated by missionaries resident among them at not less than 160,000. (2.) The Gcalecas and Bom-Vanas (Ama-bonivane), on the east-land between the Kei and the Umata Rivers, of whom Kreli is paramount chief, Moni the chief of the Bom-Vanas acknowledging his supremacy.

Prior to 1827 there existed in the several districts of Government the colony an institution established by the Dutch called the Board of Landrost and Heemraaden. The landrost was the chief magistrate of the district, appointed and paid by the Government. The heemraadon was a council to assist him, composed of respectable inhabitants appointed by the governor, on the recommendation of the landrost. These boards not only had the administration of the local affairs usually entrusted to municipal bodies, but they also possessed extensive judicial authority. In consequence of abuses, more especially in the exercise of the latter functions, these institutions were abolished in 1827.

Prior to 1837 the whole authority of the general Government was vested in the governor, assisted by a small council of officials. In that year a legislative council was established, consisting of certain Government officials, and five persons nominated by the Crown. An executive council was also established to assist the governor in executive matters, consisting of certain high officers of Government. Such was the form of government till 1853, when the legislative council as thus established was abolished, and a new constitution introduced. Under this the legislature consists of the governor, appointed by the colonial office for a term of six years, and two chambers, called the legislative council and the house of assembly, both elected by the people. The former body was latterly composed of eleven members for the western and ten for the eastern province, chosen by the whole body of electors. But in 1873 a bill was introduced for dividing the country into seven electoral provinces, to give a more equable distribution of political influence, and to do away with the separation of the colony into two parts; and by this arrangement each of the new divisions is to return three members to the upper chamber. This bill became law in 1874, but does not come into execution until the dissolution of the existing council by expiration of the time of its session. To qualify a man to be elected for this chamber, he must possess property in land worth £2000, clear of charges, or £4000 in landed and personal property together; he must be thirty years of age, and must have been invited to become a candidate by written requisition, signed by not less than twenty-five electors. The voting in this election is enmulative,—that is, any elector may give all his votes (as many as there are members to be chosen) to one candidate, or he may distribute them among the candidates as he pleases. The council is elected for ten years, but so that half its number, as near as may be, go out every five years.

The legislative assembly is chosen by the electors of the towns and other electoral districts into which the colony is divided. The candidates have to be proposed and seconded at the hustings. There is no property qualification required of the candidates. The assembly consists of sixty-eight members, and is elected for five years.

The qualification of electors of both houses is the same, namely, the occupation of fixed property worth £25, or the

receipt of wages of not less than £50 a year. The ministry under the governor includes a colonial secretary or premier, a commissioner of crown lands and public works, an attorney-general, a treasurer-general, and a secretary for native affairs. Since 1872 the ministry holds office, like the English cabinet, at the pleasure of the Parliament.

The governor may dissolve both houses, or he may dissolve the house of assembly without dissolving the council. He may give or refuse his assent to bills in the Queen's name, or he may reserve them for the decision of her Majesty. The Queen may disallow any bill assented to by the governor at any time within two years of its receipt. It is further provided, that all bills appropriating any part of the revenues must be recommended to the house of assembly by the governor.

The administration of justice is presided over by a supreme court of five judges—a chief justice and four puisne judges. The chief justice with two judges holds the supreme court in Cape Town; two other judges of the supreme court form the "court of the eastern districts" held at Graham's Town. The jurisdiction of the court of Cape Town extends over the whole colony; that of Graham's Town has a concurrent jurisdiction over the eastern divisions. Circuit courts are held throughout the colony twice yearly. Each division has a salaried magistrate who is also civil commissioner, and the magisterial courts have a limited jurisdiction in civil and criminal cases. The civil commissioner presides over the "divisional council" of his district, an elected body charged with the superintendence of roads, boundaries, and other interests of the division. The Roman or civil law, as received in Holland before the introduction of the Code Napoleon there in 1811, was in force in Cape Colony at the time of its cession to Britain, and remains authoritative, though a few modifications have been sanctioned by Parliament.

The Cape Colony possesses important British military and naval stations; and the establishment maintained by the Home Government has always been very considerable. This was especially the case during the Kaffre wars. In recent years, however, a gradual reduction of the number of imperial troops in the colony has taken place. In 1873 two British infantry regiments, with detachments of the Royal Artillery and Engineers, were quartered in the colony; but these are kept at the Cape rather for the purposes of the Home Government than for the domestic defence of the colony. A force named the Frontier Armed and Mounted Police was organized for the latter purpose in 1853, and has been specially serviceable in quelling disturbances on the interior borders of the country. This force is divided into seven troops, and numbers 750 men. Small volunteer corps of rifles and cavalry have been organized at various points of the eastern and western divisions.

Religion.

The greater number of the Protestant denominations of the United Kingdom, as well as the Roman Catholic Church, are represented in Cape Colony. The Dutch Reformed Church, as might be anticipated from the early history of the country, is by far the most numerous community. In form of government and in order of service it closely resembles the Church of Scotland, to which country a considerable number of its ministers belong. The Church of England has, perhaps, the next smaller number of adherents. In 1847 a bishop of Cape Town was appointed to preside over this church, whose diocese extended not only over Cape Colony and Natal, but also over the island of St Helena. Later, however, separate bishops were appointed for the eastern province (with the seat at Graham's Town) and for Natal. Wesleyan Methodists nearly equal the Anglicans in number, and have a larger proportion of coloured people in their body than any other sect. The Congregationalists, including Independents

and Baptists, are an important body. Lutherans, Presbyterians, and other Protestant communities, such as the Moravians, are in smaller numbers. The Roman Catholics have bishops in Cape Town and Graham's Town, but are comparatively few. Government provides an annual grant for ecclesiastical purposes, which is distributed among the various religious bodies, the Congregationalists alone declining to receive aid from the state. According, however, to the provisions of the "Voluntary Act," recently passed, the grants in aid are to be continued only to present incumbents. There are besides several foreign missions in the colony, the most important being the Moravian, London, and Rhenish missionary societies. The Moravians have been established there since 1732, and have laboured hard to convert the native races.

As early as 1839 a scheme of public schools, drawn up by Sir John Herschel, came into operation, which was well adapted to the condition and circumstances of the colony at that time. The Education Act of 1865, now in operation, is an advance on this system, and provides three orders of schools adapted to the wants of the main grades of the population, the Europeans, mixed races, and pure natives. These orders comprise—(1) Undenominational public schools in each division of the colony in three classes, subject to the inspection of a superintendent-general of education, and having teachers whose salaries are guaranteed; (2) Schools established by missionary societies to which Government aid is granted under certain conditions for secular education; (3) Day schools and industrial institutions for the civilization of the aborigines on the frontiers of the colony. For higher education there are several colleges. The South African college in Cape Town was founded in 1829, and in its higher classes prepares for the European universities and for colonial examinations; the college has a grant of £400 annually from Government. Graaf Reinet College, on the same plan, has a similar subsidy. The Grey Institute, in Port Elizabeth; Gill College, in Somerset East; the Diocesan College, under the bishop of Cape Town, the first of the institutions of a purely denominational character; the Theological Seminary of the Dutch Reformed Church at Stellenbosch; and four educational institutions of the Roman Catholic Church, are the other schools of higher education which are chiefly worthy of note. A public university, founded on the plan of that of London, arose out of and superseded the Board of Public Examiners (which had been constituted in 1858), and stands at the head of the educational system of the colony; it was established by Act of Parliament in 1872. Liberal bursaries and scholarships have since been attached to it, enabling students to continue their studies in Britain. The hospital of Cape Town is so far recognized as a medical school by the Colleges of Surgeons and Physicians, that students are allowed to spend two years of their course there in qualifying for their degrees.

The leading public institutions of the Cape Colony—the Royal Observatory, the South African Public Library and Museum, and the Botanic Garden and Government Herbarium—are noticed under CAPE TOWN below. The Albany or Graham's Town Museum, the chief of the provincial institutions of this kind, perhaps surpasses that of the capital in its collections and classification of the natural products of Southern Africa. A colonial medical committee, appointed by Government and presided over by a Government inspector of hospitals, is at the head of the curative institutions of the colony, the chief of which are the hospitals of Cape Town, the infirmary at Robben Island, and those of Port Elizabeth, Graham's Town, and King William's Town, with the numerous gaol hospitals throughout the country.

Public Institutions.

The Press. The first newspaper of the colony, written in Dutch and English, was published in 1824, and its appearance marked an era not only in the literary but in the political history of the colony, since it drew to a crisis the disputes which had arisen between the colonists and the somewhat arrogant governor, Lord Charles Somerset, who had issued a tyrannical decree prohibiting all persons from convening or attending public meetings. Its criticisms on public affairs soon led to its suppression by the governor, and a memorial from the colonists to the king petitioning for a free press was the result. This boon was secured to the colony in 1828, and the press soon became a powerful agent, characterized in an especial manner by public spirit and literary ability. There are now about fifty newspapers and periodicals in English and Dutch, published in the Cape Colony and Natal.

Trade. The following table, giving the value of imports and exports and the tonnage of shipping in several years, taken at intervals, exhibits the progress of the commerce of the colony:—

Year.	Imports.	Exports.	Shipping.
			Tons.
1836	£541,038	£362,280	134,875
1840	732,494	775,060	184,442
1850	1,277,101	637,252	224,126
1860	2,665,902	2,080,398	329,934
1870	2,352,043	2,453,768	335,509
1874	5,558,215	5,138,838	691,855

In the order of the amount and value of their commerce the ports of the Cape Colony rank thus:—Port Elizabeth, Cape Town, East London, Mossel Bay, Port Alfred (Kowie mouth), and Simon's Town,—the value of the trade of Port Elizabeth being more than double that of Cape Town.

The following table gives the quantities and values of the chief articles, the produce of the colony, exported during 1874:—

	Quantity.	Value.
Aloes.....lb	614,272	£5,526
Argol (crude tartar)	75,598	2,263
Copper Ore	13,646	321,434
Corn, Grain and Meal—		
Barley	148,260	747
Beans and Pease.....	70,443	469
Bran	94,500	520
Flour	303,827	3,202
Maize	710,766	2,197
Oats.....	679,596	5,337
Wheat.....	35,411	496
Cotton.....	15,117	257
Diamonds.....No	2,893	8,148
Feathers (Ostrich).....lb	36,829	205,610
Fish, cured.....	4,872,814	34,339
Fruit, dried.....	332,762	5,078
Hair, Angora	1,036,570	107,139
Hides.....No	68,458	49,425
Horns	134,154	1,900
Horses	48	1,925
Ivory.....lb	73,747	26,667
Skins, Goat.....No	1,478,761	194,323
„ Sheep.....	1,462,367	144,538
Spirit, Brandy.....Galls.	718	245
Wine, Constantia	1,655	1,272
„ Ordinary.....	77,802	15,376
Wool	42,620,481	2,948,571
Other Articles.....		51,299
Add, for unregistered diamonds.....		1,000,000
Total value.....		£5,138,838

The most important item of export is wool, and the following table shows the progress of the trade in this product, which is now almost monopolized by the eastern ports:—

Exports.	
Port Elizabeth (with Port Alfred and East London)	Cape Town (with Port Beaufort and Mossel Bay)
lb	lb
1833.....	39,753
1840	401,521
1850.....	4,323,650
1860.....	19,438,566
1870.....	33,809,934
	73,324
	509,597
	1,589,277
	3,734,219
	3,478,357

The number and value of the diamonds exported cannot be judged by the figures in the above table, since but few parcels of them are entered as freight. The whole declared value of the diamonds exported from the year of their discovery till 1874 was £743,000, but it is believed that diamonds to the value of upwards of £10,000,000 have been taken from the mines of Griqua Land West.

The copper ore of the Cape Colony is derived from the mines in Namaqua Land. Since 1863, when this branch of mining became a settled industry, and the Cape Copper Mining Company was formed, the exports of ore have risen steadily from an annual total of 2900 tons to upwards of 13,000 tons. Wine was at one time the staple export, and was imported in large quantity by England, falling into disrepute there, the industry remained in a depressed state for many years, but revived on the impulse given by the discovery of diamonds, and besides acquiring an increased consumption in the colony is again rising as an export.

The imports of the colony consist mainly of manufactured goods, cloths and hardwares, sugar and tobacco. The revenue of the colony is derived chiefly from an *ad valorem* tax on all goods imported (with the exception of agricultural machinery, animals, bullion, books, and unmanufactured African products), and on land sales and rents, and from a tax called transfer-dues on the purchase money of all landed property sold, stamp-duties, and postages. The expenditure is for payment of salaries of officials and support of government. The colony incurs the expense of the regiments of Cape mounted riflemen and police, but the British troops in the colony are maintained by the Imperial Government at an annual cost of about £200,000. The subjoined table shows the progress of the revenue and expenditure of the colony:—

	Revenue.	Expenditure.
1832	£130,808	£126,889
1840	171,205	181,653
1850.....	245,785	245,655
1860.....	742,771	729,689
1870.....	831,211	795,695
1873.....	2,078,220	2,159,658
1874.....	1,907,951	1,199,970

The revenue of 1873 was abnormally increased by the raising of a loan of £860,000, included in the statement. While the increased expenditure was caused by outlay on public works. The revenue of 1874 was increased by a loan of £369,400. The colony has a public debt, bearing interest at the rate of 6 per cent., dating from 1859. The debt had reached the amount of £1,723,000 in 1874.

CAPE TOWN, the capital and seat of government of Cape Colony, lies at the head of Table Bay, on the northern side of the peninsula formed by Table Mountain, and 30 miles north of the Cape of Good Hope. It was founded in 1652 by Van Riebeeck, and at first consisted of a few houses under the shelter of a fort, at the mouth of the Zoeta or "Sweet Stream," on the site of which the still existing castle was built. The chief streets of the increasing town were subsequently laid out at right angles, but the outer streets and suburbs extend irregularly upwards. The town is now paved, and lighted with gas, and has a regular water supply. Its architecture generally

retains the features given to it by the earlier settlers, the houses being of brick faced with stucco, with flat roofs and cornices and raised platforms called "stoeps" in front; but these are rapidly giving place to edifices of more modern design. Besides the castle, which is now useless in a military point of view, being commanded by the surrounding heights, the public buildings include the Government House (a modernized Dutch building), the supreme courts, the art gallery, the exchange, the post-office, and the public library (with upwards of 10,000 volumes) and museum, inaugurated in 1860, perhaps the finest edifice in the city. New parliament houses are being built on a magnificent scale, the legislature having voted a large sum for this purpose. Cape Town is the seat of bishops of the Anglican and Roman churches. Among its ecclesiastical buildings the Roman Catholic cathedral, a Gothic structure, is the most conspicuous. A university has been erected, and there are several educational institutions. The botanical gardens, in the centre of the town, serve the purposes of a park,

Cape of Good Hope.

and have been of great value in the introduction to the colony of many trees, flowering plants, and fruits.

The town is a municipality governed by a mayor and council. Its population, amounting in 1875 to nearly 33,000, is formed of many races; people of Dutch descent are still more numerous than British, but all European nations are represented. The "coolie" or labouring population comprises the descendants of negro slaves, and half-bred Hottentots and Kaffres; the Malays form a numerous class.

Cape Town is the starting-point of the Great Western Railway, which at present reaches Wellington, and is being extended towards Beaufort; and from the town communications are maintained by post, cart, or waggon, with all chief points in the interior. Besides being a market for home produce, Cape Town imports manufactured articles for the greater part of the western provinces, and has a large export trade in copper, wool, wine, fish, and fruit; the construction of a breakwater and docks in Table Bay having rendered shipping more secure and facilitated traffic. Several lines of steamers maintain regular communication with Cape Town both from Europe and from India, passing along the eastern and western sides of the continent.

The scenery round the head of Table Bay is very striking. Table Mountain, with its branches the Devil's Peak and Lion's Head, rises in a massive wall immediately at the back of Cape Town. During the prevalence of south-east winds it is covered by a dense whitish cloud, partially overlapping its side like a table-cloth. Along the base of this mountain, where lie the suburban villages of Rondebosch, Claremont, Wynberg, and Constantia, the land is covered with luxuriant vegetation, including oaks and firs, with gardens of flowers and shrubs (especially of heaths) and vineyards, and is studded with villas.

The Royal Observatory of the Cape, established in 1820—one of the most valuable of those supported by the British Government—is three miles east of Cape Town.

See Cape of Good Hope Blue Books; H. Hall, *South African Geography*; J. Fleming, *Southern Africa*; *Handbook for South Africa*; Glanville, *Guide to South Africa*; Noble, *Descriptive Handbook of Cape Colony*. (K. J.).

CAPE HAITIEN, or CAP HAITIEN, a town on the north coast of the island of San Domingo in the republic of Hayti, about $19^{\circ} 46' N.$ lat. and $72^{\circ} 14' W.$ long. Its original Indian name was Guarico; and it has also been known at various times as Cabo Santo, Cap Français, and Cape Henry, while it is familiarly designated as simply Le Cap. It is situated at the foot of a fine range of mountains on a small bay, and possesses a secure and commodious harbour. Its trade is principally with the United States. It has declined considerably from the flourishing condition to which it attained during the French supremacy, when it was the seat of an archbishop, and possessed a university and academies of music and painting, but it is still one of the chief towns of the republic, and is the seat of a civil and criminal court and a tribunal of commerce. It was originally founded by Spaniards from the island of Tortuga, and possesses an eventful history. In 1695 it was burnt by the English; and shortly after the revocation of edict of Nantes it received a French colony. In 1791 it was captured and burnt by Toussaint L'Ouverture; and in almost all the revolutions of the island since that date it has suffered severely. In 1842 it was almost destroyed by an earthquake. The troops of Salnave, who were in possession in 1865, having insulted the British flag, Captain Wake

bombarded the town and blew up the arsenal. In 1869 the followers of Saget made themselves masters of the place. The population at present is estimated at 12,000; but in last century it is said to have exceeded 38,000.

CAPE VERD ISLANDS. This group, situated in the Northern Atlantic Ocean, between the parallels of $14^{\circ} 20'$ and $17^{\circ} 20' N.$ lat., and $22^{\circ} 20'$ and $25^{\circ} 30' W.$ long., consists of ten islands, viz.:—Sant' Antao (commonly miswritten St Antonio), São Vicente, Santa Luzia, São Nicolao, Sal, Boa Vista, Maio, San Thiago (the St Jago of the English), Fogo, and Brava, besides a few uninhabited islets. They form a sort of broken crescent, with the concavity towards the west. The last four constitute the leeward (Sotoreuto) group and the other six the windward (Barlavento). The distance between the coast of Africa and the nearest island (Boa Vista) is about 200 miles. Their total area is estimated at 1240 square geographical miles. They belong to Portugal, and derive their name (*Ilhas do Cabo Verde*), frequently but erroneously written Cape de Verd Islands, from the African promontory off which they lie, known as Cape Verd, or the Green Cape. The archipelago was partially discovered in 1441 by an expedition fitted out by Dom Henrique of Portugal, under Antonio and Bartolomeo di Nolli; but no settlement was made on the islands till after the voyage of Cada Mosto in 1456.

It is most probable that the islands were uninhabited at the period of the Portuguese discovery. The new settlers, however, imported negroes from the African coast. The population now amounts to upwards of 70,000, and would have been much greater if famine, caused by droughts and epidemics, had not frequently diminished it. The blacks and mulattoes far outnumber the whites, whose constitution is less suited to the climate. Slavery existed in the islands in full force until the Portuguese Government set free the public slaves in 1854, and modified the condition of those who belonged to private individuals. At that time the number of persons subjected to "involuntary servitude" amounted to about 6000, but at the census of 1860 they had been reduced to 3979. Criminals are transported thither from the mother country, and the punishment is much dreaded. All the towns are poor, dirty places; even the best have few tolerable houses. The people are mild and hospitable, but indolent and uncleanly. In religion they are Roman Catholics. They are extremely ignorant and superstitious, and many heathen notions and practices prevail among them, brought from the African coast. All the inhabited islands have churches, except S. Luzia. The language is a bastard Portuguese, known to the people of the mother country as *lingua creoula*.

The archipelago forms one of the foreign provinces of Portugal, and is under the command of a governor-in-chief appointed by the Crown. There are two principal judges, one for the windward and another for the leeward group, the former with his residence at S. Nicolao, and the latter at Praia; and each island has a military commandant, a few soldiers, and a number of salaried officials, such as police, magistrates, and custom-house directors. There is also an ecclesiastical establishment, with a bishop, dean, and canons. In every island there is a primary Government school conducted by the priests, but the attendance is very small, and the children of the wealthier inhabitants are sent to Lisbon for their education. There are no roads in the islands, and ponies and donkeys are the beasts of burden.

Climate and Meteorology.—The atmosphere in the vicinity of these islands is generally hazy, especially in the direction of the continent. With occasional exceptions during summer and autumn, the north-east trade is the prevailing wind, blowing most strongly from November to May. The rainy season is during the months of August, September, and October, when there is thunder and a light variable wind from south-east or south-west, which is principally due to the close approach of the inner margin of the north-east trade winds, and the in-draught to the neighbouring continent, occasioned by the rarification of the air over the Sahara. The Harmattan, a very dry east wind from the African continent, occasionally makes itself felt. The heat of summer is high, the thermometer ranging from 80° to 90° Fahr. near the sea. The unhealthy season is the period during and following the rains, when vegetation springs up with surprising rapidity, and there is much stagnant water, poisoning the air on the lower grounds. Remittent fevers are then common. The people of all the islands are also subject in May to an endemic of a bilious nature called locally *levadiva*, but the cases rarely assume a dangerous form, and recovery is usually attained in three or four days without medical aid. The droughts already spoken of are sometimes general, sometimes partial. On some of the islands rain has occasionally not fallen for three years. The immediate consequence is a failure of the crops, and this is followed by the death of great numbers from sheer starvation. To add to these horrors, epidemics usually break out afterwards. These disastrous occurrences have greatly obstructed the progress of the colonies. In the general famine of 1730–3, about two-

thirds of the population perished, and in that which began in 1831–3, 30,000 persons are supposed to have perished. The years 1855 and 1856 were also marked by great distress in several of the islands.

Productions, Agriculture, &c.—The chief occupation of the islanders is cattle-feeding. In some of the islands the making of salt from sea-water employs a considerable number of persons. Orchil is gathered, and the indigo and castor-oil plants, as well as the physic-nut plant (*Cureas purgans*), are cultivated. The fruit of the last is exported in large quantities to Portugal, where the oil is expressed and consumed in lamps. Maize, sugar-cane, and the manioc plant are also much cultivated, as well as cotton and tobacco to a limited extent. Coffee was introduced in 1790, and grows well. Though the soil and climate are fitted to produce many tropical fruits, these receive little attention. Cocoa-nut trees, date-palms, tamarinds, and bananas are seen on most of the islands. Pumpkins, sweet potatoes, and the *kalo* are generally cultivated. Wood, except in the interior of S. Antao, is entirely wanting, and the people are often reduced to great straits for firing.

Quails are found in all the islands; rabbits in Bôa Vista, and in San Thiago and Fogo. Goats and asses are reared, and the skins of the former are exported. The neighbouring sea abounds with fish, and the coral animal is at work building up dangerous reefs on submerged rocks. Turtles come from the African coast to lay their eggs on the sandy shores.

The exports consist chiefly of coral, salt, physic-nuts, hides, coffee, maize, kidney-beans, sugar-cane spirit, and coarse sugar. The imports are cotton cloths, timber, hardware, crockery, glass, and wine. There is a considerable intercourse in the way of exchange between the islands one with another. There is a British consul stationed at Porto Grande in S. Vicente, and a vice-consul at Porto Sal Rey in Bôa Vista. On none of the islands have any lighthouses as yet been erected.

Botany.—The flora of these islands has been described by Mr P. Barker Webb in his *Spicilegia Gorgonea*, a catalogue of all the plants then discovered in the Cape Verd Islands, which forms part of Hooker's *Niger Flora*, London, 1849; also by Dr J. A. Schmidt in his *Beiträge zur Flora der Cap-Verdischen Inseln*, Heidelberg, 1852. From these works it appears that the total number of wild flowering plants amounted to 424, of which 77 are monocotyledonous, and 347 dicotyledonous. Of the former an asparagus and 14 grasses are peculiar; and of the latter, 50 are peculiar. There are besides 14 ferns, two of which are peculiar. The flora is closely related in the main to that of the neighbouring continent, and is strongly impressed with a tropical character. Doubtless a large proportion of the plants have been introduced.

Geology.—The whole archipelago is of volcanic origin, but little is known of its geological structure. Mr Darwin's examination of San Thiago (St Jago) appears to be the fullest that has been made of any of the islands, and that was only partial. Marine shells are found embedded in tufa at Bôa Vista (as we learn from Bowdich, who visited that island in 1823), showing an upheaval to some extent. In Fogo is a still active volcano several thousand feet high, which merits the investigation of geologists; and indeed all the islands would, doubtless, repay the student of volcanic phenomena for the time and labour bestowed on their examination. For instance, an inquiry into the circumstances under which calcareous sand is thrown upon the island of Bôa Vista, and heaped up by the winds into hills 30 feet high, would probably tend to explain the origin of the superficial layer of similar sand in part of Madeira and Porto Santo.

S. Antao, the most north-westerly of the group, has an area of 240 square geographical miles, and a population of about 29,600. Its surface is very rugged, and the interior lofty. The Sugar Loaf, its highest mountain, is thought to reach the altitude of 5900 feet. This island is reputed to be at once the most picturesque, the healthiest, the best watered, and the most fertile of the archipelago. On the other hand, the difficulty of passing from one part to another is very great. There are three indifferent landing-places, of which the most frequented is Ponta do Sol, where the custom-house stands, distant more than a league from the chief town, Ribeira Grande, situated in the north-west of the island, a place of about 7000 inhabitants. Tarrafal Bay is spacious, and is sheltered from the prevalent winds. The island produces good coffee and sugar, and abundance of fruit; but the people are reputed to be indolent and inattentive to the advantages which soil and water afford them. Lead is said to be obtained, and there is a current opinion that other metals exist. Somewhere on the island is an extinct crater, from which the people declare that a wind occasionally issues so strong as to blow back any object that may be cast into the hollow.

S. Vicente (St. Vincent) lies adjacent to *S. Antao* on the east. It has a superficies of 70 square miles, and a population of about 1700. At Ponta Grande, on the north-west coast, is an extensive and excellent harbour, with a coaling station for British steamers; and barracks and municipal buildings are in course of erection. The island is so exposed to the fury of the north-east winds that not a tree will flourish. Its soil yields very little, and the inhabitants are supplied with grain and fruit from *S. Antao*. The distance from *S. Vicente* to *S. Antao* is about 5 miles, to *S. Luzia* about 4 miles.

Santa Luzia is a small island between *S. Vicente* and *S. Nicolao*, with an area of about 18 square miles. The inhabitants, who are wholly occupied in attending to their cattle, do not exceed a dozen. Much orechil was formerly gathered. A little to the south are the two uninhabited islands of *Bruma* and *Rosa*.

S. Nicolao is a long narrow island of a crescentic shape, with an area of about 115 square geographical miles, and a population of about 6000 persons. The climate is not very healthy. Maize, kidney-beans, manioc, sugar-cane, and vines are cultivated; and in ordinary years grain is exported to the other islands. The interior is mountainous, and has two remarkable hills which can be seen for many leagues; one has the shape of a sugar-loaf, and is near the middle of the island; the other, Monte Gordo, is near the west end, and has a height of 4200 feet. All the other islands of the group can be seen from *S. Nicolao* in clear weather. Vessels frequently enter Freshwater Bay, near the south-east extremity of the island, for water and fresh provisions; and the custom-house is here. The bishop of the archipelago has his headquarters in the island, and there is also a seminary for priests. The distance from *S. Nicolao* to *S. Vicente* is over 20 miles, to *S. Luzia* nearly 60 miles.

Sil, a narrow island, through whose centre passes the meridian of 23°, has a length of 20 miles, an area of 70 square geographical miles, and a population of about 750 persons, one-third of whom are employed in the manufacture of salt, of which about 15,000 tons are manufactured in favourable years. The name is derived from a natural salt-spring, at which the trade commenced; but this has now been abandoned for artificial salinas more conveniently situated. A space of nearly 20 miles intervenes between *Sil* and *Bon Vista*.

Bon Vista, the most easterly island of the group, lies in lat. 16° 5' N. and long. 22° 35' W. Its length from east to west is about 17 miles, and its breadth from north to south is about 16 miles. Its coast is indented by numerous shallow bays, the largest of which, situated on the western side, serves as a road for shipping. A chain of heights traverses the middle of the island, and there are inferior hilly ranges on each side: the loftiest peak attains the altitude of 1360 feet. All the hills have basaltic summits. The plateau from which the hills rise has a height of about 60 feet above the sea, and is composed chiefly of calcareous sandstone. Near Ponta Sal Rey are ruins containing abundance of marine remains: and near the same place is a raised beach containing shells, &c. The superficial calcareous sandstone also abounds in shells. In the north-western angle of the island there is a low tract covered with loose sand, which is blown about by the winds, to the great annoyance of the inhabitants. This part is inundated with water during the rainy season; and here are some extensive salt-pans, where the sea-water is evaporated by the heat of the sun. The inhabitants number about 5900, and the island is in great part uncultivated. Horned cattle and goats are tolerably numerous. Salt and orechil are exported. With the exception of a few cocoa-nut trees, there is no wood; and in the dry season the island offers to the eye nothing but an arid waste. The little vegetation that then exists is in the bottom of ravines, where corn, beans, and cotton are cultivated. The springs of good water are few. Ponta Sal Rey, on the western side of the island, is the chief town (population about 1600); and there are several villages scattered about the island. Remittent fevers are common during and after the rainy season, and diarrhoea, pectoral complaints, and ophthalmia occasionally occur. A good deal of fish is taken on the coast, and supplies the impoverished islands with much of their food. Towards the end of 1845 yellow fever broke out

in the island, and carried off about a fourteenth of the population. About the beginning of the century there resided on this island a certain Senhor Manoel Martins, who had great influence and power. He it was who constructed the salt-works in *Sil*, and laid down there the first iron railway that the Portuguese dominions possessed, for the purpose of conveying the salt from the salinas to the shore.

Maio has a length of 15 miles, and its area is about 50 square geographical miles. The inhabitants, who number 773, derive their support chiefly from their cattle and from the exportation of salt. Fish is abundant. This island is a most fertile waste, surrounded by dangerous rocks. The best landing-place is at English Road, on the west side. *Maio* is 25 miles from *Bon Vista*, and is separated from *San Thiago* by a channel 7 miles wide.

San Thiago (St. John), the largest but also the most unhealthy island of the archipelago, has a length of 37 miles, an area of 600 square geographical miles, and a population of 32,600 persons. Its geological structure is volcanic, and part of it has been minutely described by Mr. Darwin in his *Observations on Volcanic Islands*, 1845. Its interior is very hilly, the highest point being a pointed central mountain called Pico do Antonio, which attains the altitude of 4500 feet. There are numerous ravines which bring down perennial streams, and in these ravines there is a good deal of cultivated ground, where crops of sugar-cane, maize, kidney-beans, rice, and manioc are raised. Some of the produce is exported to the other islands. Spirit is distilled from the juice of the sugar-cane, and a coarse superabundant. The purest very high-quality rum is largely grown, and in 1839 the crop amounted to no less than 15,750 hogshead. Fine specimens of the Lushan may also be seen. The chief port is at Villa da Praia, a town at the southern extremity of the island, with 2000 inhabitants. At this place, called Porto Praya by the English, the former general head-quarters were. Before the establishment of the coal depot for British steamers at *S. Vicente*, it was better known to voyagers than any other town in the group. It stands on a fertile plain overlooking the bay, and presents an unobscured appearance, with its numerous coconut trees, and the lofty peak of Antonio rising from behind some steep steps of hills in the background. The streets are wide and well laid out, and there is a large square in the heart of the town. The neighbourhood has a delicate aspect from its utter sterility. On the west a range of hills penetrates several miles into the interior, but does not afford secure shelter. In the ravine, at its base, is the town of Ribeira Grande, the former capital of the island, which, with its ruined fort and cathedral, has a picturesque appearance.

Fogo—This island is 50 miles distant from *San Thiago*, and lies between the parallels of 14° 42' and 15° 1' N. lat., and 24° 5' and 24° 32' W. long. It measures about 12 leagues from N. to S., and about 14 leagues from E. to W. Its area is estimated at 144 square geographical miles. Through the middle runs a mountain ridge of a semicircular form, the convexity being towards the east, and about the centre there rises a volcanic cone to the height of 9150 feet. This volcano produced fire uninterruptedly from 1699 to 1713. It has been active several times since then, the last eruptions having taken place in 1837, when a current of lava flowed to the sea; the summit still emits vapour. In one part of the island there are a number of extinct craters where much sulphur could be collected. The only anchorage for vessels of burden is in Luz Bay, on the west side. Deep ravines add to the inequalities of the island, and carry off the rain as soon as it falls. The inhabitants, with great want of foresight, have been in the habit of felling trees, without replanting, so that very few trees are now to be found. The water is good but not abundant. The population amounts to about 3100. São Felipe, the largest town, and the only place with any commerce, has a population of about 1000. The chief articles of produce are sugar-cane, ground nuts, sweet potatoes, and cassava. There are few goats and swine, but horned cattle are abundant. This island is reputed to be one of the healthiest of the group; but in addition to the usual endemic, remittent and intermittent fevers manifest themselves in October and November, the intensity of which is in proportion to the abundance of the rains. In July 1835 there was an outbreak of cholera, which attacked upwards of a fourth of the entire population, and carried off nearly 650 persons.

Brava, the most southerly of the group, has an area of 36 square geographical miles, and its population amounts to nearly 7500, so that it is the most densely populated of all. Its distance from *Fogo* is about 12 miles. The interior is mountainous, but near the coast the soil is comparatively fertile; its agricultural productions are numerous, and much maize is exported. Whalers resort to this island for supplies, and by their means the scanty resources of the population are eked out. This island is usually covered with dense clouds, otherwise its high land would be seen from a great distance.

C. de Chelmicki and T. A. de Varnhagen, *Cronographia Cabo-Verdiana*, Lisbon, 1841-2; Charles Darwin, *Geological Observations on Volcanic Islands*, London, 1844; J. J. Lima, *Enchiridion sobre a Estatística da possessões Portuguezas na Africa occidental e oriental*, Lisbon, 1844.

CAPEFIGUE, BAPTISTE HONORÉ RAYMOND (1801–1872), a French historian and biographer, was born at Marseilles in 1801. At the age of twenty he left his native town in order to study law at Paris; but he soon deserted law for journalism. He became editor of the *Quotidienne*, and was afterwards connected, either as editor or leading contributor, with the *Temps*, the *Messager des Chambres*, the *Revolution de 1848*, and other papers. During the ascendancy of the Bourbons he held a post in the Foreign Office, for which he was indebted to the royalism of some of his newspaper articles. Indeed all Capefigue's works receive their colour from his legitimist politics; he preaches divine right and non-resistance, and finds politico words for even the profligacy of Louis XV. and the worthlessness of his mistresses. His style bears evident marks of haste, and although he had access to an exceptionally large number of sources of information, including the state papers, inaccuracies are not infrequent. This is not surprising when we consider the astonishing number of his biographies and histories. The former include the lives of Catherine and Maria de' Medici, Anne and Maria Theresa of Austria, Catherine II. of Russia, Elizabeth of England, Diana of Poitiers, and Agnes Sorel. The latter, besides histories of the Jews from the fall of the Maccabees to the author's time, of the first four centuries of the Christian church, and of European diplomatists, extend over the whole range of French history. As among the most important, and as illustrative of the extent of the field which he traversed, mention may be made of his histories of the Norman invasions, of the kings from Hugh Capet to Philip Augustus, of the constitution from Louis VIII. to Louis XI., of the Reformation and the League, of Louis XIV. and XV., of the restoration of the Bourbons, of the consulate and the empire, and of Louis XVI. He died at Paris in December 1872.

CAPEL, ARTHUR, LORD (c. 1600–1649), was the son of Sir Henry Capel. His birth year is not accurately known; but it was about 1600. In 1640 he was chosen to represent the county of Hertford, and sat as a member of the Long Parliament, which was convened that year. He was elevated to the peerage by Charles I.; and on the breaking out of the revolutionary war he raised and maintained a troop in the royal interest, till the final triumph of the Parliamentarians compelled him to make peace with them. During the war he acted, together with Edward Hyde and Lord Colchester, as general in the west, and was concerned in important engagements at Bristol, Exeter, and Taunton. Having with noble devotion reassembled his troop in order to effect the rescue of Charles, he was forced by famine and sedition to surrender at Colchester to General Fairfax, and was condemned by the Commons to be banished; but on the authority of some of the Parliamentary leaders he was immediately committed to the Tower. He contrived to effect his escape from prison, but was apprehended at Lambeth, and again committed to stand his trial at Westminster for treason. He was condemned to death, and was executed on the 9th of March 1649, exhibiting on the scaffold the greatest calmness and dignity. He was the author of *Daily Observations or Meditations*, a posthumous publication, which was afterwards reprinted under a different title, with an account of his life.

CAPELL, EDWARD (1713–1781), a well-known critic and annotator of Shakespeare, was born at Troston in Suffolk in 1713. Through the influence of the duke of Grafton he was early appointed to the office of deputy-inspector of plays, with a salary of £200 per annum. Shocked at the inaccuracies which had crept into Sir Thomas Hammer's edition of Shakespeare, he projected an entirely new edition, to be carefully collated with the original copies. After spending three years in collecting

and comparing a vast number of scarce folio and quarto editions, he published his own edition in 10 vols. 8vo, with an introduction, written in a style of extraordinary quaintness, which was afterwards appended to the prolegomena of Johnson's and Steevens's editions. The work was published at the expense of the principal booksellers of London, who gave him £300 for his labour. Three other volumes of *Notes and Various Readings of Shakespeare*, which he had announced in his introduction, under the title of *The School of Shakespeare*, were published under the editorial superintendence of Mr Collins, in 1783, two years after Capell's death. They contain the results of his unremitting labour for thirty years in collating the ancient MSS., and though utterly wanting in literary taste, throw considerable light on the history of the times of Shakespeare, as well as on the sources from which he derived his plots. Besides the works already specified, he published a volume of ancient poems called *Prologues*, and an edition of *Antony and Cleopatra* adapted for the stage.

CAPELLA, MARTIANUS MINNEUS FELIX, author of a enormous encyclopædic work on the liberal arts, was born in the north of Africa, and flourished probably towards the beginning of the 5th century A.D., or at least during the 4th century. There is, however, no direct evidence as to the exact epoch at which he lived, and the few references to the author contained in the work itself are not sufficiently definite to admit of any certain conclusion being drawn. He appears to have been a solicitor by profession and in easy circumstances. His work, entitled *Satyra de Nuptiis Philologie et Mercurii*, is an elaborate allegory in nine books, written in a mixture of prose and verse. The style is heavy and involved, loaded with metaphor and bizarre expressions, and verbose to excess. The first two books contain the allegory proper,—the marriage of Mercury to a nymph named Philologia. It is wrought out in great detail, but the original conception is not a happy one, and the execution is tasteless. The remaining seven books contain expositions of the seven liberal arts, which then comprehended all human knowledge. Book iii. treats of grammar, iv. of dialectics, v. of rhetoric, vi. of geometry, vii. of arithmetic, viii. of astronomy, ix. of music. These abstract discussions are linked on to the original allegory by the device of personifying each science as a courtier of Mercury and Philologia. The work was a complete encyclopædia of the liberal culture of the time, and it was in high repute during the Middle Ages. There is much interesting matter in it, and much erudition is displayed by the author, but the whole is executed in a clumsy, pedantic, and tasteless fashion.

A passage in book viii. has always attracted the attention of commentators, for it contains a very clear statement of the heliocentric system of astronomy. Many have supposed that Copernicus, who quotes Capella, may have received from this work some hints towards his own new system.

The *editio princeps* of Capella is that by Bodianus, 1449; the best of the older editions is that by Grotius, 1599; modern editions are those of Kopp, 1836, and Eyssenhardt, 1866. Eyssenhardt, in various contributions to the *Rheinisches Museum*, has done much for the text and explanation of Capella.

CAPERCALLY, or CAPERKALLY,—to use the spelling of the old law-books¹, as given by Pennant, the zoologist, who, on something more than mere report, first included this bird among the British Fauna,—a word commonly derived from the Gaelic *Capull*, a horse (or, more properly, a mare), and *Coille*, a wood, but with greater likelihood, according to the opinion of Dr McLauchlan, from *Cabher*

¹ The only one of the "Seots Aets," however, in which the writer has been able to ascertain that the bird is named is No. 30 of James VI. (1621), which was passed to protect "powties, partrikes, moore: fowles, blakeocks, gray hennis, termigantis, quailzies, capercallies," &c.

an old man (and, by metaphor, an old bird), and *Coille*, the name of *Tetrao urogallus*, the largest of the grouse family (*Tetraonidae*), and a species which was formerly indigenous to Scotland and Ireland. The word is frequently spelt otherwise, as *Caperealze*, *Capereailzie* (the *z*, a letter unknown in Gaelic, being pronounced like *y*), and *Capercaillic*, and the English name of Wood-Grouse or Cock-of-the-wood has been often applied to the same bird. The earliest notice of it as an inhabitant of North Britain seems to be by Hector Boethius, whose works were published in 1526, and it can then be traced through various Scottish writers, to whom however it was evidently but little known, for about 200 years, or may be more, and by one of them only, Bishop Lesly in 1578, was a definite *habitat* assigned to it:—"In Rossia quoque Longuhabria [Lochaber], atque aliis montanis locis" (*De Origine Moribus de rebus gestis Scotorum*. Romæ: ed. 1675, p. 24). Pennant, during one of his tours in Scotland, found that it was then (1769) still to be met with in Glen Moriston and in the Chisholm's country, whence he saw a cock-bird. We may infer that it became extinct about that time, since Mr Gray (*Birds of the West of Scotland*, p. 229) quotes the Rev. John Grant as writing in 1794:—"The last seen in Scotland was in the woods of Strathglass about thirty-two years ago." Of its existence in Ireland we have scarcely more details. If we may credit the *Pavones sylvestres* of Giraldus Cambrensis with being of this species, it was once abundant there, and Willughby (1678) was told that it was known in that kingdom as the "Cock-of-the-wood." A few other writers mention it by the same name, and Ruttie, in 1772, says (*Nat. Hist. Dublin*, i. p. 302) that "one was seen in the county of Leitrim about the year 1710, but they have entirely disappeared of late, by reason of the destruction of our woods." Pennant also states that about 1760 a few were to be found about Thomastown in Tipperary, but no later evidence is forthcoming, and thus it would seem that the species was exterminated at nearly the same period both in Ireland and Scotland.

When the practice of planting was introduced, the restoration of this fine bird to both countries was attempted. In Ireland the trial, of which some particulars are given by Thompson (*Birds of Ireland*, ii. p. 32), was made at Glengarriff, but it seems to have utterly failed, whereas in Scotland, where it was begun at Taymouth, it finally succeeded, and the species is now not only firmly established, but is increasing in numbers and range. The late Mr Lloyd, author of several excellent works on the wild sports and natural history of Scandinavia, supplied the stock from Sweden, but it must be always borne in mind that the original British race was wholly extinct, and no remains of it are known to exist in any museum.

This species is widely, though intermittently, distributed on the continent of Europe, from Lapland to the northern parts of Spain, Italy, and Greece, but is always restricted to pine-forests, which alone afford it food in winter. Its bones have been found in the kitchen-middens of Denmark, proving that country to have once been clothed with woods of that kind. More lately its remains have been recognized from the caves of Aquitaine. Its eastern or southern limits in Asia cannot be precisely given, but it certainly inhabits the forests of a great part of Siberia. On the Stanovoi Mountains, however, it is replaced by a distinct though nearly allied species, the *T. urogalloides* of Dr von Middendorff¹ which is smaller with a slenderer bill but longer tail.

The Cock-of-the-wood is remarkable for his large size and

glossy-black plumage. He is polygamous, and in spring mounts to the topmost bough of a tall tree, whence he challenges all comers by extraordinary sounds and gestures; while the hens, which are much smaller and mottled in colour, timidly abide below the result of the frequent duels, patiently submitting themselves to the victor. While this is going on it is the practice in many countries, though generally in defiance of the law, for the so-called sportsman stealthily to draw nigh, and with well-aimed rifle to murder the principal performer in the scene. The hen makes an artless nest on the ground, and lays therein from seven to nine or even more eggs. The young are able to fly soon after they are hatched, and towards the end of summer and beginning of autumn, from feeding on the fruit and leaves of the bilberries and other similar plants, which form the undercover of the forests, get into excellent condition and become good eating. With the first heavy falls of snow they betake themselves to the trees, and then, feeding on the pine-leaves, their flesh speedily acquires so strong a flavour of turpentine as to be distasteful to most palates. The usual method of pursuing this species on the Continent is by encouraging a trained dog to range the forest and spring the birds, which then perch on the trees; while he is baying at the foot their attention is so much attracted by him that they permit the near approach of his master, who thus obtains a more or less easy shot. A considerable number, however, are also snared. Hybrids are very frequently produced between the Capercailly and the Black Grouse (*T. tetrix*), and the offspring has been described by some authors under the name of *T. medius*, as though a distinct species. (A. S.)

CAPERNAUM (Καπερναούμ, that is, probably, the village of Nachum), an ancient city of Palestine, on the western shore of the Lake of Genesareth, on the borders of the tribes of Zebulun and Naphtali. It was, more than any other place, the residence of Jesus after He commenced His mission, and thus became the scene of many of His most important miracles; but the infidelity of the inhabitants brought down upon them the heavy denunciation:—"And thou, Capernaum, which art exalted unto heaven, shalt be brought down to hell." The site of the city is a matter of much dispute,—one party, headed by Dr Robinson, maintaining an identification with Khan Minyeh, and another, represented by Wilson, Ritter, and Thomson, supporting the claims of Tell Hum. Khan Minyeh is situated in a "fertile plain formed by the retreat of the mountains about the middle of the western shore." The ruins, according to J. L. Porter, extend over a space of several acres; and in the neighbourhood is a water-source, Ain et-Tin, "the fountain of the fig-tree," which may correspond with the fountain of Capernaum mentioned by Josephus. Tell Hum lies about three miles north of Khan Minyeh, and its ruins, covering an area of "half a mile long by a quarter wide," prove it to have been the site of no small town. The satisfactory decision of the question can only be arrived at by more elaborate researches.

CAPERS, the unexpanded flower-buds of *Capparis spinosa*, prepared with vinegar for use as a pickle, which is much esteemed. The caper plant is a trailing shrub, belonging to the Mediterranean region, resembling in habit the common bramble, and having handsome flowers of a pinkish white, with four petals, and numerous long tassel-like stamens. The leaves are simple and ovate, with spiny stipules. The plant is cultivated in Sicily and the South of France; and in commerce, capers are valued according to the period at which the buds are gathered and preserved. The finest are the young tender buds called "nonpareil," after which, gradually increasing in size and lessening in value, come "superfine," "fine," "capucin," and "capot." They possess valuable stimulant, acrid, and anti-scorbutic

¹ Not to be confounded with the bird so named previously by Prof. Nilsson, which is an hybrid.

properties similar to the *Cruciferae*. Other species of *Capparis* are similarly employed in various localities, and in some cases the fruit is pickled.

CAPET, the name of a family, to which, for nearly nine centuries, belonged the kings of France and many of the rulers of the most powerful fiefs in that country, and which mingled with several of the other royal races of Europe.

The first of the Capets known in history was Robert the Strong, a Saxon who received from Charles the Bald the county of Anjou, and, later, in 861, the duchy of the Ile de France, and who gained popularity by his repulse of the marauding Normans. The most distinguished of his successors were Eudes, Robert, Rudolph, who succeeded to the dukedom of Burgundy in 888, 922, and 923 respectively, and Hugh the Great, count of Paris and Orleans, duke of France and Burgundy, who held vast domains from the Loire to the frontiers of Picardy. His son, Hugh Capet (987-996), being supported by the Normans and by his brother, the duke of Burgundy, was, in 987, elected king by acclamation, and crowned at Rheims, in place of the Carolingians, who were hated for their German manners and their desire to reconstruct the empire. The Capets, on the contrary, for some time avoided all such pretensions, and carefully maintained friendship with the church and the nobles, among whom they claimed to be no more than *primi inter pares*, and over whom they scarcely attempted to exert the slightest authority. By following this policy, they firmly established themselves on the throne, the influence of which they greatly extended by marriages, treaties, and conquests, and which the family continued to hold, after the failure of the direct royal line, at the death of Charles IV. in 1322, by the accession of the indirect lines of Valois, which reigned from 1322 to 1589, and of Bourbon, the last monarchical dynasty of France (see FRANCE).

The royal house of Valois was founded by Philip VI., son of Charles de Valois, second son of Philip III. (see VALOIS); and the house of Bourbon (whose family name was Capet) was connected with the Capets by the marriage, in 1272, of Robert, the sixth son of Louis IX., to Beatrice, the sole heiress of Agnes of Bourbon and the duke of Burgundy (see BOURBON).

Scarcely second in importance to the royal house is the branch to which belonged the dukes of Burgundy. In the 10th century Burgundy fell into the hands of Hugh the Great, father of Hugh Capet, who gave it, in 956, to his son Otto, and in 965 to his son Henry. In 1032 the second son of Robert the Pious, and grandson of Hugh Capet, founded the first ducal house, which ruled till 1361. For two years the duchy was in the hands of the Crown, but in 1363, the second ducal house, also Capetian, was founded by Philip the Bold, son of king John (see BURGUNDY). This branch of the Capets is also distinguished by its union with the royal house of Austria, through the marriage of Mary, daughter of Charles the Bold of Burgundy, to Maximilian, the archduke.

Of great importance also was the house of Anjou, which was founded by Charles, brother of Louis IX., Anjou having been ceded, with other provinces, by John of England to Philip Augustus, the grandfather of Charles. For an account of the counts and dukes of Anjou see ANJOU. Members of this family sat upon the thrones of three kingdoms. The counts of Anjou were also kings of Naples from 1226 to 1382; in 1309 Charles Robert of Anjou was elected king of Hungary, his claim being based upon the marriage of his ancestor with the daughter of Stephen IV. of Hungary; and, in 1445, Margaret, daughter of Duke René, married Henry VI. of England.

A third branch formed the house of Artois, which was founded, in 1226, by Robert the Illustrious, grandson

of Philip Augustus, who gained possession of Artois by his marriage with Isabella of Hainault. This house merged in that of Valois, in 1383, by the marriage of Margaret of Artois with Philip the Hardy.

The throne of Navarre was also filled by the Capets. In 1284 its heiress, Jane, became the wife of Philip the Fair of France, and the two kingdoms were united till Philip of Valois ascended the French throne, when its queen, Jane, daughter of Louis X., married (1328) into the house of Evreux (see NAVARRE).

In the 13th century the throne of Constantinople was occupied by a branch of the Capets,—Pierre, eighth son of Louis VI., having obtained that dignity as brother-in-law of Baldwin count of Flanders (who was appointed emperor by the Crusaders in 1204) and of his successor Henry. Pierre was succeeded by his two sons, Robert and Baldwin de Courtenai, from the latter of whom Constantinople was recovered by the Greeks in 1261.

The counts of Dreux, for two centuries and a half (1132-1377), and the counts of Evreux, from 1307 to 1425, also belonged to the family of the Capets,—other members of which worthy of mention are the Dunois and the Longuevilles, illegitimate branches of the house of Valois, which produced many famous warriors and courtiers.

CAPGRAVE, JOHN (1393-1464), an English historian, was born at Lynn in Norfolk, 21st April 1393. At an early age he was sent to one of the English universities,—most probably Cambridge,—and at a later period of his life he was connected with both. In his twenty-fourth year he entered the priesthood, and subsequently he prosecuted his studies in London, where he was residing at the time of the birth of King Henry VI. At Oxford he graduated D.D., taught theology publicly in the schools, and lectured on the Old and New Testaments. Having become an Augustinian friar he settled down in the house belonging to that order in his native town, where, to quote Leland's expression, he "stuck to his books like a limpet to its rock." The friary at Lynn was then a flourishing establishment. It possessed a large and valuable library, and afforded a home to no fewer than thirty priests, besides subdeacons and novices to the number of sixteen. It is highly probable that Capgrave became prior of this house, and it is certain that he was chosen provincial of his order in England. Most of his life was spent in the retirement of the cloister at Lynn, but he occasionally visited other Augustinian friaries, and once, at least, went to Rome. He died at Lynn 12th August 1464. Capgrave was justly regarded as one of the most learned men of his age. His works are chiefly theological, consisting of commentaries, sermons, and biographies of saints. To the last class belongs the *Nova Legenda Angliæ*, printed in London by Wynkyn de Worde in 1516. Of his historical works the most important is *The Chronicle of England*, published in 1858 under the editorial supervision of the Rev. F. C. Hingeston, and forming one of the series of *Chronicles and Memorials of Great Britain and Ireland*. This "Chronicle," written in English, extends to the year 1417,—the accounts of the reigns of the later kings being very full and valuable, and containing many original notices. Mr Hingeston also edited in the same year and for the same series Capgrave's *Liber de Illustribus Henricis*, in the original Latin, accompanying it with an English translation in a separate volume. This curious work contains lives of King Henry VI. and other men of eminence who bore the name of Henry. Many other works by Capgrave are preserved in MS., including a *Life of St Katherine* in quaint English verse; but it is believed that his life of his patron and friend, Humphrey, duke of Gloucester, is irrecoverably lost.

CAPILLARY ACTION

A TUBE, the bore of which is so small that it will only admit a hair (*capilla*), is called a capillary tube. When such a tube of glass, open at both ends, is placed vertically with its lower end immersed in water, the water is observed to rise in the tube, and to stand within the tube at a higher level than the water outside. The action between the capillary tube and the water has been called Capillary Action, and the name has been extended to many other phenomena which have been found to depend on properties of liquids and solids similar to those which cause water to rise in capillary tubes.

The forces which are concerned in these phenomena are those which act between neighbouring parts of the same substance, and which are called forces of cohesion, and those which act between portions of matter of different kinds, which are called forces of adhesion. These forces are quite insensible between two portions of matter separated by any distance which we can directly measure. It is only when the distance becomes exceedingly small that these forces become perceptible. Quincke¹ has made experiments to determine the greatest distance at which the effect of these forces is sensible, and he finds for various substances distances about the twenty-thousandth part of a millimetre.

Poggendorff² tells us that Leonardo da Vinci³ must be considered as the discoverer of capillary phenomena.

The first accurate observations of the capillary action of tubes and glass plates were made by Hauksbee.⁴ He ascribes the action to an attraction between the glass and the liquid. He observed that the effect was the same in thick tubes as in thin, and concluded that only those particles of the glass which are very near the surface have any influence on the phenomenon.

Dr Jurin⁵ showed that the height at which the liquid is suspended depends on the section of the tube at the surface of the liquid, and is independent of the form of the lower part of the tube. He considered that the suspension of the liquid is due to "the attraction of the periphery or section of the surface of the tube to which the upper surface of the water is contiguous and coheres." From this he shows that the rise of the liquid in tubes of the same substance is inversely proportional to their radii.

Newton devotes the 31st query in the last edition of his *Opticks* to molecular forces, and instances several examples of the cohesion of liquids, such as the suspension of mercury in a barometer tube at more than double the height at which it usually stands. This arises from its adhesion to the tube, and the upper part of the mercury sustains a considerable tension, or negative pressure, without the separation of its parts. He considers the capillary phenomena to be of the same kind, but his explanation is not sufficiently explicit with respect to the nature and the limits of the action of the attractive force.

It is to be observed that, while these early speculators ascribe the phenomena to attraction, they do not distinctly assert that this attraction is sensible only at insensible distances, and that for all distances which we can directly measure the force is altogether insensible. The idea of such forces, however, had been distinctly formed by Newton, who gave the first example of the calculation of the effect of such forces in his theorem on the alteration of

the path of a light-corpuscule when it enters or leaves a dense body.

Clairaut⁶ appears to have been the first to show the necessity of taking account of the attraction between the parts of the fluid itself in order to explain the phenomena. He does not, however, recognize the fact that the distance at which the attraction is sensible is not only small but altogether insensible.

Segner⁷ introduced the very important idea of the surface-tension of liquids, which he ascribed to attractive forces, the sphere of whose action is so small "ut nullo adhuc sensu percipi potuerit." In attempting to calculate the effect of this surface-tension in determining the form of a drop of the liquid, Segner took account of the curvature of a meridian section of the drop, but neglected the effect of the curvature in a plane at right angles to this section.

But the idea of surface-tension introduced by Segner had a most important effect on the subsequent development of the theory. We may regard it as a physical fact established by experiment in the same way as the laws of the elasticity of solid bodies. We may investigate the forces which act between finite portions of a liquid in the same way as we investigate the forces which act between finite portions of a solid. The experiments on solids lead to certain laws of elasticity expressed in terms of coefficients, the values of which can be determined only by experiments on each particular substance. Various attempts have also been made to deduce these laws from particular hypotheses as to the action between the molecules of the elastic substance. We may therefore regard the theory of elasticity as consisting of two parts. The first part establishes the laws of the elasticity of a finite portion of the solid subjected to a homogeneous strain, and deduces from these laws the equations of the equilibrium and motion of a body subjected to any forces and displacements. The second part endeavours to deduce the facts of the elasticity of a finite portion of the substance from hypotheses as to the motion of its constituent molecules and the forces acting between them.

In like manner we may by experiment ascertain the general fact that the surface of a liquid is in a state of tension similar to that of a membrane stretched equally in all directions, and prove that this tension depends only on the nature and temperature of the liquid and not on its form, and from this as a secondary physical principle we may deduce all the phenomena of capillary action. This is one step of the investigation. The next step is to deduce this surface-tension from an hypothesis as to the molecular constitution of the liquid and of the bodies that surround it. The scientific importance of this step is to be measured by the degree of insight which it affords or promises into the molecular constitution of real bodies by the suggestion of experiments by which we may discriminate between rival molecular theories.

In 1756 Leidenfrost⁸ showed that a soap-bubble tends to contract, so that if the tube with which it was blown is left open the bubble will diminish in size and will expel through the tube the air which it contains. He attributed this force, however, not to any general property of the surfaces of liquids, but to the fatty part of the soap which he supposed to separate itself from the other constituents

of the solution, and to form a thin skin on the outer face of the bubble.

In 1787 Monge¹ asserted that "by supposing the adherence of the particles of a fluid to have a sensible effect only at the surface itself and in the direction of the surface it would be easy to determine the curvature of the surfaces of fluids in the neighbourhood of the solid boundaries which contain them; that these surfaces would be *lenticular* of which the tension, constant in all directions, would be everywhere equal to the adherence of two particles, and the phenomena of capillary tubes would then present nothing which could not be determined by analysis." He applied this principle of surface-tension to the explanation of the apparent attractions and repulsions between bodies floating on a liquid.

In 1802 Leslie² gave the first correct explanation of the rise of a liquid in a tube by considering the effect of the attraction of the solid on the very thin stratum of the liquid in contact with it. He does not, like the earlier speculators, suppose this attraction to act in an upward direction so as to support the fluid directly. He shows that the attraction is everywhere normal to the surface of the solid. The direct effect of the attraction is to increase the pressure of the stratum of the fluid in contact with the solid, so as to make it greater than the pressure in the interior of the fluid. The result of this pressure if unopposed is to cause this stratum to spread itself over the surface of the solid as a drop of water is observed to do when placed on a clean horizontal glass plate, and this even when gravity opposes the action, as when the drop is placed on the under surface of the plate. Hence a glass tube plunged into water would become wet all over were it not that the ascending liquid film carries up a quantity of other liquid which coheres to it, so that when it has ascended to a certain height the weight of the column balances the force by which the film spreads itself over the glass. This explanation of the action of the solid is equivalent to that by which Gauss afterwards supplied the defect of the theory of Laplace, except that, not being expressed in terms of mathematical symbols, it does not indicate the mathematical relation between the attraction of individual particles and the final result. Leslie's theory was afterwards treated according to Laplace's mathematical methods by James Ivory in the article on capillary action, under the heading "Fluids, Elevation of," in the supplement to the fourth edition of the *Encyclopædia Britannica*, published in 1819.

In 1804 Thomas Young³ founded the theory of capillary phenomena on the principle of surface-tension. He also observed the constancy of the angle of contact of a liquid surface with a solid, and showed how from these two principles to deduce the phenomena of capillary action. His essay contains the solution of a great number of cases, including most of those afterwards solved by Laplace, but his methods of demonstration, though always correct, and often extremely elegant, are sometimes rendered obscure by his scrupulous avoidance of mathematical symbols. Having applied the secondary principle of surface-tension to the various particular cases of capillary action, Young proceeds to deduce this surface-tension from ulterior principles. He supposes the particles to act on one another with two different kinds of forces, one of which, the attractive force of cohesion, extends to particles at a greater distance than those to which the repulsive force is confined. He further supposes that the attractive force is constant throughout the minute distance to which it extends, but

that the repulsive force increases rapidly as the distance diminishes. He thus shows that at a curved part of the surface, a superficial particle would be urged towards the centre of curvature of the surface, and he gives reasons for concluding that this force is proportional to the sum of the curvatures of the surface in two normal planes at right angles to each other.

The subject was next taken up by Laplace.⁴ His results are in many respects identical with those of Young, but his methods of arriving at them are very different, being conducted entirely by mathematical calculations. The form into which he has thrown his investigation seems to have deterred many able physicists from the inquiry into the ulterior cause of capillary phenomena, and induced them to rest content with deriving them from the fact of surface-tension. But for those who wish to study the molecular constitution of bodies it is necessary to study the effect of forces which are sensible only at insensible distances; and Laplace has furnished us with an example of the method of this study which has never been surpassed. Laplace investigates the force acting on the fluid contained in an infinitely slender canal normal to the surface of the fluid arising from the attraction of the parts of the fluid outside the canal. He thus finds for the pressure at a point in the interior of the fluid an expression of the form

$$p = K + \frac{1}{2} H \left(\frac{1}{R} + \frac{1}{R'} \right),$$

where K is a constant pressure, probably very large, which, however, does not influence capillary phenomena, and therefore cannot be determined from observation of such phenomena; H is another constant on which all capillary phenomena depend; and R and R' are the radii of curvature of any two normal sections of the surface at right angles to each other.

In the first part of our own investigation we shall adhere to the symbols used by Laplace, as we shall find that an accurate knowledge of the physical interpretation of these symbols is necessary for the further investigation of the subject. In the *Supplement to the Theory of Capillary Action*, Laplace deduces the equation of the surface of the fluid from the condition that the resultant force on a particle at the surface must be normal to the surface. His explanation, however, of the rise of a liquid in a tube is based on the assumption of the constancy of the angle of contact for the same solid and fluid, and of this he has nowhere given a satisfactory proof. In this supplement Laplace gives many important applications of the theory, and compares the results with the experiments of Gay-Lussac.

The next great step in the treatment of the subject was made by Gauss.⁵ The principle which he adopts is that of virtual velocities, a principle which under his hands was gradually transforming itself into what is now known as the principle of the conservation of energy. Instead of calculating the direction and magnitude of the resultant force on each particle arising from the action of neighbouring particles, he forms a single expression which is the aggregate of all the potentials arising from the mutual action between pairs of particles. This expression has been called the force-function. With its sign reversed it is now called the potential energy of the system. It consists of three parts, the first depending on the action of gravity, the second on the mutual action between the particles of the fluid, and the third on the action between the particles of the fluid and the particles of a solid or fluid in contact with it.

The condition of equilibrium is that this expression (which we may for the sake of distinctness call the potential energy) shall be a minimum. This condition when worked out gives not only the equation of the free surface in the form already established by Laplace, but the conditions of the angle of contact of this surface with the surface of a solid.

Gauss thus supplied the principal defect in the great work of Laplace. He also pointed out more distinctly the nature of the assumptions which we must make with respect to the law of action of the particles in order to be consistent with observed phenomena. He did not, however, enter into the explanation of particular phenomena, as this had been done already by Laplace. He points out, however, to physicists the advantages of the method of Segner and Gay-Lussac, afterwards carried out by Quincke, of measuring the dimensions of large drops of mercury on a horizontal or slightly concave surface, and those of large bubbles of air in transparent liquids resting against the under side of a horizontal plate of a substance wetted by the liquid.

In 1831 Poisson published his *Nouvelle Theorie de l'Action Capillaire*. He maintains that there is a rapid variation of density near the surface of a liquid, and he gives very strong reasons, which have been only strengthened by subsequent discoveries, for believing that this is the case. He then proceeds to an investigation of the equilibrium of a fluid on the hypothesis of uniform density, and he arrives at the conclusion that on this hypothesis none of the observed capillary phenomena would take place, and that, therefore, Laplace's theory, in which the density is supposed uniform, is not only insufficient but erroneous. In particular he maintains that the constant pressure K , which occurs in Laplace's theory, and which on that theory is very large, must be in point of fact very small, but the equation of equilibrium from which he concludes this is itself defective. Laplace assumes that the liquid has uniform density, and that the attraction of its molecules extends to a finite though insensible distance. On these assumptions his results are certainly right, and are confirmed by the independent method of Gauss, so that the objections raised against them by Poisson fall to the ground. But whether the assumption of uniform density be physically correct is a very different question, and Poisson has done good service to science in showing how to carry on the investigation on the hypothesis that the density very near the surface is different from that in the interior of the fluid.

The result, however, of Poisson's investigation is practically equivalent to that already obtained by Laplace. In both theories the equation of the liquid surface is the same, involving a constant H , which can be determined only by experiment. The only difference is in the manner in which this quantity H depends on the law of the molecular forces and the law of density near the surface of the fluid, and as these laws are unknown to us we cannot obtain any test to discriminate between the two theories.

We have now described the principal forms of the theory of capillary action during its earlier development. In more recent times the method of Gauss has been modified so as to take account of the variation of density near the surface, and its language has been translated in terms of the modern doctrine of the conservation of energy.¹

M. Plateau,² who has himself made the most elaborate study of the phenomena of surface-tension, has adopted the

following method of getting rid of the effects of gravity: He forms a mixture of alcohol and water of the same density as olive oil. He then introduces a quantity of oil into the mixture. It assumes the form of a sphere under the action of surface-tension alone. He then, by means of rings of iron-wire, disks, and other contrivances, alters the form of certain parts of the surface of the oil. The free portions of the surface then assume new forms depending on the equilibrium of surface-tension. In this way he has produced a great many of the forms of equilibrium of a liquid under the action of surface-tension alone, and compared them with the results of mathematical investigation. He has also greatly facilitated the study of liquid films by showing how to form a liquid, the films of which will last for twelve or even for twenty-four hours. The debt which science owes to M. Plateau is not diminished by the fact that, while investigating these beautiful phenomena, he has never-himself seen them. He lost his sight long ago in the pursuit of science, and has ever since been obliged to depend on the eyes and the hands of others.

M. Van der Mensbrugghe³ has also devised a great number of beautiful illustrations of the phenomena of surface-tension, and has shown their connection with the experiments of Mr Tomlinson on the figures formed by oils dropped on the clean surface of water.

M. Dupré in his 5th, 6th, and 7th Memoirs on the Mechanical Theory of Heat (*Ann. de Chimie et de Physique*, 1866 to 1868) has done much towards applying the principles of thermodynamics to capillary phenomena, and the experiments of his son are exceedingly ingenious and well devised, tracing the influence of surface-tension in a great number of very different circumstances, and deducing from independent methods the numerical value of the surface-tension. The experimental evidence which M Dupré has obtained bearing on the molecular structure of liquids must be very valuable, even if many of our present opinions on this subject should turn out to be erroneous.

M. Quincke⁴ has made a most elaborate series of experiments on the tension of the surfaces separating one liquid from another and from air.

M. Lütge⁵ has experimented on liquid films, and has shown how a film of a liquid of high surface-tension is replaced by a film of lower surface-tension. He has also experimented on the effects of the thickness of the film, and has come to the conclusion that the thinner a film is, the greater is its tension. This result, however, has been tested by M. Van der Mensbrugghe, who finds that the tension is the same for the same liquid whatever be the thickness, as long as the film does not burst. The phenomena of very thin liquid films deserve the most careful study, for it is in this way that we are most likely to obtain evidence by which we may test the theories of the molecular structure of liquids.

Sir W. Thomson⁶ has investigated the effect of the curvature of the surface of a liquid on the thermal equilibrium between the liquid and the vapour in contact with it. He has also calculated the effect of surface-tension on the propagation of waves on the surface of a liquid, and has determined the minimum velocity of a wave, and the velocity of the wind when it is just sufficient to disturb the surface of still water.⁷

THEORY OF CAPILLARY ACTION.

When two different fluids are placed in contact, they may either diffuse into each other or remain separate. In

some cases diffusion takes place to a limited extent, after which the resulting mixtures do not mix with each other. The same substance may be able to exist in two different states at the same temperature and pressure, as when water and its saturated vapour are contained in the same vessel. The conditions under which the thermal and mechanical equilibrium of two fluids, two mixtures, or the same substance in two physical states in contact with each other, is possible belong to thermodynamics. All that we have to observe at present is that, in the cases in which the fluids do not mix of themselves, the potential energy of the system must be greater when the fluids are mixed than when they are separate.

It is found by experiment that it is only very close to the bounding surface of a liquid that the forces arising from the mutual action of its parts have any resultant effect on one of its particles. The experiments of Quincke and others seem to show that the extreme range of the forces which produce capillary action lies between a thousandth and a twenty thousandth part of a millimetre.

We shall use the symbol ϵ to denote this extreme range, beyond which the action of these forces may be regarded as insensible. If χ denotes the potential energy of unit of mass of the substance, we may treat χ as sensibly constant except within a distance ϵ of the bounding surface of the fluid. In the interior of the fluid it has the uniform value χ_0 . In like manner the density, ρ , is sensibly equal to the constant quantity ρ_0 , which is its value in the interior of the liquid, except within a distance ϵ of the bounding surface. Hence if V is the volume of a mass M of liquid bounded by a surface whose area is S , the integral

$$M = \iiint \rho dx dy dz \quad (1),$$

where the integration is to be extended throughout the volume V , may be divided into two parts by considering separately the thin shell or skin extending from the outer surface to a depth ϵ , within which the density and other properties of the liquid vary with the depth, and the interior portion of the liquid within which its properties are constant.

Since ϵ is a line of insensible magnitude compared with the dimensions of the mass of liquid and the principal radii of curvature of its surface, the volume of the shell whose surface is S and thickness ϵ will be $S\epsilon$, and that of the interior space will be $V - S\epsilon$.

If we suppose a normal ν less than ϵ to be drawn from the surface S into the liquid, we may divide the shell into elementary shells whose thickness is $d\nu$, in each of which the density and other properties of the liquid will be constant.

The volume of one of these shells will be $Sd\nu$. Its mass will be $\rho d\nu$. The mass of the whole shell will therefore be $S \int_0^\epsilon \rho d\nu$, and that of the interior part of the liquid ($V - S\epsilon$) ρ_0 . We thus find for the whole mass of the liquid

$$M = V\rho_0 - S \int_0^\epsilon (\rho_0 - \rho) d\nu \quad (2).$$

To find the potential energy we have to integrate

$$E = \iiint \chi \rho dx dy dz \quad (3).$$

Substituting $\chi\rho$ for ρ in the process we have just gone through, we find

$$E = V\chi_0\rho_0 - S \int_0^\epsilon (\chi_0\rho_0 - \chi\rho) d\nu \quad (4).$$

Multiplying equation (2) by χ_0 , and subtracting it from (4),

$$E - M\chi_0 = \chi_0 S \int_0^\epsilon (\chi - \chi_0) \rho d\nu \quad (5).$$

In this expression M and χ_0 are both constant, so that the variations of the right hand side of the equation is the same as that of the energy E , and expresses that part of the energy which depends on the area of the bounding surface of the liquid. We may call this the surface energy.

The symbol χ expresses the energy of unit of mass of the liquid at a depth ν within the bounding surface. When the liquid is in contact with a rare medium, such as its own vapour or any other

gas, χ is greater than χ_0 , and the surface energy is positive. By the principle of the conservation of energy, any displacement of the liquid by which its energy is diminished will tend to take place of itself. Hence if the energy is the greater, the greater the area of the exposed surface, the liquid will tend to move in such a way as to diminish the area of the exposed surface, or in other words, the exposed surface will tend to diminish if it can do so consistently with the other conditions. This tendency of the surface to contract itself is called the surface-tension of liquids.

M. Dupré has described an arrangement by which the surface-tension of a liquid film may be illustrated.

A piece of sheet metal is cut out in the form AA (fig. 1). A very fine slip of metal is laid on it in the position BB, and the whole is dipped into a solution of soap, or M. Plateau's glycerine mixture. When it is taken out the rectangle AACC is filled up by a liquid film. This film, however, tends to contract on itself, and the loose strip of metal BB will, if it is let go, be drawn up towards AA, provided it is sufficiently light and smooth.

Fig. 1.

Let T be the surface energy per unit of area; then the energy of a surface of area S will be ST . If, in the rectangle AACC, $AA = a$, and $CC = b$, its area is $S = ab$, and its energy Tab . Hence if F is the force by which the slip BB is pulled towards AA,

$$F = \frac{d}{db} Tab = Ta \quad (6),$$

or the force arising from the surface-tension acting on a length a of the strip is Ta , so that T represents the surface-tension acting transversely on every unit of length of the periphery of the liquid surface. Hence if we write

$$T = \int_0^\epsilon (\chi - \chi_0) \rho d\nu \quad (7),$$

we may define T either as the surface-energy per unit of area, or as the surface-tension per unit of contour, for the numerical values of these two quantities are equal.

If the liquid is bounded by a dense substance, whether liquid or solid, the value of χ may be different from its value when the liquid has a free surface. If the liquid is in contact with another liquid, let us distinguish quantities belonging to the two liquids by suffixes. We shall then have

$$E_1 - M_1\chi_{01} = S \int_0^{\epsilon_1} (\chi_1 - \chi_{01}) \rho_1 d\nu_1 \quad (8),$$

$$E_2 - M_2\chi_{02} = S \int_0^{\epsilon_2} (\chi_2 - \chi_{02}) \rho_2 d\nu_2 \quad (9).$$

Adding these expressions, and dividing the second member by S , we obtain for the tension of the surface of contact of the two liquids

$$T_{1,2} = \int_0^{\epsilon_1} (\chi_1 - \chi_{01}) \rho_1 d\nu_1 + \int_0^{\epsilon_2} (\chi_2 - \chi_{02}) \rho_2 d\nu_2 \quad (10).$$

If this quantity is positive, the surface of contact will tend to contract, and the liquids will remain distinct. If, however, it were negative, the displacement of the liquids which tends to enlarge the surface of contact would be aided by the molecular forces, so that the liquids, if not kept separate by gravity, would at length become thoroughly mixed. No instance, however, of a phenomenon of this kind has been discovered, for those liquids which mix of themselves do so by the process of diffusion, which is a molecular motion, and not by the spontaneous puckering and replication of the bounding surface as would be the case if T were negative.

It is probable, however, that there are many cases in which the integral belonging to the less dense fluid is negative. If the denser body be solid we can often demonstrate this; for the liquid tends to spread itself over the surface of the solid, so as to increase the area of the surface of contact, even although in so doing it is obliged to increase the free surface in opposition to the surface-tension. Thus water spreads itself out on a clean surface of glass. This shows that $\int_0^\epsilon (\chi - \chi_0) \rho d\nu$ must be negative for water in contact with glass.

ON THE TENSION OF LIQUID FILMS.

The method already given for the investigation of the surface-tension of a liquid, all whose dimensions are sensible, fails in the case of a liquid film such as a soap-bubble. In such a film it is possible that no part of the liquid may be so far from the surface as to have the potential and density corresponding to what we have called the interior of a liquid mass, and measurements of the

tension of the film when drawn out to different degrees of thinness may possibly lead to an estimate of the range of the molecular forces, or at least of the depth within a liquid mass, at which its properties become sensibly uniform. We shall therefore indicate a method of investigating the tension of such films.

Let S be the area of the film, M its mass, and E its energy; σ the mass, and e the energy of unit of area; then

$$M = S\sigma \quad (11),$$

$$E = Se \quad (12).$$

Let us now suppose that by some change in the form of the boundary of the film its area is changed from S to $S + dS$. If its tension is T the work required to effect this increase of surface will be TdS , and the energy of the film will be increased by this amount. Hence

$$TdS = dE = Sde + e dS \quad (13).$$

But since M is constant,

$$dM = Sd\sigma + \sigma dS = 0 \quad (14).$$

Eliminating dS from equations (13) and (14), and dividing by S , we find

$$T = e - \sigma \frac{de}{d\sigma} \quad (15).$$

In this expression σ denotes the mass of unit of area of the film, and e the energy of unit of area.

If we take the axis of z normal to either surface of the film, the radius of curvature of which we suppose to be very great compared with its thickness e , and if ρ is the density, and χ the energy of unit of mass at depth z , then

$$\sigma = \int_0^e \rho dz \quad (16),$$

and

$$e = \int_0^e \chi \rho dz \quad (17).$$

Both ρ and χ are functions of z , the value of which remains the same when $z - e$ is substituted for z . If the thickness of the film is greater than $2e$, there will be a stratum of thickness $e - 2e$ in the middle of the film, within which the values of ρ and χ will be ρ_0 and χ_0 . In the two strata on either side of this the law, according to which ρ and χ depend on the depth, will be the same as in a liquid mass of large dimensions. Hence in this case

$$\sigma = (e - 2e)\rho_0 + 2 \int_0^e \rho dz \quad (18),$$

$$e = (e - 2e)\chi_0\rho_0 + 2 \int_0^e \chi \rho dz \quad (19),$$

$$\frac{d\sigma}{de} = \rho_0, \quad \frac{de}{d\sigma} = \chi_0\rho_0, \quad \therefore \frac{de}{d\sigma} = \chi_0,$$

$$T = 2 \int_0^e \chi \rho dz - 2\chi_0 \rho_0 \int_0^e \rho dz, \\ = 2 \int_0^e (\chi - \chi_0) \rho dz \quad (20).$$

Hence the tension of a thick film is equal to the sum of the tensions of its two surfaces as already calculated (equation 7). On the hypothesis of uniform density we shall find that this is true for films whose thickness exceeds e .

The symbol χ is defined as the energy of unit of mass of the substance. A knowledge of the absolute value of this energy is not required, since in every expression in which it occurs it is under the form $\chi - \chi_0$, that is to say, the difference between the energy in two different states. The only cases, however, in which we have experimental values of this quantity are when the substance is either liquid and surrounded by similar liquid, or gaseous and surrounded by similar gas. It is impossible to make direct measurements of the properties of particles of the substance within the insensible distance e of the bounding surface.

When a liquid is in thermal and dynamical equilibrium with its vapour, then if ρ' and χ' are the values of ρ and χ for the vapour, and ρ_0 and χ_0 those for the liquid,

$$\chi' - \chi_0 = J - p \left(\frac{1}{\rho'} - \frac{1}{\rho_0} \right) \quad (21),$$

where J is the dynamical equivalent of heat, L is the latent heat of unit of mass of the vapour, and p is the pressure. At points in the liquid very near its surface it is probable that χ is greater than χ_0 , and at points in the gas very near the surface of the liquid it is probable that χ is less than χ' , but this has not as yet been ascertained experimentally. We shall therefore endeavour to apply to this subject the methods used in Thermodynamics, and where these fail us we shall have recourse to the hypotheses of molecular physics.

We have next to determine the value of χ in terms of the action

between one particle and another. Let us suppose that the force between two particles m and m' at the distance f is

$$F = m m' \left(\phi(f) + \frac{C}{f^2} \right) \quad (22),$$

being reckoned positive when the force is attractive. The actual force between the particles arises in part from their mutual gravitation, which is inversely as the square of the distance. This force is expressed by $m m' \frac{C}{f^2}$. It is easy to show that a force subject to this law would not account for capillary action. We shall, therefore, in what follows, consider only that part of the force which depends on $\phi(f)$, where $\phi(f)$ is a function of f which is insensible for all sensible values of f , but which becomes sensible and even enormously great when f is exceedingly small.

If we next introduce a new function of f and write

$$\int_f^\infty \phi(f) df = \Pi(f) \quad (23),$$

then $m m' \Pi(f)$ will represent—1. The work done by the attractive force on the particle m , while it is brought from an infinite distance from m' to the distance f from m' ; or 2. The attraction of a particle m on a narrow straight rod resolved in the direction of the length of the rod, one extremity of the rod being at a distance f from m , and the other at an infinite distance, the mass of unit of length of the rod being m' . The function $\Pi(f)$ is also insensible for sensible values of f , but for insensible values of f it may become sensible and even very great.

If we next write

$$\int_z^\infty f \Pi(f) df = \psi(z) \quad (24),$$

then $2\pi m \sigma \psi(z)$ will represent—1. The work done by the attractive force while a particle m is brought from an infinite distance to a distance z from an infinitely thin stratum of the substance whose mass per unit of area is σ ; 2. The attraction of a particle m placed at a distance z from the plano surface of an infinite solid whose density is σ .

Let us examine the case in which the particle m is placed at a distance z from a curved stratum of the substance, whose principal radii of curvature are R_1 and R_2 . Let P (fig. 2) be the particle and PB a normal to the surface. Let the plane of the paper be a normal section of the surface of the stratum at the point B , making an angle ω with the section whose radius of curvature is R_1 . Then if O is the centre of curvature in the plane of the paper, and $BO = u$,

Fig. 2.

$$\frac{1}{u} = \frac{\cos^2 \omega}{R_1} + \frac{\sin^2 \omega}{R_2} \quad (25).$$

Let $POQ = \theta$, $PO = r$, $PQ = f$, $BP = z$,

$$f^2 = u^2 + r^2 - 2ur \cos \theta \quad (26).$$

The element of the stratum at Q may be expressed by

$$\sigma u^2 \sin \theta d\theta d\omega,$$

or expressing $d\theta$ in terms of df by (26),

$$\sigma \frac{u}{r} f df d\omega.$$

Multiplying this by m and by $\Pi(f)$, we obtain for the work done by the attraction of this element when m is brought from an infinite distance to P ,

$$m \sigma \frac{u}{r} f \Pi(f) df d\omega.$$

Integrating with respect to f from $f = z$ to $f = a$, where a is a line very great compared with the extreme range of the molecular force, but very small compared with either of the radii of curvature, we obtain for the work

$$\int m \sigma \frac{u}{r} \left(\psi(z) - \psi(a) \right) d\omega,$$

and since $\psi(a)$ is an insensible quantity we may omit it. We may also write

$$\frac{u}{r} = 1 + \frac{z}{u} + \&c.,$$

since z is very small compared with u , and expressing u in terms of ω by (25), we find

$$\int_0^{2\pi} m \sigma \psi(z) \left\{ 1 + z \left(\frac{\cos^2 \omega}{R_1} + \frac{\sin^2 \omega}{R_2} \right) \right\} d\omega \\ = 2\pi m \sigma \psi(z) \left\{ 1 + \frac{1}{2} z \left(\frac{1}{R_1} + \frac{1}{R_2} \right) \right\}.$$

This then expresses the work done by the attractive forces when a particle m is brought from an infinite distance to the point P at a

distance z from a stratum whose surface-density is σ , and whose principal radii of curvature are R_1 and R_2 .

To find the work done when m is brought to the point P in the neighbourhood of a solid body, the density of which is a function of the depth z below the surface, we have only to write instead of σ ρdz , and to integrate

$$2\pi m \int_z^\infty \rho \psi(z) dz + \pi m \left(\frac{1}{R_1} + \frac{1}{R_2} \right) \int_z^\infty \rho z \psi(z) dz,$$

where, in general, we must suppose ρ a function of z . This expression, when integrated, gives (1) the work done on a particle m while it is brought from an infinite distance to the point P, or (2) the attraction on a long slender column normal to the surface and terminating at P, the mass of unit of length of the column being m . In the form of the theory given by Laplace, the density of the liquid was supposed to be uniform. Hence if we write

$$K = 2\pi \int_0^\infty \psi(z) dz, \quad H = 2\pi \int_0^\infty z \psi(z) dz,$$

the pressure of a column of the fluid itself terminating at the surface will be

$$\rho^2 \left\{ K + \frac{1}{2} H \left(\frac{1}{R_1} + \frac{1}{R_2} \right) \right\},$$

and the work done by the attractive forces when a particle m is brought to the surface of the fluid from an infinite distance will be

$$m\rho \left\{ K + \frac{1}{2} H \left(\frac{1}{R_1} + \frac{1}{R_2} \right) \right\}.$$

If we write

$$\int_z^\infty \psi(z) dz = \theta(z),$$

then $2\pi m\rho\theta(z)$ will express the work done by the attractive forces, while a particle m is brought from an infinite distance to a distance z from the plane surface of a mass of the substance of density ρ and infinitely thick. The function $\theta(z)$ is insensible for all sensible values of z . For insensible values it may become sensible, but it must remain finite even when $z=0$, in which case $\theta(0)=K$.

If χ' is the potential energy of unit of mass of the substance in vapour, then at a distance z from the plane surface of the liquid

$$\chi = \chi' - 2\pi\rho\theta(z).$$

At the surface

$$\chi = \chi' - 2\pi\rho\theta(0).$$

At a distance z within the surface

$$\chi = \chi' - 4\pi\rho\theta(0) + 2\pi\rho\theta(z).$$

If the liquid forms a stratum of thickness c , then

$$\chi = \chi' - 4\pi\rho\theta(0) + 2\pi\rho\theta(z) + 2\pi\rho\theta(z-c).$$

The surface-density of this stratum is $\sigma = c\rho$. The energy per unit of area is

$$c = \int_0^c \chi \rho dz \\ = c\rho(\chi' - 4\pi\rho\theta(0)) + 2\pi\rho^2 \int_0^c \theta(z) dz + 2\pi\rho^2 \int_0^c \theta(c-z) dz.$$

Since the two sides of the stratum are similar the last two terms are equal, and

$$c = c\rho(\chi' - 4\pi\rho\theta(0)) + 4\pi\rho^2 \int_0^c \theta(z) dz.$$

Differentiating with respect to c , we find

$$\frac{d\sigma}{dc} = \rho, \\ \frac{dc}{dc} = \rho(\chi' - 4\pi\rho\theta(0)) + 4\pi\rho^2\theta(c).$$

Hence the surface-tension

$$T = c - \sigma \frac{dc}{d\sigma} \\ = 4\pi\rho^2 \left(\int_0^c \theta(z) dz - c\theta(c) \right).$$

Integrating the first term within brackets by parts, it becomes

$$c\theta(c) - 0\theta(0) - \int_0^c z \frac{d\theta}{dz} dz.$$

Remembering that $\theta(0)$ is a finite quantity, and that $\frac{d\theta}{dz} = -\psi(z)$, we find

$$T = 4\pi\rho^2 \int_0^c z \psi(z) dz.$$

When c is greater than ϵ this is equivalent to $2H$ in the equation of Laplace. Hence the tension is the same for all films thicker than ϵ , the range of the molecular forces. For thinner films

$$\frac{dT}{dc} = 4\pi\sigma^2\psi(c).$$

Hence if $\psi(c)$ is positive, the tension and the thickness will increase together. Now $2\pi m\rho\psi(c)$ represents the attraction between a particle m and the plane surface of an infinite mass of the liquid, when the distance of the particle outside the surface is c . Now, the force between the particle and the liquid is certainly, on the whole, attractive; but if between any two small values of c it should be repulsive, then for films whose thickness lies between these values the tension will increase as the thickness diminishes, but for all other cases the tension will diminish as the thickness diminishes.

We have given several examples in which the density is assumed to be uniform, because Poisson has asserted that capillary phenomena would not take place unless the density varied rapidly near the surface. In this assertion we think he was mathematically wrong, though in his own hypothesis that the density does actually vary, he was probably right. In fact, the quantity $4\pi\rho^2K$, which we may call with Van der Waals the molecular pressure, is so great for most liquids (5000 atmospheres for water), that in the parts near the surface, where the molecular pressure varies rapidly, we may expect considerable variation of density, even when we take into account the smallness of the compressibility of liquids.

The pressure at any point of the liquid arises from two causes, the external pressure P to which the liquid is subjected, and the pressure arising from the mutual attraction of its molecules. If we suppose that the number of molecules within the range of the attraction of a given molecule is very large, the part of the pressure arising from attraction will be proportional to the square of the number of molecules in unit of volume, that is, to the square of the density. Hence we may write

$$p = P + \Lambda\rho^2 \quad (1),$$

where Λ is a constant. But by the equations of equilibrium of the liquid

$$dp = -\rho^2\chi. \quad (2),$$

Hence

$$-\rho^2\chi = 2\Lambda\rho dp \quad (3),$$

and

$$\chi' - \chi = 2\Lambda\rho - 2B \quad (4),$$

where B is another constant.

Near the plane surface of a liquid we may assume ρ a function of z . We have then for the value of χ at the point where $z=c$,

$$\chi' - \chi = 2\pi \int_{c-\epsilon}^{c+\epsilon} \rho(z)\psi(z-c) dz \quad (5),$$

where ϵ is the range beyond which the attraction of a mass of liquid bounded by a plane surface becomes insensible. The value of χ depends, therefore, on those values only of ρ which correspond to strata for which z is nearly equal to c . We may, therefore, expand ρ in terms of $z-c$, or writing x for $z-c$,

$$\rho = \rho_c + x \left(\frac{d\rho}{dz} \right)_c + \frac{x^2}{2} \left(\frac{d^2\rho}{dz^2} \right)_c + \&c. \quad (6),$$

where the suffix (c) denotes that in the quantity to which it is applied after differentiation, z is to be made equal to c . We may now write

$$\chi' - \chi = 2\pi\rho(c) \int_{-\epsilon}^{+\epsilon} \psi(x) dx + 2\pi \left(\frac{d\rho}{dz} \right)_c \int_{-\epsilon}^{+\epsilon} x\psi(x) dx + \\ 2\pi \left(\frac{d^2\rho}{dz^2} \right)_c \frac{1}{2} \int_{-\epsilon}^{+\epsilon} x^2\psi(x) dx + \&c. \quad (7).$$

The function $\psi(x)$ has equal values for $+x$ and $-x$. Hence $\int_{-\epsilon}^{+\epsilon} x^n\psi(x) dx$ vanishes if n is odd.

But if we write

$$K = \pi \int_{-\epsilon}^{+\epsilon} \psi(x) dx, \quad L = \frac{1}{2} \pi \int_{-\epsilon}^{+\epsilon} x^2\psi(x) dx,$$

$$M = \frac{1}{1.2.3.4} \pi \int_{-\epsilon}^{+\epsilon} x^4\psi(x) dx, \&c.$$

$$\chi' - \chi = 2K\rho + 2L \frac{d^2\rho}{dz^2} + 2M \frac{d^4\rho}{dz^4} + \&c.$$

This is the expression for χ on the hypothesis that the value of ρ can be expanded in a series of powers of $z-c$ within the limits $z-\epsilon$ and $z+\epsilon$. It is only when the point P is within the distance ϵ of the surface of the liquid that this ceases to be possible.

If we now substitute for χ its value from equation 4, we obtain

$$2\Lambda\rho - 2B = 2K\rho + 2L \frac{d^2\rho}{dz^2} + 2M \frac{d^4\rho}{dz^4} + \&c.,$$

a linear differential equation in ρ , the solution of which is

$$\rho = \frac{B}{\Lambda - K} + C_1 e^{n_1 z} + C_2 e^{n_2 z} + C_3 e^{n_3 z} + C_4 e^{n_4 z},$$

where n_1, n_2, n_3, n_4 are the roots of the equation

$$Mn^4 + Ln^2 + K - \Lambda = 0.$$

The coefficient M is less than $\epsilon^2 L$, where ϵ is the range of the

attractive force. Hence we may consider M very small compared with L . If we neglect M altogether,

$$n_1 = \sqrt{\frac{A-K}{L}}, \quad n_2 = -\sqrt{\frac{A-K}{L}}.$$

If we assume a quantity a such that $a^2K=2L$, we may call a the average range of the molecular forces. If we also take b , so that $ba=1$, we may call b the modulus of the variation of the density near the surface.

Our calculation hitherto has been made on the hypothesis that a is small when compared with b , and in that case we have found that $a^2 : b^2 :: A-K : K$.

But it appears from experiments on liquids that $A-K$ is in general large when compared with K , and sometimes very large. Hence we conclude, first, that the hypothesis of our calculation is incorrect, and, secondly, that the phenomena of capillary action do not in any very great degree depend on the variation of density near the surface, but that the principal part of the force depends on the finite range of the molecular action.

In the following table, $\Delta\rho$ is half the cubical elasticity of the liquid, and $K\rho$ the molecular pressure, both expressed in atmospheres (the absolute value of an atmosphere being one million in centimetre-gramme-second measure, see below, p. 70). ρ is the density, T the surface-tension, and a the average range of the molecular action, as calculated by Von der Waals from the values of T and K .

The unit in which a is expressed is $1\text{ cm} \times 10^{-9}$; a is therefore the twenty-millionth part of a centimetre for mercury, the thirty-millionth for water, and the forty-millionth part for alcohol. Quinke, however, found by direct experiment that certain molecular actions were sensible at a distance of a two-hundred-thousandth part of a centimetre, so that we cannot regard any of these numbers as accurate.

ON SURFACE-TENSION.

Definition.—The tension of a liquid surface across any line drawn on the surface is normal to the line, and is the same for all directions of the line, and is measured by the force across an element of the line divided by the length of that element.

Experimental Laws of Surface-tension.

1. For any given liquid surface, as the surface which separates water from air, or oil from water, the surface-tension is the same at every point of the surface and in every direction. It is also practically independent of the curvature of the surface, although it appears from the mathematical theory that there is a slight increase of tension where the mean curvature of the surface is concave, and a slight diminution where it is convex. The amount of this increase and diminution is too small to be directly measured, though it has a certain theoretical importance in the explanation of the equilibrium of the superficial layer of the liquid where it is inclined to the horizon.

2. The surface-tension diminishes as the temperature rises, and when the temperature reaches that of the critical point at which the distinction between the liquid and its vapour ceases, it has been observed by Andrews that the capillary action also vanishes. The early writers on capillary action supposed that the diminution of capillary action was due simply to the change of density corresponding to the rise of temperature, and, therefore, assuming the surface-tension to vary as the square of the density, they deduced its variations from the observed dilatation of the liquid by heat. This assumption, however, does not appear to be verified by the experiments of Brunner and Wolff on the rise of water in tubes at different temperatures.

3. The tension of the surface separating two liquids which do not mix cannot be deduced by any known method from the tensions of the surfaces of the liquids when separately in contact with air.

When the surface is curved, the effect of the surface-tension is to make the pressure on the concave side exceed the pressure on the convex side by $T \left(\frac{1}{R_1} + \frac{1}{R_2} \right)$, where T is the intensity of the surface-tension and R_1, R_2 are the radii of curvature of any two sections normal to the surface and to each other.

If three fluids which do not mix are in contact with each other, the three surfaces of separation meet in a line, straight or curved. Let O (fig. 3) be a point in this line, and let the plane of the paper be supposed to be normal to the line at the point O . The three angles between the tangent planes to the three surfaces of separation at the point O are completely determined by the tensions of the three surfaces. For if in the triangle abc the side ab is

Fig. 3.

taken so as to represent on a given scale the tension of the surface of contact of the fluids a and b , and if the other sides bc and ca are taken so as to represent on the same scale the tensions of the surfaces between b and c and between c and a respectively, then the condition of equilibrium at O for the corresponding tensions R, P , and Q is that the angle ROP shall be the supplement of abc , POQ of bca , and, therefore, QOR of cab . Thus the angles at which the surfaces of separation meet are the same at all parts of the line of concurrence of the three fluids. When three films of the same liquid meet, their tensions are equal, and, therefore, they make angles of 120° with each other. The froth of soap-suds or beat-up eggs consists of a multitude of small films which meet each other at angles of 120° .

If four fluids, a, b, c, d , meet in a point O , and if a tetrahedron $ABCD$ is formed so that its edge AB represents the tension of the surface of contact of the liquids a and b , BC that of b and c , and so on; then if we place this tetrahedron so that the face ABC is normal to the tangent at O to the line of concurrence of the fluids abc , and turn it so that the edge AB is normal to the tangent plane at O to the surface of contact of the fluids a and b , then the other three faces of the tetrahedron will be normal to the tangents at O to the other three lines of concurrence of the liquids, and the other five edges of the tetrahedron will be normal to the tangent planes at O to the other five surfaces of contact.

If six films of the same liquid meet in a point the corresponding tetrahedron is a regular tetrahedron, and each film, where it meets the others, has an angle whose cosine is $-\frac{1}{3}$. Hence if we take two nets of wire with hexagonal meshes, and place one on the other so that the point of concurrence of three hexagons of one net coincides with the middle of a hexagon of the other, and if we then, after dipping them in Plateau's liquid, place them horizontally, and gently raise the upper one, we shall develop a system of plane laminae arranged as the walls and floors of the cells are arranged in a honeycomb. We must not, however, raise the upper net too much, or the system of films will become unstable.

When a drop of one liquid, B , is placed on the surface of another, A , the phenomena which take place depend on the relative magnitude of the three surface-tensions corresponding to the surface between A and air, between B

and air, and between A and B. If no one of these tensions is greater than the sum of the other two, the drop will assume the form of a lens, the angles which the upper and lower surfaces of the lens make with the free surface of A and with each other being equal to the external angles of the triangle of forces. Such lenses are often seen formed by drops of fat floating on the surface of hot water, soup, or gravy. But when the surface-tension of A exceeds the sum of the tensions of the surfaces of contact of B with air and with A, it is impossible to construct the triangle of forces, so that equilibrium becomes impossible. The edge of the drop is drawn out by the surface-tension of A with a force greater than the sum of the tensions of the two surfaces of the drop. The drop, therefore, spreads itself out, with great velocity, over the surface of A till it covers an enormous area, and is reduced to such extreme tenuity that it is not probable that it retains the same properties of surface-tension which it has in a large mass. Thus a drop of train oil will spread itself over the surface of the sea till it shows the colours of thin plates. These rapidly descend in Newton's scale and at last disappear, showing that the thickness of the film is less than the tenth part of the length of a wave of light. But even when thus attenuated, the film may be proved to be present, since the surface-tension of the liquid is considerably less than that of pure water. This may be shown by placing another drop of oil on the surface. This drop will not spread out like the first drop, but will take the form of a flat lens with a distinct circular edge, showing that the surface-tension of what is still apparently pure water is now less than the sum of the tensions of the surfaces separating oil from air and water.

The spreading of drops on the surface of a liquid has formed the subject of a very extensive series of experiments by Mr Tomlinson. M. Van der Mensbrugghe has also written a very complete memoir on this subject.¹

When a solid body is in contact with two fluids, the surface of the solid cannot alter its form, but the angle at which the surface of contact of the two fluids meets the surface of the solid depends on the values of the three surface-tensions. If a and b are the two fluids and c the solid then the equilibrium of the tensions at the point O depends only on that of thin components parallel to the surface, because the surface-tensions normal to the surface are balanced by the resistance of the solid. Hence if the angle ROQ (fig. 4) at which the surface of contact OP meets the solid is denoted by α ,

Fig. 4.

$$T_{bc} - T_{ca} - T_{ab} \cos. \alpha = 0,$$

whence

$$\cos. \alpha = \frac{T_{bc} - T_{ca}}{T_{ab}}.$$

As an experiment on the angle of contact only gives us the difference of the surface-tensions at the solid surface, we cannot determine their actual value. It is theoretically probable that they are often negative, and may be called surface-pressures.

The constancy of the angle of contact between the surface of a fluid and a solid was first pointed out by Dr Young, who states that the angle of contact between mercury and glass is about 140° . Quincke makes it $128^\circ 52'$.

If the tension of the surface between the solid and one of the fluids exceeds the sum of the other two tensions, the point of contact will not be in equilibrium, but will be dragged towards the side on which the tension is greatest. If the quantity of the first fluid is small it will stand in a

drop on the surface of the solid without wetting it. If the quantity of the second fluid is small it will spread itself over the surface and wet the solid. The angle of contact of the first fluid is 180° and that of the second is zero.

If a drop of alcohol be made to touch one side of a drop of oil on a glass plate, the alcohol will appear to chase the oil over the plate, and if a drop of water and a drop of bisulphide of carbon be placed in contact in a horizontal capillary tube, the bisulphide of carbon will chase the water along the tube. In both cases the liquids move in the direction in which the surface-pressure at the solid is least.

ON THE RISE OF A LIQUID IN A TUBE.

Let a tube (fig. 5) whose internal radius is r , made of a solid substance c , be dipped into a liquid a . Let us suppose that the angle of contact for this liquid with the solid c is an acute angle. This implies that the tension of the free surface of the solid c is greater than that of the surface of contact of the solid with the liquid a . Now consider the tension

Fig. 5.

surface of the free surface of the liquid a . All round its edge there is a tension T acting at an angle α with the vertical. The circumference of the edge is $2\pi r$, so that the resultant of this tension is a force $2\pi r T \cos. \alpha$ acting vertically upwards on the liquid. Hence the liquid will rise in the tube till the weight of the vertical column between the free surface and the level of the liquid in the vessel balances the resultant of the surface-tension. The upper surface of this column is not level, so that the height of the column cannot be directly measured, but let us assume that h is the mean height of the column, that is to say, the height of a column of equal weight, but with a flat top. Then if r is the radius of the tube at the top of the column, the volume of the suspended column is $\pi r^2 h$, and its weight is $\pi r^2 h \rho g$, when ρ is its density and g the intensity of gravity. Equating this force with the resultant of the tension

$$\pi r^2 h \rho g = 2\pi r T \cos. \alpha,$$

or

$$h = \frac{2T \cos. \alpha}{\rho g r}.$$

Hence the mean height to which the fluid rises is inversely as the radius of the tube. For water in a clean glass tube the angle of contact is zero, and

$$h = \frac{2T}{\rho g r}.$$

For mercury in a glass tube the angle of contact is $128^\circ 52'$, the cosine of which is negative. Hence when a glass tube is dipped into a vessel of mercury, the mercury within the tube stands at a lower level than outside it.

RISE OF A LIQUID BETWEEN TWO PLATES.

When two parallel plates are placed vertically in a liquid the liquid rises between them. If we now suppose fig. 5 to represent a vertical section perpendicular to the plates, we may calculate the rise of the liquid. Let l be the breadth of the plates measured perpendicularly to the

¹ Sur la Tension Superficielle des Liquides, Bruxelles, 1873.

plane of the paper, then the length of the line which bounds the wet and the dry parts of the plates inside is l for each surface, and on this the tension T acts at an angle α to the vertical. Hence the resultant of the surface-tension is $2lT \cos. \alpha$. If the distance between the inner surfaces of the plates is a , and if the mean height of the film of fluid which rises between them is h , the weight of fluid raised is $\rho g h l a$. Equating the forces—

$$\rho g h l a = 2lT \cos. \alpha,$$

whence

$$h = \frac{2T \cos. \alpha}{\rho g a}.$$

This expression is the same as that for the rise of a liquid in a tube, except that instead of r , the radius of the tube, we have a the distance of the plates.

FORM OF THE CAPILLARY SURFACE.

The form of the surface of a liquid acted on by gravity is easily determined if we assume that near the part considered the line of contact of the surface of the liquid with that of the solid bounding it is straight and horizontal, as it is when the solids which constrain the liquid are bounded by surfaces formed by horizontal and parallel generating lines. This will be the case, for instance, near a flat plate dipped into the liquid. If we suppose these generating lines to be normal to the plane of the paper then all sections of the solids parallel to this plane will be equal and similar to each other, and the section of the surface of the liquid will be of the same form for all such sections.

Let us consider the portion of the liquid between two parallel sections distant one unit of length. Let P_1, P_2 (fig. 6) be two points of the surface; θ_1, θ_2 , the inclination of the surface to the horizon at P_1 and P_2 ; y_1, y_2 , the heights of P_1 and P_2 above the level of the liquid at a distance from all solid bodies. The pressure at any point of the liquid which is above this level is negative unless another fluid as, for instance, the air, presses on the upper surface, but it is only the difference of pressures with which we have to do, because two equal pressures on opposite sides of the surface produce no effect.

We may, therefore, write for the pressure at a height y

$$p = -\rho g y,$$

where ρ is the density of the liquid, or if there are two fluids the excess of the density of the lower fluid over that of the upper one.

The forces acting on the portion of liquid $P_1 P_2 A_2 A_1$ are—first, the horizontal pressures, $-\frac{1}{2} \rho g y_1^2$ and $\frac{1}{2} \rho g y_2^2$; second, the surface-tension T acting at P_1 and P_2 in directions inclined θ_1 and θ_2 to the horizon. Resolving horizontally we find—

$$T(\cos. \theta_2 - \cos. \theta_1) + \frac{1}{2} \rho g (y_2^2 - y_1^2) = 0,$$

whence

$$\cos. \theta_2 = \cos. \theta_1 - \frac{1}{2} \frac{\rho g}{T} (y_1^2 - y_2^2),$$

or if we suppose P_1 fixed and P_2 variable, we may write

$$\cos. \theta = \frac{1}{2} \frac{\rho g}{T} y^2 + \text{constant}.$$

This equation gives a relation between the inclination of the curve to the horizon and the height above the level of the liquid.

Resolving vertically we find that the weight of the liquid raised above the level must be equal to $T(\sin. \theta_2 - \sin. \theta_1)$,

and this is therefore equal to the area $P_1 P_2 A_2 A_1$, multiplied by $g\rho$. The form of the capillary surface is identical with that of the "elastic curve," or the curve formed by a uniform spring originally straight, when its ends are acted on by equal and opposite forces applied either to the ends themselves or to solid pieces attached to them. Drawings of the different forms of the curve may be found in Thomson and Tait's *Natural Philosophy*, vol. i. p. 455.

We shall next consider the rise of a liquid between two plates of different materials for which the angles of contact are α_1 and α_2 , the distance between the plates being a , a small quantity. Since the plates are very near one another we may use the following equation of the surface as an approximation:—

$$y = h_1 + Ax + Bx^2 \\ h_2 = h_1 + Aa + Ba^2,$$

whence

$$\cot. \alpha_1 = -A \\ \cot. \alpha_2 = A + 2Ba$$

$$T(\cos. \alpha_1 + \cos. \alpha_2) = \rho g a \left(h_1 + \frac{1}{2} Aa + \frac{1}{3} Ba^2 \right),$$

whence we obtain

$$h_1 = \frac{T}{\rho g a} (\cos. \alpha_1 + \cos. \alpha_2) + \frac{a}{6} (2 \cot. \alpha_1 - \cot. \alpha_2)$$

$$h_2 = \frac{T}{\rho g a} (\cos. \alpha_1 + \cos. \alpha_2) + \frac{a}{6} (2 \cot. \alpha_2 - \cot. \alpha_1).$$

Let X be the force which must be applied in a horizontal direction to either plate to keep it from approaching the other, then the forces acting on the first plate are $T + X$ in the negative direction, and $T \sin. \alpha_1 + \frac{1}{2} \rho g h_1^2$ in the positive direction. Hence

$$X = \frac{1}{2} \rho g h_1^2 - T(1 - \sin. \alpha_1).$$

For the second plate

$$X = \frac{1}{2} \rho g h_2^2 - T(1 - \sin. \alpha_2).$$

Hence

$$X = \frac{1}{4} \rho g (h_1^2 + h_2^2) - T \left(1 - \frac{1}{2} (\sin. \alpha_1 + \sin. \alpha_2) \right),$$

or, substituting the values of h_1 and h_2 ,

$$X = \frac{1}{2} \frac{T^2}{\rho g a^2} (\cos. \alpha_1 + \cos. \alpha_2)^2$$

$$- T \left\{ 1 - \frac{1}{2} (\sin. \alpha_1 + \sin. \alpha_2) - \frac{1}{12} (\cos. \alpha_1 + \cos. \alpha_2) (\cot. \alpha_1 + \cot. \alpha_2) \right\},$$

the remaining terms being negligible when a is small. The force, therefore, with which the two plates are drawn together consists first of a positive part, or in other words an attraction, varying inversely as the square of the distance, and second, of a negative part or repulsion independent of the distance. Hence in all cases except that in which the angles α_1 and α_2 are supplementary to each other, the force is attractive when a is small enough, but when $\cos. \alpha_1$ and $\cos. \alpha_2$ are of different signs, as when the liquid is raised by one plate, and depressed by the other, the first term may be so small that the repulsion indicated by the second term comes into play. The fact that a pair of plates which repel one another at a certain distance may attract one another at a smaller distance was deduced by Laplace from theory, and verified by the observations of the Abbé Hairy.

A DROP BETWEEN TWO PLATES.

If a small quantity of a liquid which wets glass be introduced between two glass plates slightly inclined to each

Fig. 7.

Fig. 6.

other, it will run towards that part where the glass plates are nearest together. When the liquid is in equilibrium it forms a thin film, the outer edge of which is all of the same thickness. If d is the distance between the plates at the edge of the film and Π the atmospheric pressure, the pressure of the liquid in the film is $\Pi - \frac{2T \cos. \alpha}{d}$, and if A is the area of the film between the plates and B its circumference, the plates will be pressed together with a force

$$\frac{2AT \cos. \alpha}{d} + BT \sin. \alpha,$$

and this, whether the atmosphere exerts any pressure or not. The force thus produced by the introduction of a drop of water between two plates is enormous, and is often sufficient to press certain parts of the plates together so powerfully as to bruise them or break them. When two blocks of ice are placed loosely together so that the superfluous water which melts from them may drain away, the remaining water draws the blocks together with a force sufficient to cause the blocks to adhere by the process called *Regelation*.

In many experiments bodies are floated on the surface of water in order that they may be free to move under the action of slight horizontal forces. Thus Newton placed a magnet in a floating vessel and a piece of iron in another in order to observe their mutual action, and Ampère floated a voltaic battery with a coil of wire in its circuit in order to observe the effects of the earth's magnetism on the electric circuit. When such floating bodies come near the edge of the vessel they are drawn up to it, and are apt to stick fast to it. There are two ways of avoiding this inconvenience. One is to grease the float round its water-line so that the water is depressed round it. This, however, often produces a worse disturbing effect, because a thin film of grease spreads over the water and increases its surface-viscosity. The other method is to fill the vessel with water till the level of the water stands a little higher than the rim of the vessel. The float will then be repelled from the edge of the vessel. Such floats, however, should always be made so that the section taken at the level of the water is as small as possible.

PHENOMENA ARISING FROM THE VARIATION OF THE SURFACE-TENSION.

Pure water has a higher surface-tension than that of any other substance liquid at ordinary temperatures except mercury. Hence any other liquid if mixed with water diminishes its surface-tension. For example, if a drop of alcohol be placed on the surface of water, the surface-tension will be diminished from 80, the value for pure water, to 25, the value for pure alcohol. The surface of the liquid will therefore no longer be in equilibrium, and a current will be formed at and near the surface from the alcohol to the surrounding water, and this current will go on as long as there is more alcohol at one part of the surface than at another. If the vessel is deep, these currents will be balanced by counter currents below them, but if the depth of the water is only two or three millimetres, the surface-current will sweep away the whole of the water, leaving a dry spot where the alcohol was dropped in. This phenomenon was first described and explained by Professor James Thomson, who also explained a phenomenon, the converse of this, called the "tears of strong wine."

If a wine glass be half-filled with port wine the liquid rises a little up the side of the glass as other liquids do. The wine, however, contains alcohol and water, both of which evaporate, but the alcohol faster than the water, so that the superficial layer becomes more watery. In the middle of the vessel the superficial layer recovers its strength by diffusion from below, but the film adhering to

the side of the glass becomes more watery, and therefore has a higher surface-tension than the surface of the stronger wine. It therefore creeps up the side of the glass dragging the strong wine after it, and this goes on till the quantity of fluid dragged up collects into a drop and runs down the side of the glass.

The motion of small pieces of camphor floating on water arises from the gradual solution of the camphor. If this takes place more rapidly on one side of the piece of camphor than on the other side, the surface-tension becomes weaker where there is most camphor in solution, and the lump, being pulled unequally by the surface-tensions, moves off in the direction of the strongest tension, namely, towards the side on which least camphor is dissolved.

If a drop of ether is held near the surface of water the vapour of ether condenses on the surface of the water, and surface-currents are formed flowing in every direction away from under the drop of ether.

If we place a small floating body in a shallow vessel of water and wet one side of it with alcohol or ether, it will move off with great velocity and skim about on the surface of the water, the part wet with alcohol being always the stern.

The surface-tension of mercury is greatly altered by slight changes in the state of the surface. The surface-tension of pure mercury is so great that it is very difficult to keep it clean, for every kind of oil or grease spreads over it at once.

But the most remarkable effects of change of surface-tension are those produced by what is called the electric polarization of the surface. The tension of the surface of contact of mercury and dilute sulphuric acid depends on the electromotive force acting between the mercury and the acid. If the electromotive force is from the acid to the mercury the surface-tension increases; if it is from the mercury to the acid, it diminishes. Faraday observed that a large drop of mercury, resting on the flat bottom of a vessel containing dilute acid, changes its form in a remarkable way when connected with one of the electrodes of a battery, the other electrode being placed in the acid. When the mercury is made positive it becomes dull and spreads itself out; when it is made negative it gathers itself together and becomes bright again. M. Lippmann, who has made a careful investigation of the subject, finds that exceedingly small variations of the electromotive force produce sensible changes in the surface-tension. The effect of one of a Daniell's cell is to increase the tension from 30.4 to 40.6. He has constructed a capillary electrometer by which differences of electric potential less than 0.01 of that of a Daniell's cell can be detected by the difference of the pressure required to force the mercury to a given point of a fine capillary tube. He has also constructed an apparatus in which this variation in the surface-tension is made to do work and drive a machine. He has also found that this action is reversible, for when the area of the surface of contact of the acid and mercury is made to increase, an electric current passes from the mercury to the acid, the amount of electricity which passes while the surface increases by one square centimetre being sufficient to decompose 0.00013 grammes of water.

ON THE FORMS OF LIQUID FILMS WHICH ARE FIGURES OF REVOLUTION.

A spherical Soap-bubble.

A soap-bubble is simply a small quantity of soap-suds spread out so as to expose a large surface to the air. The bubble, in fact, has two surfaces, an outer and an inner surface, both exposed to air. It has, therefore, a certain amount of surface-energy depending on the area of these

two surfaces. Since in the case of thin films the outer and inner surfaces are approximately equal, we shall consider the area of the film as representing either of them, and shall use the symbol T to denote the energy of unit of area of the film, both surfaces being taken together. If T' is the energy of a single surface of the liquid, T the energy of the film is $2T'$. When by means of a tube we blow air into the inside of the bubble we increase its volume and therefore its surface, and at the same time we do work in forcing air into it, and thus increase the energy of the bubble.

That the bubble has energy may be shown by leaving the end of the tube open. The bubble will contract, forcing the air out, and the current of air blown through the tube may be made to deflect the flame of a candle. If the bubble is in the form of a sphere of radius r this material surface will have an area

$$S=4\pi r^2. \dots\dots\dots (1).$$

If T be the energy corresponding to unit of area of the film the surface-energy of the whole bubble will be

$$ST=4\pi r^2T. \dots\dots\dots (2).$$

The increment of this energy corresponding to an increase of the radius from r to $r + dr$ is therefore

$$TdS=8\pi rTdr. \dots\dots\dots (3).$$

Now this increase of energy was obtained by forcing in air at a pressure greater than the atmospheric pressure, and thus increasing the volume of the bubble.

Let Π be the atmospheric pressure and $\Pi + p$ the pressure of the air within the bubble. The volume of the sphere is

$$V=\frac{4}{3}\pi r^3. \dots\dots\dots (4).$$

and the increment of volume is

$$dV=4\pi r^2dr. \dots\dots\dots (5).$$

Now if we suppose a quantity of air already at the pressure $\Pi + p$, the work done in forcing it into the bubble is $p dV$. Hence the equation of work and energy is

$$p dV=TdS. \dots\dots\dots (6),$$

or

$$4\pi pr^2dr=8\pi rdrT \dots\dots\dots (7),$$

or

$$p=2T\frac{1}{r} \dots\dots\dots (8).$$

This, therefore, is the excess of the pressure of the air within the bubble over that of the external air, and it is due to the action of the inner and outer surfaces of the bubble. We may conceive this pressure to arise from the tendency which the bubble has to contract, or in other words from the surface-tension of the bubble.

If to increase the area of the surface requires the expenditure of work, the surface must resist extension, and if the bubble in contracting can do work, the surface must tend to contract. The surface must therefore act like a sheet of india-rubber when extended both in length and breadth, that is, it must exert surface-tension. The tension of the sheet of india-rubber, however, depends on the extent to which it is stretched, and may be different in different directions, whereas the tension of the surface of a liquid remains the same however much the film is extended, and the tension at any point is the same in all directions.

The intensity of this surface-tension is measured by the stress which it exerts across a line of unit length. Let us measure it in the case of the spherical soap-bubble by considering the stress exerted by one hemisphere of the bubble on the other, across the circumference of a great circle. This stress is balanced by the pressure p acting over the area of the same great circle: it is therefore equal to πr^2p .

To determine the intensity of the surface-tension we have to divide this quantity by the length of the line across which it acts, which is in this case the circumference of a great circle $2\pi r$. Dividing πr^2p by this length we obtain $\frac{1}{2}pr$ as the value of the intensity of the surface-tension, and it is plain from equation 8 that this is equal to T . Hence the numerical value of the intensity of the surface-tension is equal to the numerical value of the surface-energy per unit of surface. We must remember that since the film has two surfaces the surface-tension of the film is double the tension of the surface of the liquid of which it is formed.

To determine the relation between the surface-tension and the pressure which balances it when the form of the surface is not spherical, let us consider the following case:—

Let fig. 3. represent a section through the axis Cc of a soap-bubble in the form of a figure of revolution bounded by two circular disks AB and ab , and having the meridian section APa . Let PQ be an imaginary section normal to the axis. Let the radius of this section PR be y , and let PT , the tangent at P , make an angle α with the axis.

Fig. 3.

Let us consider the stresses which are exerted across this imaginary section by the lower part on the upper part. If the internal pressure exceeds the external pressure by p , there is in the first place a force $\pi y p$ acting upwards arising from the pressure p over the area of the section. In the next place, there is the surface-tension acting downwards, but at an angle α with the vertical, across the circular section of the bubble itself, whose circumference is $2\pi y$, and the downward force is therefore $2\pi y T \cos. \alpha$.

Now these forces are balanced by the external force which acts on the disk ACB , which we may call F . Hence equating the forces which act on the portion included between ACB and PRQ

$$\pi y^2 p - 2\pi y T \cos. \alpha = - F \dots\dots\dots (9).$$

If we make $CR = r$, and suppose r to vary, the shape of the bubble of course remaining the same, the values of y and of α will change, but the other quantities will be constant. In studying these variations we may if we please take as our independent variable the length s of the meridian section AP reckoned from A . Differentiating equation 9 with respect to s we obtain, after dividing by 2π as a common factor

$$py\frac{dy}{ds} - T \cos. \alpha \frac{dy}{ds} + Ty \sin. \alpha \frac{d\alpha}{ds} = 0. \dots\dots (10).$$

Now

$$\frac{dy}{ds} = \sin. \alpha \dots\dots\dots (11).$$

The radius of curvature of the meridian section is

$$R_1 = -\frac{ds}{d\alpha} \dots\dots\dots (12).$$

The radius of curvature of a normal section of the surface at right angles to the meridian section is equal to the part of the normal cut off by the axis, which is

$$R_2 = PN = \frac{y}{\cos. \alpha} \dots\dots\dots (13).$$

Hence dividing equation 10 by $y \sin. \alpha$, we find

$$p = T \left(\frac{1}{R_1} + \frac{1}{R_2} \right) \dots\dots\dots (14).$$

This equation, which gives the pressure in terms of the

principal radii of curvature, though here proved only in the case of a surface of revolution, must be true of all surfaces. For the curvature of any surface at a given point may be completely defined in terms of the positions of its principal normal sections and their radii of curvature.

Before going further we may deduce from equation 9 the nature of all the figures of revolution which a liquid film can assume. Let us first determine the nature of a curve, such that if it is rolled on the axis its origin will trace out the meridian section of the bubble. Since at any instant the rolling curve is rotating about the point of contact with the axis, the line drawn from this point of contact to the tracing point must be normal to the direction of motion of the tracing point. Hence if N is the point of contact, NP must be normal to the traced curve. Also, since the axis is a tangent to the rolling curve, the ordinate PR is the perpendicular from the tracing point P on the tangent. Hence the relation between the radius vector and the perpendicular on the tangent of the rolling curve must be identical with the relation between the normal PN and the ordinate PR of the traced curve. If we write r for PN , then $y = r \cos \alpha$, and equation 9 becomes

$$y^2 \left(2 \frac{T}{pr} - 1 \right) = \frac{F}{\pi p}.$$

This relation between y and r is identical with the relation between the perpendicular from the focus of a conic section on the tangent at a given point and the focal distance of that point, provided the transverse and conjugate axes of the conic are $2a$ and $2b$ respectively, where

$$a = \frac{T}{p}, \text{ and } b^2 = \frac{F}{\pi p}.$$

Hence the meridian section of the film may be traced by the focus of such a conic, if the conic is made to roll on the axis.

ON THE DIFFERENT FORMS OF THE MERIDIAN LINE.

(1.) When the conic is an ellipse the meridian line is in the form of a series of waves, and the film itself has a series of alternate swellings and contractions as represented in figs. 8 and 9. This form of the film is called the unduloid.

(1a.) When the ellipse becomes a circle, the meridian line becomes a straight line parallel to the axis, and the film passes into the form of a cylinder of revolution.

(1b.) As the ellipse degenerates into the straight line joining its foci, the contracted parts of the unduloid become narrower, till at last the figure becomes a series of spheres in contact.

In all these cases the internal pressure exceeds the external by $\frac{2T}{a}$ where a is the semitransverse axis of the conic. The resultant of the internal pressure and the surface-tension is equivalent to a tension along the axis, and the numerical value of this tension is equal to the force due to the action of this pressure on a circle whose diameter is equal to the conjugate axis of the ellipse.

(2.) When the conic is a parabola the meridian line is a catenary (fig. 10), the internal pressure is equal to the external pressure, and the tension along the axis is equal to $2\pi Tm$ where m is the distance of the vertex from the focus.

(3.) When the conic is a hyperbola the meridian line is in the form of a looped curve (fig. 11). The corresponding figure of the film is called the nodoid. The resultant of the internal pressure and the surface-tension is equivalent to a pressure along the axis equal to that due to a pressure p acting on a circle whose diameter is the conjugate axis of the hyperbola.

When the conjugate axis of the hyperbola is made

smaller and smaller, the nodoid approximates more and more to the series of spheres touching each other along the axis. When the conjugate axis of the hyperbola increases without limit, the loops of the nodoid are crowded on one another, and each becomes more nearly a ring of circular section, without, however, ever reaching this form. The only closed surface belonging to the series is the sphere.

These figures of revolution have been studied mathematically by Poisson,¹ Goldschmidt,² Lindelöf and Moigno,³ Delaunay,⁴ Lamarle,⁵ Beer,⁶ and Mannheim,⁷ and have been produced experimentally by Plateau⁸ in the two different ways already described.

FIG. 9.—Unduloid. FIG. 10.—Catenoid. FIG. 11.—Nodoid.

The limiting conditions of the stability of these figures have been studied both mathematically and experimentally. We shall notice only two of them, the cylinder and the catenoid.

STABILITY OF THE CYLINDER.

The cylinder is the limiting form of the unduloid when the rolling ellipse becomes a circle. When the ellipse differs infinitely little from a circle, the equation of the meridian line becomes approximately $y = a + c \sin \frac{x}{a}$ where c is small. This is a simple harmonic wave-line, whose mean distance from the axis is a , whose wave-length is $2\pi a$, and whose amplitude is c . The internal pressure corresponding to this unduloid is as before $p = \frac{T}{a}$. Now consider a portion of a cylindric film of length x terminated by two equal disks

Fig. 12.

of radius r and containing a certain volume of air. Let one of these disks be made to approach the other by a small quantity dx . The film will swell out into the convex part of an unduloid, having its largest section midway between the disks, and we have to determine whether the internal pressure will be greater or less than before. If A and C (fig. 12) are the disks, and if x the distance between the disks is equal to πr half the wave-length of the harmonic curve, the disks will be at the points where the curve is at its mean distance from the axis, and the pressure will therefore be $\frac{T}{r}$ as before. If A_1 , C_1 are the disks, so that the distance between them is less than πr , the curve must be produced beyond the disks before it is at its mean distance from the axis. Hence in this case the mean distance is less than r , and the pressure will be greater than $\frac{T}{r}$. If, on the other hand, the disks are at A_2 and C_2 , so that the distance between them is greater than πr , the curve will reach its mean dis-

⁸ *Statique expérimentale et théorique des liquides*

tance from the axis before it reaches the disks. The mean distance will therefore be greater than r , and the pressure will be less than $\frac{T}{r}$. Hence if one of the disks be made to approach the other, the internal pressure will be increased if the distance between the disks is less than half the circumference of either, and the pressure will be diminished if the distance is greater than this quantity. In the same way we may show that if the distance between the disks is increased, the pressure will be diminished or increased according as the distance is less or more than half the circumference of either.

Now let us consider a cylindric film contained between two equal fixed disks A and B, and let a third disk, C, be placed midway between. Let C be slightly displaced towards A. If AC and CB are each less than half the circumference of a disk the pressure on C will increase on the side of A and diminish on the side of B. The resultant force on C will therefore tend to oppose the displacement and to bring C back to its original position. The equilibrium of C is therefore stable. It is easy to show that if C had been placed in any other position than the middle, its equilibrium would have been stable. Hence the film is stable as regards longitudinal displacements. It is also stable as regards displacements transverse to the axis, for the film is in a state of tension, and any lateral displacement of its middle parts would produce a resultant force tending to restore the film to its original position. Hence if the length of the cylindric film is less than its circumference, it is in stable equilibrium. But if the length of the cylindric film is greater than its circumference, and if we suppose the disk C to be placed midway between A and B, and to be moved towards A, the pressure on the side next A will diminish, and that on the side next B will increase, so that the resultant force will tend to increase the displacement, and the equilibrium of the disk C is therefore unstable. Hence the equilibrium of a cylindric film whose length is greater than its circumference is unstable. Such a film, if ever so little disturbed, will begin to contract at one section and to expand at another, till its form ceases to resemble a cylinder, if it does not break up into two parts which become ultimately portions of spheres.

INSTABILITY OF A JET OF LIQUID.

When a liquid flows out of a vessel through a circular opening in the bottom of the vessel, the form of the stream is at first nearly cylindrical though its diameter gradually diminishes from the orifice downwards on account of the increasing velocity of the liquid. But the liquid after it leaves the vessel is subject to no forces except gravity, the pressure of the air, and its own surface-tension. Of these gravity has no effect on the form of the stream except in drawing asunder its parts in a vertical direction, because the lower parts are moving faster than the upper parts. The resistance of the air produces little disturbance until the velocity becomes very great. But the surface-tension, acting on a cylindric column of liquid whose length exceeds the limit of stability, begins to produce enlargements and contractions in the stream as soon as the liquid has left the orifice, and these inequalities in the figure of the column go on increasing till it is broken up into elongated fragments. These fragments as they are falling through the air continue to be acted on by surface-tension. They therefore shorten themselves, and after a series of oscillations in which they become alternately elongated and flattened, settle down into the form of spherical drops.

This process, which we have followed as it takes place on an individual portion of the falling liquid, goes through its

several phases at different distances from the orifice, so that if we examine different portions of the stream as it descends, we shall find next the orifice the unbroken column, then a series of contractions and enlargements, then elongated drops, then flattened drops, and so on till the drops become spherical.

STABILITY OF THE CATENOID.

When the internal pressure is equal to the external, the film forms a surface of which the mean curvature at every point is zero. The only surface of revolution having this property is the catenoid formed by the revolution of a catenary about its directrix. This catenoid, however, is in stable equilibrium only when the portion considered is such that the tangents to the catenary at its extremities intersect before they reach the directrix.

To prove this, let us consider the catenary as the form of equilibrium of a chain suspended between two fixed points A and B. Suppose the chain hanging between A and B to be of very great length, then the tension at A or B will be very great. Let the chain be hauled in over a peg at A. At first the tension will diminish, but if the process be continued the tension will reach a minimum value and will afterwards increase to infinity as the chain between A and B approaches to the form of a straight line. Hence for every tension greater than the minimum tension there are two catenaries passing through A and B. Since the tension is measured by the height above the directrix these two catenaries have the same directrix. Every catenary lying between them has its directrix higher, and every catenary lying beyond them has its directrix lower than that of the two catenaries.

Now let us consider the surfaces of revolution formed by this system of catenaries revolving about the directrix of the two catenaries of equal tension. We know that the radius of curvature of a surface of revolution in the plane normal to the meridian plane is the portion of the normal intercepted by the axis of revolution.

The radius of curvature of a catenary is equal and opposite to the portion of the normal intercepted by the directrix of the catenary. Hence a catenoid whose directrix coincides with the axis of revolution has at every point its principal radii of curvature equal and opposite, so that the mean curvature of the surface is zero.

The catenaries which lie between the two whose directrix coincides with the axis of revolution generate surfaces whose radius of curvature convex towards the axis in the meridian plane is less than the radius of concave curvature. The mean curvature of these surfaces is therefore convex towards the axis. The catenaries which lie beyond the two generate surfaces whose radius of curvature convex towards the axis in the meridian plane is greater than the radius of concave curvature. The mean curvature of these surfaces is, therefore, concave towards the axis.

Now if the pressure is equal on both sides of a liquid film, if its mean curvature is zero, it will be in equilibrium. This is the case with the two catenoids. If the mean curvature is convex towards the axis the film will move from the axis. Hence if a film in the form of the catenoid which is nearest the axis is ever so slightly displaced from the axis it will move further from the axis till it reaches the other catenoid.

If the mean curvature is concave towards the axis the film will tend to approach the axis. Hence if a film in the form of the catenoid which is nearest the axis be displaced towards the axis, it will tend to move further towards the axis and will collapse. Hence the film in the form of the catenoid which is nearest the axis is in unstable equilibrium under the condition that it is exposed to equal pressures within and without. If, however, the circular ends of the

catenoid are closed with solid disks, so that the volume of air contained between these disks and the film is determinate, the film will be in stable equilibrium however large a portion of the catenary it may consist of.

The criterion as to whether any given catenoid is stable or not may be obtained as follows.

Let $PABQ$ and $ApgB$ (fig. 13) be two catenaries having the same directrix and intersecting in A and B . Draw Pp and Qq touching both catenaries, Pp and Qq will intersect at T , a point in the directrix; for since any catenary with its directrix is a similar figure to any other catenary with its directrix, if the directrix of the one coincides with that of the other the centre of similitude must lie on the common directrix. Also, since the curves at P and p are equally inclined to the directrix, P and p are corresponding points and the line Pp must pass through the centre of similitude. Similarly Qq must pass through the centre of similitude. Hence T , the point of intersection of Pp and Qq , must be the centre of similitude and must be on the common directrix. Hence the tangents at A and B to the upper catenary must intersect above the directrix, and the tangents at A and B to the lower catenary must intersect below the directrix. The condition of stability of a catenoid is therefore that the tangents at the extremities of its generating catenary must intersect before they reach the directrix.

Fig. 13.

STABILITY OF A PLANE SURFACE.

We shall next consider the limiting conditions of stability of the horizontal surface which separates a heavier fluid above from a lighter fluid below. Thus, in an experiment of M. Duprez,¹ a vessel containing olive oil is placed with its mouth downwards in a vessel containing a mixture of alcohol and water, the mixture being denser than the oil. The surface of separation is in this case horizontal and stable, so that the equilibrium is established of itself. Alcohol is then added very gradually to the mixture till it becomes lighter than the oil. The equilibrium of the fluids would now be unstable if it were not for the tension of the surface which separates them, and which, when the orifice of the vessel is not too large, continues to preserve the stability of the equilibrium.

When the equilibrium at last becomes unstable, the destruction of equilibrium takes place by the lighter fluid ascending in one part of the orifice and the heavier descending in the other. Hence the displacement of the surface to which we must direct our attention is one which does not alter the volume of the liquid in the vessel, and which therefore is upward in one part of the surface and downward in another. The simplest case is that of a rectangular orifice in a horizontal plane, the sides being a and b .

Let the surface of separation be originally in the plane of the orifice, and let the co-ordinates x and y be measured from one corner parallel to the sides a and b respectively, and let z be measured upwards. Then if ρ be the density of the upper liquid, and σ that of the lower liquid, and P the original pressure at the surface of separation, then when the surface receives an upward displacement z , the pressure above it will be $P - \rho gz$, and that below it will be $P - \sigma gz$, so that the surface will be acted on by an upward pressure $(\rho - \sigma)gz$.

Now if the displacement z be everywhere very small, the curvature in the planes parallel to xz and yz will be $\frac{d^2z}{dx^2}$ and $\frac{d^2z}{dy^2}$ respectively; and if T is the surface-tension the whole upward force will be

$$T \left(\frac{d^2z}{dx^2} + \frac{d^2z}{dy^2} \right) + (\rho - \sigma)gz.$$

If this quantity is of the same sign as z , the displacement will be increased, and the equilibrium will be unstable. If it is of the opposite sign from z , the equilibrium will be stable. The limiting condition may be found by putting it equal to zero. One form of the solution of the equation, and that which is applicable to the case of a rectangular orifice, is

$$z = C \sin. px \sin. qy.$$

Substituting in the equation we find the condition

$$(p^2 + q^2) T - (\rho - \sigma)g = \begin{cases} +ve \text{ stable.} \\ 0 \text{ neutral.} \\ -ve \text{ unstable.} \end{cases}$$

That the surface may coincide with the edge of the orifice, which is a rectangle, whose sides are a and b , we must have

$$pa = m\pi, \quad qb = n\pi,$$

when m and n are integral numbers. Also, if m and n are both unity, the displacement will be entirely positive, and the volume of the liquid will not be constant. That the volume may be constant, either n or m must be an even number. We have, therefore, to consider the conditions under which

$$\pi^2 \left(\frac{m^2}{a^2} + \frac{n^2}{b^2} \right) T - (\rho - \sigma)g$$

cannot be made negative. Under these conditions the equilibrium is stable for all small displacements of the surface. The smallest admissible value of $\frac{m^2}{a^2} + \frac{n^2}{b^2}$ is $\frac{4}{a^2} + \frac{1}{b^2}$, where a is the longer side of the rectangle. Hence the condition of stability is that

$$\pi^2 \left(\frac{4}{a^2} + \frac{1}{b^2} \right) T - (\rho - \sigma)g$$

is a positive quantity. When the breadth b is less than $\sqrt{\frac{\pi^2 T}{(\rho - \sigma)g}}$ the length a may be unlimited.

When the orifice is circular of radius a , the limiting value of

a is $\sqrt{\frac{T}{\rho g}} z$, where z is the least root of the equation

$$\frac{2}{z} J_1(z) = 1 - \frac{z^2}{2 \cdot 4} + \frac{z^4}{2 \cdot 4^2 \cdot 6} - \frac{z^6}{2 \cdot 4^2 \cdot 6^2 \cdot 8} + \&c., = 0.$$

The least root of this equation is

$$z = 3.83171.$$

If h is the height to which the liquid will rise in a capillary tube of unit radius, then the diameter of the largest orifice is

$$2a = 3.8317 \sqrt{2h} \\ = 5.4188 \sqrt{h}.$$

M. Duprez found from his experiments

$$2a = 5.485 \sqrt{h}.$$

EFFECT OF SURFACE-TENSION ON THE VELOCITY OF WAVES.²

When a series of waves are propagated on the surface of a liquid, the surface-tension has the effect of increasing the pressure at the crests of the waves and diminishing it in the troughs. If the wave-length is λ , the equation of the surface is

$$y = b \sin. 2\pi \frac{x}{\lambda}.$$

The pressure due to the surface-tension T is

$$p = -T \frac{d^2y}{dx^2} = \frac{4\pi^2}{\lambda^2} T y.$$

This pressure must be added to the pressure due to gravity gpy . Hence the waves will be propagated as if the intensity of gravity had been

$$f = g + \frac{4\pi^2}{\lambda^2} \frac{T}{\rho}$$

instead of g . Now it is shown in hydrodynamics that the

¹ "Sur un cas particulier de l'équilibre des liquides," par F. Duprez, *Nouveaux Mém. de l'Acad. de Belgique*, 1851 et 1854.

² See Sir W. Thomson, "Hydrokinetic Solutions and Observations," *Phil. Mag.*, Nov. 1871.

velocity of propagation of waves in deep water is that acquired by a heavy body falling through half the radius of the circle whose circumference is the wave-length, or

$$v = \sqrt{\frac{f\lambda}{2\pi}} \\ = \sqrt{\frac{\lambda g}{2\pi} \div \frac{2\pi T}{\lambda \rho}}$$

This velocity is a minimum when

$$\lambda = 2\pi \sqrt{\frac{T}{g\rho}}$$

and the minimum value is

$$v = \sqrt{\frac{Tg}{\rho}}$$

For waves whose length from crest to crest is greater than λ , the principal force concerned in the motion is that of gravitation. For waves whose length is less than λ the principal force concerned is that of surface-tension. Sir William Thomson proposes to distinguish the latter kind of waves by the name of ripples.

When a small body is partly immersed in a liquid originally at rest, and moves horizontally with constant velocity V , waves are propagated through the liquid with various velocities according to their respective wave-lengths. In front of the body the relative velocity of the fluid and the body varies from V where the fluid is at rest, to zero at the cutwater on the front surface of the body. The waves produced by the body will travel forwards faster than the body till they reach a distance from it at which the relative velocity of the body and the fluid is equal to the velocity of propagation corresponding to the wave-length. The waves then travel along with the body at a constant distance in front of it. Hence at a certain distance in front of the body there is a series of waves which are stationary with respect to the body. Of these, the waves of minimum velocity form a stationary wave nearest to the front of the body. Between the body and this first wave the surface is comparatively smooth. Then comes the stationary wave of minimum velocity, which is the most marked of the series. In front of this is a double series of stationary waves, the gravitation waves forming a series increasing in wave length with their distance in front of the body, and the surface-tension waves or ripples diminishing in wave-length with their distance from the body, and both sets of waves rapidly diminishing in amplitude with their distance from the body.

If the current-function of the water referred to the body considered as origin is ψ , then the equation of the form of the crest of a wave of velocity w , the crest of which travels along with the body, is

$$d\psi = w ds$$

where ds is an element of the length of the crest. To integrate this equation for a solid of given form is probably difficult, but it is easy to see that at some distance on either side of the body, where the liquid is sensibly at rest, the crest of the wave will approximate to an asymptote inclined to the path of the body at an angle whose sine is $\frac{w}{V}$, where w is the velocity of the wave and V is that of the body.

The crests of the different kinds of waves will therefore appear to diverge as they get further from the body, and the waves themselves will be less and less perceptible. But those whose wave-length is near to that of the wave of minimum velocity will diverge less than any of the others, so that the most marked feature at a distance from the body will be the two long-lines of ripples of minimum velocity. If the angle between these is 2θ , the velocity of

the body is $w \sec. \theta$, where w for water is about 23 centimetres per second.

TABLES OF SURFACE TENSION.

In the following tables the units of length, mass, and time are the centimetre, the gramme, and the second, and the unit of force is that which if it acted on one gramme for one second would communicate to it a velocity of one centimetre per second :—

Table of Surface-Tension at 20° C. (Quincke).

Quincke has determined the surface-tension of a great many substances near their point of fusion or solidification. His method was that of observing the form of a large drop standing on a plane surface. If K is the height of the flat surface of the drop, and k that of the point where its tangent plane is vertical, then

$$T = \frac{1}{2} (K - k)^2 g \rho.$$

Surface-Tensions of Liquids at their Point of Solidification. From Quincke.

Substance.	Temperature of Solidification.	Surface-Tension.
Platinum	2000° C.	1653

Quincke finds that for several series of substances the surface-tension is nearly proportional to the density, so that if we call $(K - k)^2 = \frac{2T}{g\rho}$ the specific cohesion, we may state the general results of his experiments as follows :—

The bromides and iodides have a specific cohesion about half that of mercury. The nitrates, chlorides, sugars, and fats, as also the metals, lead, bismuth, and antimony, have

a specific cohesion nearly equal to that of mercury. Water, the carbonates and sulphates, and probably phosphates, and the metals, platinum, gold, silver, cadmium, tin, and copper have a specific cohesion double that of mercury. Zinc, iron, and palladium, three times that of mercury, and sodium, six times that of mercury.

RELATION OF SURFACE-TENSION TO TEMPERATURE.

It appears from the experiments of Brunner and of Wolf on the ascent of water in tubes that at the temperature t° centigrade

$$\begin{aligned} T &= 75.20 (1 - 0.00187t) \text{ (Brunner);} \\ &= 76.08 (1 - 0.002t + 0.00000415t^2), \text{ for a tube } .02316 \text{ cm. dia-} \\ &\quad \text{meter (Wolf);} \\ &= 77.31 (1 - 0.00181t), \text{ for a tube } .03693 \text{ cm. diameter (Wolf).} \end{aligned}$$

CAPIS, or CAPIZ, a town of the Philippine Islands, in a province of the same name, on the north coast of Panay, at the mouth of the rivers Panay, Panitan, and Ivisan, which are subject to inundations during the rainy season. It is the seat of a Spanish alcalde, and is defended by a small fort. Most of its buildings are light erections of nipa palm. Its exports are mainly rice, dyewood, gold-dust, and cattle. Population, 11,470. Lat. $11^{\circ} 25' N.$, long. $122^{\circ} 45' E.$

CAPISTRANO, GIOVANNI DI (1386-1456), was born at the little town of Capistrano in the Abruzzi. He was educated for the profession of law, and till about his thirtieth year was engaged in practice as an advocate. He then entered the Franciscan order, and became one of its most rigid and devoted adherents. At the same time he manifested very remarkable powers as a popular preacher, and was consequently employed on various missions by the popes. In 1450 he was sent by Nicholas V. to Germany to preach against the Hussite heresy, and at the same time to excite the Germans to a crusade against the Turks who, under their great leader, Mahomet II., were threatening to overrun Europe. Capistrano did much to repress the Hussite movement, and though he failed to excite a crusade against the Turks, his religious enthusiasm sustained the inhabitants of Belgrade when that town was besieged by the Turkish forces in 1456. He accompanied them with the cross in his hand in their successful sortie, a few months before his death. He was canonized in 1690.

CAPITAL, in social discussions sometimes treated as antithetical to Labour, is in reality the accumulated savings of labour and of the profits accruing from the savings of labour. It is that portion of the annual produce reserved from consumption to supply future wants, to extend the sphere of production, to improve industrial instruments and processes, to carry out works of public utility, and, in short, to secure and enlarge the various means of progress necessary to an increasing community. It is the increment of wealth or means of subsistence analogous to the increment of population and of the wants of civilized man. Hence Mr Mill and other economists, when seeking a graphic expression of the service of capital, have called it "abstinence." The labourer serves by giving physical and mental effort in order to supply his means of consumption. The capitalist, or labourer-capitalist, serves by abstaining from consumption, by denying himself the present enjoyment of more or less of his means of consumption, in the prospect of a future profit. This quality, apparent enough in the beginnings of capital, applies equally to all its forms and stages; because whether a capitalist stocks his warehouse with goods and produce, improves land, lends on mortgage or other security, builds a factory, opens a mine, or orders the construction of machines or ships, there is the element of self-deprivation for the present, with the risk of ultimate

Sir W. Thomson has applied the principles of Thermodynamics to determine the thermal effects of increasing or diminishing the area of the free surface of a liquid, and has shown that in order to keep the temperature constant while the area of the surface increases by unity, an amount of heat must be supplied to the liquid which is dynamically equivalent to the product of the absolute temperature into the decrement of the surface-tension per degree of temperature. We may call this the *latent heat of surface-extension*.

It appears from the experiments of Brunner and Wolf that at ordinary temperatures the latent heat of extension of the surface of water is dynamically equivalent to about half the mechanical work done in producing the surface-extension. (J. C. M.)

loss of what is his own, and what, instead of saving and embodying in some productive form, he might choose to consume. On this ground rests the justification of the claims of capital to its industrial rewards, whether in the form of rent, interest, or profits of trade and investment.

To any advance in the arts of industry or the comforts of life, a rate of production exceeding the rate of consumption, with consequent accumulation of resources, or in other words, the formation of capital, is indispensable. The primitive cultivators of the soil, whether those of ancient times or the modern pioneers who have formed settlements in the forests of the New World, soon discovered that their labour would be rendered more effective by implements and auxiliary powers of various kinds, and that until the produce from existing means of cultivation exceeded what was necessary for their subsistence, there could be neither labour on their part to produce such implements and auxiliaries, nor means to purchase them. Every branch of industry has thus had a demand for capital within its own circles from the earliest times. The flint arrow-heads, the stone and bronze utensils of fossiliferous origin, and the rude implements of agriculture, war, and navigation, of which we read in Homer, were the forerunners of that rich and wonderful display of tools, machines, engines, furnaces, and countless ingenious and costly appliances, which represent so large a portion of the capital of civilized countries, and without the pre-existing capital could not have been developed. Nor in the cultivation of land, or the production simply of food, is the need of implements, and of other auxiliary power, whether animal or mechanical, the only need immediately experienced. The demands on the surplus of produce over consumption are various and incessant. Near the space of reclaimed ground, from which the cultivator derives but a bare livelihood, are some marshy acres that, if drained and enclosed, would add considerably in two or three years to the produce; the forest and other natural obstructions might also be driven farther back with the result, in a few more years, of profit; fences are necessary to allow of pasture and field crops, roads have to be made and farm buildings to be erected; as the work proceeds more artificial investments follow, and by these successive outlays of past savings in improvements, renewed and enhanced from generation to generation, the land, of little value in its natural state either to the owner and cultivator or the community, is at length brought into a highly productive condition. The history of capital in the soil is substantially the history of capital in all other spheres. No progress can be made in any sphere, small or large, without reserved funds possessed by few or more persons, in small or large amounts, and the progress in all cases is adventured under self-deprivation in the meanwhile of acquired value, and more or less risk as to the final result.

Capital is necessarily to be distinguished from money, with which in ordinary nomenclature it is almost identical. It is impossible to draw any line where capital may not operate actively without the intervention of money. A farmer, manufacturer, or artisan, who has saved from his consumption and expenses of the past year an amount of product-value, may in the following year either employ more labour to direct production or divert a portion of the labour hitherto employed to an improvement of his process, which in either case would be an investment of capital. Money, strictly speaking, is the gold and silver coins in circulation and banking reserve, and its sum in the United Kingdom may amount to over 100 millions sterling. But when the bank deposits of the kingdom are taken into account, they are found to be fives of hundreds of millions sterling, all active as money, and forming what is called the "floating capital" of the country. The explanation is that the farmer, manufacturer, and artisan already supposed, having a surplus produce to dispose of, sell it at what they deem the proper time for their advantage and put the proceeds in bank; or the domestic servant or labouring man having a surplus from his wages, or the investor or speculator in stocks and shares having realized a profit, or the owner of a thousand acres, or the millionaire embarrassed with the returns of a capital so large that he can only add to it year after year, do the same thing—the money employed in these multiplied transactions being merely the vehicle of their notation in money-value, and after accomplishing one series of transactions being available for another series following. The deposits thus made to the banks may be recalled soon or late, in whole or in part, or may go on increasing under the same names for a generation; but, in any case, they are the realized money-values of commodities, wages, rents, interest, and profits, of which the owners had no present need, and which they placed at the service of the public in this social form at some rate of interest until such time as they might choose or need to recall them. This is capital in its most vitalized form, because it is offered through the banks to all who want capital and can give the requisite securities of document or character for its repayment. In proportion as this fund increases a country may be safely deemed richer in resource for the extended employment of labour in all profitable branches of industry, and for coping with every exigency in its industrial and commercial condition. It is a necessary element of all great enterprises, such as railways, telegraphs, lines of ocean steamers, and the like, as well as of operations in foreign commerce where there is a long train of outlays in materials, wages, and charges before there can be any return. Still the idea of capital cannot be confined to money and bank deposits of money. The indefinite extent to which, in the practical conduct of trades and industries, the capital is insensibly increased out of the resources of the business itself, without loans or contribution of new capital shares, and the facility with which property and commodities command the energy of free and active capital, forbid any narrow definition. The capital of a country can scarce be said to be less than the whole sum of its investments in a productive form, and possessing a recognized productive value.

The distinction of "fixed" and "circulating" capital by the author of the *Wealth of Nations* (book ii. c. i.) cannot fail to be always useful in exhibiting the various forms and conditions under which capital is employed. Yet the principal phenomena of capital are found to be the same, whether the form of investment be more or less permanent or circulative. The machinery in which capital is "fixed," and which yields a profit without apparently changing hands, is in reality passing away day by day, until it is worn out, and has to be replaced. So also of

drainage and other land improvements. When the natural forests have been consumed and the landowners begin to plant trees on the bare places, the plantations while growing are a source of health, shelter, and embellishment—they are not without a material profit throughout their various stages to maturity—and when, at the lapse of twenty or more years, they are ready to be cut down, and the timber is sold for useful purposes, there is a harvest of the original capital expended as essentially as in the case of the more rapid yearly crops of wheat or oats. The chief distinction would appear to rest in the element of time elapsing between the outlay of capital and its return. Capital may be employed in short loans or bills of exchange at two or three months, in paying wages of labour for which there may be return in a day or not in less than a year or more, or in operations involving within themselves every form of capital expenditure, and requiring a few years or ninety-nine years for the promised fructification on which they proceed. But the common characteristic of capital is that of a fund yielding a return and reproducing itself whether the time to this end be long or short. The division of expenditure or labour (all expenditure having a destination to labour of one kind or another) into "productive" and "unproductive" by the same distinguished authority (book ii. c. 3) is also apposite both for purposes of political economy and practical guidance, though economists have found it difficult to define where "productive expenditure" ends and "unproductive expenditure" begins. Adam Smith includes in his enumeration of the "fixed capital" of a country "the acquired and useful abilities of all the inhabitants;" and in this sense expenditure on education, arts, and sciences might be deemed expenditure of the most productive value, and yet be wanting in strict commercial account of the profit and loss. It must be admitted that there is a personal expenditure among all ranks of society, which, though not in any sense a capital expenditure, may become capital and receive a productive application, always to be preferred to the grossly unproductive form in the interest both of the possessors and of the community.

These remarks have probably indicated with sufficient clearness the origin, nature, and uses of capital. The subject in its details is full of controversies, on which it would be out of place here to enter. It may be enough to indicate simply some conclusions which appear to be fully established. 1. Capital is not a prerogative or monopoly of any class, but embraces both in its actual form and its future possibilities all classes of men from the humblest labourer to the millionaire. 2. In proportion as capital increases the rate of profit falls, the competition of capital with capital being fully more close and active than that of labour with labour (J. S. Mill's *Principles of Political Economy*, book iv. c. 4). 3. The amount of the annual produce falling to capital is necessarily larger in proportion to the amount falling to labour in countries where the capital is large than in those where it is relatively small, in old than in new countries, though the rate of profit may be lower in the former than in the latter. The rate of profit may fall over the whole capital of a country, and yet from the increase of capital employed the aggregate profit be undiminished or even increased. M. Bastiat puts this conclusion in the following formula:—"In proportion to the increase of capital the *absolute* share of the total product falling to the capitalist is augmented and his *relative* share is diminished; while, on the contrary, the labourer's share is increased both absolutely and relatively" (*Harmonies of Political Economy*, vii.) 4. Capital, so far from being the antagonist, is the ally of labour, the indispensable means of all extended employment and reward of labour, as well

as of all increase of population and civilized well-being (*Some Leading Principles of Political Economy*, by Professor Cairnes, part ii. c. 3).

CAPITANATA, or **FOGGIA**, a province of Southern Italy, formerly belonging to the kingdom of Naples. It has an area of 2955 square miles, and is bounded on the N. and E. by the Adriatic Sea, on the S.E. by the province of Bari, on the S. by Basilicata and Principato Ulteriore, on the W. by Benevento and Molise. The south-west of the province is occupied by the slopes and underfalls of the Apennines, and on the north-east the mountain mass of Gargano covers an extent of more than 800 square miles. The central district, however, is very level, and is known as the Tavogliere di Puglia, or Chess-board of Apulia; while the mountainous parts also enclose many fertile valleys. Except at the promontory of Gargano the coast is low, and is in many parts covered with lagoons, of which the principal are the Lago di Lesina, the Lago di Verana, and the Lago di Salpi. The harbours are few and unimportant. The Fortore, the Candelaro, and the Cervajo are the chief rivers, to which must be added the Ofanto, which forms the boundary towards the south. The products are wheat, maize, pulse, fruits, hemp, flax, oil, and wine; the breeding of horses and cattle is pursued to a considerable extent, and vast herds of sheep are pastured throughout the province. The manufactures are few and of no great importance; and the commerce consists mainly in the coasting trade. The province is divided into the three districts of Foggia, San Severo, and Manfredonia; its capital is Foggia, and the other principal towns, besides those which give name to the districts, are Lucera, Bovino, Cerignola, Ascoli di Satriano, and Vieste. Population in 1871, 322,758.

CAPITO, or **KOEPFLIN**, **WOLFGANG FABRICIUS** (1478–1541), a Reformed divine, was born of humble parentage at Hagenau in Alsace. He was educated for the medical profession, and he also devoted some time to the study of law, in which he gained the degree of doctor. At the same time he applied himself so earnestly to theology that he received the doctorate in that faculty also, and taught for some time at Freiburg. He acted for three years as pastor in Bruchsal, and was then called to the cathedral church of Basel. In 1520 he removed to Mainz, at the request of Albrecht, archbishop of that city. In 1523 he settled at Strasburg, where he remained till his death. He took a prominent part in the earlier ecclesiastical transactions of the 16th century, was present at the second conference of Zurich and at the conference of Marburg, and along with Bucer was appointed to present to the emperor the confession of Augsburg. From his endeavours to conciliate the Lutheran and Zwinglian parties in regard to the sacraments, he seems to have incurred the suspicions of his own friends; while from his intimacy with several divines of the Socinian school he drew on himself the charge of Arianism. His principal works were,—*Institutionum Hebraicarum libri duo*; *Enarrationes in Habacuc et Hoseam Prophetas*; and *Explicatio doctissima in Hexaemeron*.

CAPITOL, the great temple of Jupiter on the Tarpeian or Capitoline Hill at Rome. See **ROME**.

CAPITOLINUS, **JULIUS**, one of a number of historical writers who lived about the end of the 3d century. See **AUGUSTAN HISTORY**, vol. iii. p. 73.

CAPITULARIES are certain laws enacted under the auspices of kings of the Frankish race. They are called *Capitularia*, a name of no classical authority, but derived from *capitulum*, the diminutive of *caput*; and they are so described from the circumstance of their being enacted or digested *capitulatim*, by heads or chapters. The term is very frequently used in a general sense, but in other instances capitularies are distinguished from laws.

The laws of the Franks were enacted “consensu populi

et constitutione regis.” Liberty was the chief inheritance of the ancient people of Germany; nor were they governed by laws which they had no share in enacting. It has been remarked by Dr Stuart, that “the short but comprehensive and sentimental work of Tacitus, on the manners of Germany, is the key to the institutions, the Capitularies, and the code of the barbarians.” But the national assemblies of those who were capable and worthy of bearing arms appear to have been gradually superseded by a select council, composed of the two orders of the clergy and nobility; and if the great body of the people attended their deliberations, it seems to have been more in the capacity of spectators than of actual legislators. The initiative in promulgating any resolution was always taken by the king or emperor, and the final adoption seems also to have been very much in his hands, the assembled magnates merely giving their advice on the circumstances of the case. This was the form of the constitution in the time of Charlemagne, in whose name a great proportion of the Capitularies are promulgated, though some of them belong to a more recent, and others to a much more early period, the collection commencing with an enactment of King Childebert, dated in the year 554. The Capitularies are written in the Latin language, and were doubtless drawn up by the ecclesiastics. The Latin copies were deposited among the national archives, but the laws were divulged to the people in their mother tongue.

Savigny gives the following summary of what is now known with regard to the Capitularies:—“The imperial ordinances of the Franks (*Capitularia*), which, after the extension of their empire, were distinguished from the national laws (*Leyes*), arose from the enlargement of the same principle. All royal enactments, particularly in later times, were called *Capitularia*, or *Capitula*. The king had a double character,—the one, as chief of each individual tribe, and the other as head of the whole nation. Hence the Capitularies also are of two classes,—those defining the law of a particular race, e.g., ‘*Capitula addita ad Legem Salicam*,’ and those of general application over the whole Frank territory. In the kingdom of the Franks, with which so many different nations were incorporated, the Capitularies are so frequently general under the Carolingian dynasty, that when their character is not specially fixed they may be understood as belonging to that class. In Lombardic Italy, on the contrary, where the Lombards and Romans were the only distinct peoples, most of the ordinances of Charles and his successors must be understood as constituting exclusively Lombardic law. For this reason probably they have been inserted in all the early collections of that law, and were consequently never obligatory on the Romans. It is, however, of great importance to determine accurately the limits of the general Capitularies. The laws of the race of Charlemagne have been erroneously supposed to apply to all the subjects of their extensive empire. These princes reigned over three distinct kingdoms, the Frankish, the Lombardic, and that which under the name of Rome and the Exarchate had recently constituted part of the Greek empire. No Capitulary, however general, could overstep the boundaries of that state in which it had originated. The only exceptions to this rule were some clerical laws; and their universal validity arose from the unity of the church, and from the common old ecclesiastical authorities, on which they were founded. No example of a similarly general application is found in any of the temporal ordinances.”

The first collection of the Capitularies was made in the 9th century by Angersise, abbot of Fontenelle, one of the counsellors of Charlemagne. He collected the *Capitula* of Charlemagne and Louis le Debonnaire into four books. In 842 Benedict, deacon of Mainz, added three books, bringing up the number of *Capitula* to 1697. Supplements were afterwards added, which increased the number to

2100. The history of the later editions will be found in the preface of Baluze, who has himself surpassed all preceding and all subsequent editors. His great collection appeared under the following title: *Capitularia Regum Francorum; additæ sunt Marculfi monachi et aliorum formulæ veteres, et notæ doctissimorum virorum: Stephanus Baluzius Tutelenis in unum collegit, ad vetustissimos codices manuscriptorum emendavit, magnam partem nunc primum edidit, notis illustravit*, Paris, 1677, 2 tom. fol. This valuable work was long afterwards reprinted in Italy (Venetiis, 1771, 2 tom. fol.) Another edition, for which Baluze had himself made preparations, is that of De Chinia, which appeared at Paris, 1780, 2 tom. fol. This edition is splendidly printed, but is somewhat disfigured by a French translation of the preface, exhibited column for column. The Capitularies are also to be found in Georgisch's *Corpus Juris Germanici antiqui*, Halle Magd. 1738, 4to; in Canciani's *Leyes Barbarorum antiquæ*, Venetiis, 1781-91, 5 tom. fol.; in Walter, *Corpus Juris German. antiq.*, 1823-4; and in Pertz, *Monumenta Germanica*. An admirable analysis of the contents of the Capitularies will be found in Guizot, *His. de la Civilization*, Læq. xxi. and xxv. See also Michelet, *Origines du Droit Français*.

CAPITULATION (the *Pactum deditiois* of Grotius) is an agreement in time of war for the surrender to a hostile armed force of a particular body of troops, a town, or a territory. It is an ordinary incident of war, and therefore no previous instructions from the captor's Government are required before finally settling the conditions of capitulation. The most usual of such conditions are freedom of religion, and security of private property on the one hand, and a promise not to bear arms within a certain period on the other. Such agreements may be rashly concluded with an inferior officer, on whose authority the enemy are not in the actual position of the war entitled to place reliance. The Roman consuls sometimes introduced the condition—"Ita ratum sit, si populus Romanus censuisset." Saturninus surrendered the Capitol on the promise of Marius; but Cicero asks (*pro C. Rab.*, c. x.), "Fides qui potuit sine senatusconsulto dari?" Cæsar evidently thought that responsibility in such matters should rest in the commander-in-chief: "Alter agere ad præscriptum, alter libere ad summam rerum consulere debet" (*de B. C.*, iii. 51). In modern times the question has been raised whether a capitulation can ever amount to a conveyance of the sovereignty, or a perpetual cession of political allegiance. Such matters are fixed by the terms of peace; but before then questions may rise as to rights in the property passed by capitulation. Although private ransoms are theoretically allowed by English admiralty law in cases of necessity, the Prize Act (27 and 28 Vict. c. 25, § 45) confers a right only to ships and goods afloat. Hence part of the consideration of a capitulation may be condemned to the Crown. Again, as in the case of Thorshaven and its dependencies (Island of Stromoe), which capitulated to Captain Baugh in 1808, public property passed by the capitulation, if not taken possession of by the private enemy, may afterwards be seized by privateers and forfeited to the Crown. In two great capitulations of modern history, Great Britain has made a not very creditable appearance. That of Closter Seven, between the duke of Cumberland and Marshal Richelieu for a suspension of arms in N. Germany, King George, as elector of Hanover, refused to ratify, and ordered the *Hanoverian* troops, which ought to have been disbanded, to resume service as *British* troops. In the capitulation of El Arish (1800), which related to the evacuation of Egypt by the French, the British Government, so long as it seemed more advantageous to fight, pleaded a defect in the authority of Sir Sidney Smith; but when Kleber's brilliant movement to Heliopolis had changed matters, they clamoured for the faithful execution of the agreement. The most important case on the subject of capitulation is, however, that of the merchants of Genoa, particulars of which may be got in *Hansard*, vol. xxx., and 4 *Robinson*, 388.

Capitulation is also the name given to an arrangement

by which a body of foreigners enjoy certain privileges within the state making the capitulation; e.g., the Swiss Guards at the Tuileries, or the consular jurisdictions in the Levant. It is also applied by French writers to the oath which on his election the emperor of the Romans used to make to the college of electors; this related chiefly to such matters as regalian rights, appeals from local jurisdictions, the rights of the Pope, &c.

CAPMANY, ANTONIO DE MONTPALAN Y (1743-1813), a Spanish historian and philosopher, was born at Barcelona. He spent the early part of his life in military service, and after his retirement in 1770 removed to Madrid, where he was elected secretary of the Royal Academy of History. His principal works are,—*Memorias historicas sobre la Marina, Comercio, y Artes de la antigua ciudad de Barcelona*, 4to, Madrid, 1779-1792; *Tratado historico-critico de la Eloquencia Española*, 4to, Madrid, 1786; *Diccionario Frances-Español*, 4to, Madrid, 1805; *Filosofia de l'Eloquencia*, 1776; and *Questiones criticas sobre varios puntos de historia economica, politica, y militar*, 8vo, 1807.

CAPO D'ISTRIA, a fortified seaport town of Austria, in the government of Trieste and circle of Istria. It stands on a small island in the Gulf of Trieste, 8 miles south of that city, in 45° 32' 20" N. lat. and 13° 42' 29" E. long., and is connected with the mainland by a causeway half a mile in length. It is the seat of a bishopric, and has a cathedral and about thirty other churches, a citadel, a gymnasium, a prison, and a theatre. It manufactures salt, sugar, leather, and soap; it also exports wine, oil, and fish. The harbour is large, but is little frequented except by fishing-boats. Population in 1869, 9169. Capo d'Istria is usually identified with the town of Ægida, mentioned by Pliny, which appears by an inscription to have afterwards received the name of Justinopolis from Justin II. At a later period it formed a free commonwealth, which was subjugated by the Venetians in the 10th century, fell into the hands of the Genoese in 1380, and was recaptured by the Venetians in 1487. As capital of Istria it passed into Austrian possession in 1797.

CAPO D'ISTRIA, JOHN, COUNT (1780-1831), was born at Corfu, where his father was a physician, in 1780. At first he devoted himself to the study of medicine in the academies of Padua and Venice, but joined the Russian diplomatic service when at the treaty of Tilsit the Ionian Islands were ceded to the French. He held the office of secretary for foreign affairs under the Emperor Alexander, and was president of the Greek republic after the battle of Navarino. Having been suspected of treachery to the republican cause, he was assassinated when entering a church at Nafplia, October 9, 1831. See GREECE.

CAPPADOCIA, an extensive province of Asia Minor, that for a considerable period constituted an independent kingdom. It was originally a country of much greater extent; in the time of Herodotus, the Cappadocians occupied the whole region from the chain of Mount Taurus on the south to the shores of the Euxine. That author tells us that the name of Cappadocians was that applied to them by the Persians, while they were termed by the Greeks Syrians, or White Syrians (*Lencosyri*). The fact that they were a branch of the same race with the Syrians appears indeed to admit of no doubt. Under the Persian empire they were divided into two separate satrapies or governments, the one comprising the central and inland portion of the country, to which the name of Cappadocia continued to be applied, while the other was called Cappadocia ad Pontum, and gradually came to be known simply as Pontus. As after the fall of the Persian government the two provinces continued to be subject to separate rulers, this distinction was perpetuated, and the name of Cappadocia came to be restricted to the inland province

(sometimes called Great Cappadocia), which alone will be considered in the present article. The history and geography of the region bordering on the Euxine will be found under PONTUS.

Cappadocia, in this sense, was bounded on the S. by the chain of Mount Taurus, on the E. by the prolongation of that ridge and the Euphrates, on the N. by Pontus, and on the W. by Galatia and Lycaonia. But it had no natural boundaries except on the south and east, so that it is impossible to define its limits with accuracy on the other sides. Strabo is the only ancient author who gives any circumstantial account of the country, but he has greatly exaggerated its dimensions; it was in reality about 250 miles in length by less than 150 in breadth. With the exception of a narrow strip of the district called Melitene, on the east, which forms part of the valley of the Euphrates, the whole of this extensive region is a high upland tract, attaining to the level of more than 3000 feet above the sea, and constituting the central and most elevated portion of the great table-land of Asia Minor. (See ASIA MINOR.) The western parts of the province, where it adjoins Lycaonia, and extending thence to the foot of Mount Taurus, are open treeless plains, affording pasture in modern as well as ancient times to numerous flocks of sheep, but almost wholly desolate and uncultivated. But out of the midst of this great upland level rise detached groups or masses of mountains, mostly of volcanic origin, of which the loftiest is Mount Argæus (still called by the Turks Erdjish Dag), which attains to a height of 13,000 feet above the sea, while that of Hassan Dag to the south-west of it rises to about 8000 feet.

The eastern portion of the province is of a more varied and broken character, being traversed by the mountain-chain called by the Greeks Anti-Taurus, as well as by several subordinate ridges, some of them parallel with it, others extending eastwards from thence towards the Euphrates. Between these mountains and the southern chain of Taurus properly so called lies the region called in ancient times Cataonia, occupying an upland plain in a basin surrounded on all sides by mountains. This district in the time of Strabo formed a portion of Cappadocia, and though several ancient writers had regarded the Cataonians as a distinct people from the Cappadocians, Strabo, who had himself visited the country, could find no distinction between them either in language or manners.

The River Pyramus (now called the Jihun) rises in the table-land of Cataonia, and forces its way through narrow and rocky defiles across the chain of Taurus to the plains of Cilicia. The Sarus, or Sihun, rises much farther north, in the Anti-Taurus, near the frontiers of Pontus, and flows through a deep and narrow valley between two parallel ridges of mountains, for a distance of more than 150 miles, till it in like manner forces its way through the main range of the Taurus, and emerges into the plains of Cilicia. The Halys, or Kizil Irmak, which has its sources within the confines of Pontus, traverses the northern part of Cappadocia throughout its whole extent, passing within about 20 miles of the capital city of Kaisariyeh. The other rivers of Cappadocia are of little importance.

The kingdom of Cappadocia, which was still in existence down to the time of Strabo, as a nominally independent state, was divided, according to that geographer, into ten districts, viz., Melitene, Cataonia, Cilicia, Tyanitis, and Garsauritis in the south, or adjoining Mount Taurus; and five others, Laviniasene, Sargarausene, Saravene, Chamanene, and Morimene, on the side of Pontus. The position and limits of these northern subdivisions cannot be determined with any certainty, but the others are better known. Cataonia has been already described, and the adjoining district of Melitene, which did not originally

form part of Cappadocia at all, but was annexed to it by Ariarathes I., was a fertile tract adjoining the Euphrates, the chief town of which still retains the name of Malatiyeh. Cilicia was the name given to the district in which Cæsarea, the capital of the whole country, was situated, and in which rose the lofty and conspicuous mass of Mount Argæus. Tyanitis, as its name shows, was the region of which T yana was the capital,—a level tract in the extreme south of the province, extending quite to the foot of Mount Taurus. Garsauritis appears to have comprised the western or south-western districts adjoining Lycaonia; its chief town was Archelais, now Ak Serai.

The only two cities of Cappadocia in the days of Strabo which were considered by the geographer to deserve that appellation were—Mazaca, the capital of the kingdom under its native monarchs, but which, after it had passed under the Roman government, obtained the name of Cæsarea, which it has ever since retained under the scarcely altered form of Kaisariyeh; and T yana, not far from the foot of the Taurus, the site of which is marked by some ruins at a place called Kiz Hissar, about 12 miles south-west of Nigdeh. Archelais, founded by Archelaus, the last king of the country, subsequently became a Roman colony, and a place of some importance. At the present day the only considerable town in this part of Asia Minor is Kaisariyeh, which has a population of about 25,000 souls, and is an important centre of trade, and the resort of merchants from all parts of Asia Minor, as well as Syria and Armenia.

The ancient Cappadocians were much devoted to the practice of religious and superstitious rites, and several localities in their country were the sites of temples that enjoyed a great reputation for sanctity. Among these the most celebrated was that of Comana, dedicated to the goddess Mā, whom the Greeks identified with Enyo, the Bellona of the Romans, and the same deity who was worshipped at the Pontic Comana. The high-priest enjoyed consideration second only to the king, and exercised rule over the greater part of Cataonia, of which Comana was the chief place. It was situated on the river Sarus, but the site has not been identified. Next to him ranked the high-priest of Zeus at Vemasa, in Morimene, which had not less than 3000 slaves. The temple of Artemis Perasia at Castabala also enjoyed a great reputation of sanctity. Cappadocia was remarkable for the number of slaves, which constituted indeed the principal wealth of its monarchs. They were sent in large numbers to Rome, but did not enjoy a good reputation. The province was also celebrated for the number and excellence of its horses, as well as for its vast flocks of sheep; but from its elevation above the sea, and the coldness of its climate, it could never have been a rich and fertile country.

History.—Nothing is known of the history of Cappadocia before it became subject to the Persian empire. It was included in the third satrapy of that empire in the division established by Darius, but continued to be governed by satraps or rulers of its own, who apparently retained the title of kings. These derived their descent from a Persian named Anaphas, who was one of the seven conspirators that slew the false Smerdis. The first ruler who succeeded in establishing himself in a position of virtual independence was Ariarathes (hence called Ariarathes I.), who was a contemporary of Alexander the Great, and maintained himself on the throne of Cappadocia after the fall of the Persian monarchy.

After the death of Alexander, Perdiccas, marching into Cappadocia with a powerful and well-disciplined army, succeeded in taking Ariarathes prisoner, and crucified him and all those of the royal blood who fell into his hands. His son Ariarathes II., however, having escaped the general

The new prince found himself immediately engaged in war with Nicomedes ; but, being assisted by Mithridates, he not only drove him out of Cappadocia, but stripped him of a great part of his hereditary dominions. On the conclusion of the peace, the refusal of Ariarathes to reward Gordius, the murderer of his father, led to a war with Mithridates. When the two armies met on the frontier of Cappadocia, Mithridates invited Ariarathes to a conference, and openly stabbed him with a dagger which he had concealed in his dress. The terror-stricken Cappadocians immediately dispersed, and submitted to the yoke of Mithridates ; but, unable to endure the tyranny of his prefects, they quickly rose in rebellion, and recalling the exiled brother of the late king they placed him on the throne. He had scarcely ascended the throne when Mithridates invaded the kingdom at the head of a numerous

Ariobarzanes II. proved no less faithful to the Romans than his father had been. On the breaking out of the civil war between Cæsar and Pompey he sided with the latter; but after the death of Pompey he was received into favour by Cæsar, who bestowed upon him a great part of Armenia. While the dictator was engaged in war with the Egyptians, Pharnaces, king of Pontus, invaded Cappadocia and stripped Ariobarzanes of all his dominions; but Cæsar, after defeating Pharnaces, restored the king of Cappadocia, and honoured him with new titles of friendship. After the murder of Cæsar, Ariobarzanes, refusing to join Brutus and Cassius, was declared an enemy to the republic, and was soon afterwards taken prisoner and put to death (42 B.C.) His brother, Ariarathes IX. was then for a few years raised to the throne, but was in his turn put to death by Antony, and with him the royal family became extinct. Archelaus, the grandson of the general of the same name, commanded against Sulla in the Mithridatic war, owed his elevation to the throne of Cappadocia solely to the whoges of his mother Glaphyra with Mark Antony, to his &c remained faithful in the contests with Augustus. intrigue whom h

On the defeat of Antony, he was pardoned by the emperor at the intercession of the Cappadocians, and received Armenia Minor and Cilicia Trachea as a reward for having assisted the Romans in clearing the seas of pirates who infested the coast of Asia. He contracted a strict friendship with Herod the Great, king of Judea, and married his daughter Glaphyra to Alexander, Herod's son. On the accession of Tiberius (who entertained a secret hostility to Archelaus on account of his previous neglect of his merits during the lifetime of Caius Caesar), he was decoyed to Rome by the fair promises of Livia, the emperor's mother; but being accused before the senate, and loaded with reproaches at the court, he died of grief, after a reign of fifty years.

On the death of Archelaus (17 A.D.) the kingdom of Cappadocia was reduced to a Roman province, and governed by men of the equestrian order. It continued under the Roman empire to enjoy a high state of prosperity, and its capital, Caesarea, became a great and flourishing city. But in the reign of Valerian, it was overrun by the Persian king Sapor, who took Caesarea after a long siege, and put most of the inhabitants to the sword. Cappadocia, however, continued to form part of the Byzantine empire, till it was conquered by the Seljukian Turks in 1071. It has ever since remained incorporated with the Turkish empire.

During the Roman period Cappadocia assumes rather a prominent part in ecclesiastical history. Its capital, Caesarea, was the birthplace of St Basil, who long occupied its episcopal see, while that of Nyssa was held by his brother Gregory; and the small town of Nazianzus, in the south-west of the province, was at once the birthplace and the residence of the more celebrated Gregory, commonly known from thence as St Gregory Nazianzen. (N. N. N.)

CAPPEL, the name of a family of distinguished theologians, scholars, and juriconsults, of whom the following are the most important. Guillaume Cappel, in 1191, as rector of the university of Paris, had the boldness to forbid the payment of the tithe demanded by Pope Innocent VIII. His son Jacques, juriconsult and councillor of state under Francis I., is famous for the speech which he delivered in 1537 before the king and nobility of France against Charles V. and the counts of Flanders, Artois, and Charolais. His son, Louis Cappel, sieur de Moniambert (1531–1586), who began life as professor of Greek at Bordeaux, and ended his days as professor of theology at Sedan, is remarkable for his devotion to the cause of Protestantism, for the sake of which he risked his life on more than one occasion. It was he who, in 1560, presented to Charles IX. the Confession of Faith which had been drawn up by the Parisian Protestants. Another son, Jacques Cappel (1570–1621), was a distinguished juriconsult. He was the father of Jacques Cappel, author of a number of works of considerable celebrity on theology, history, philology, and antiquities, and of Louis Cappel, noticed below.

CAPPEL, Louis, the most celebrated member of the above family, a learned Protestant theologian and scholar, was born at St Elien in 1585, and died at Saumur in 1658. He studied theology at Sedan, Oxford, and Saumur. At the age of twenty-eight he accepted the chair of Hebrew at Saumur, and twenty years after that of theology. As a Hebrew scholar, his greatest achievement is his demonstration, against the Buxtorfs, that the vowel points and accents are not an essential part of the Hebrew language, but were inserted by the Masorete Jews of Tiberias, not earlier than the 5th century A.D., and that the primitive Hebrew characters are those now known as the Samaritan, while the square characters are Chaldean, substituted for the more ancient at the time of the Captivity. As a theologian, he advocated liberal views with regard to the verbal inspira-

tion of Scripture and the history of the Bible. These doctrines of Cappel were generally distasteful to his co-religionists. Their protest against the Church of Rome being founded upon Scripture, to allow the possibility of the slightest inaccuracy in its text seemed to them to be striking at the very root of their position. They, therefore, made strenuous efforts to prevent the publication of his views. The Swiss clergy were compelled to sign a paper condemning them, and Cappel found great difficulty in printing some of his works. His *Critica Sacra*, a collection of various readings in the Old Testament and of canons of textual criticism, lay in MS. for ten years, and he was only able to print it at Paris, in 1650, by aid of a son who had turned Catholic. Cappel is also the author of *Annotationes et Commentarii in Vetus Testamentum*, *Chronologia Sacra*, and other theological works, as well as of several treatises on Hebrew besides the *Critica Sacra*, among which are the *Arcanum Punctuationis revelatum* (1624), and the *Diatriba de veris et antiquis Ebraeorum literis* (1645). His *Commentarius de Capellorum gente*, giving an account of the distinguished family to which he belonged, was published by his nephew James Cappel (1639–1722), who, at the age of nineteen, became professor of Hebrew at Saumur, but, on the revocation of the edict of Nantes, fled to England, where he died in 1622.

CAPPERONIER, CLAUDE (1671–1744), a classical scholar, was the son of a tanner at Montdidier. He studied at Amiens and Paris, and took orders in the Church of Rome, but devoted himself almost entirely to classical studies. He declined a professorship in the university of Basel, and was afterwards appointed to the Greek chair in the Collège de France. He published an edition of Quintilian, and left behind him at his death an edition of the ancient Latin Rhetoricians, which was published in 1756. His nephew, Jean Capperonier, was also a famous linguist.

CAPRERA, or CAPRERA, a small island of Italy, in the Mediterranean, two miles off the north-east coast of Sardinia, in 41° 12' 47" N. lat. and 9° 29' 14" E. long. It forms one of the Buccinarian group, and belongs to the province of Sassari. The most of its surface of 6700 aeres is rocky and infertile; and till the present century it was only occasionally visited. In 1854 Garibaldi acquired possession of a part of the island, and built himself a house, which has been his principal place of residence since that date. See Veechj, *Garibaldi at Caprera*, 1862.

CAPRI, the ancient *Capræa*, a small island of Italy on the south side of the Bay of Naples, in 40° 32' N. lat. and 14° 11' E. long., and separated by a space of 3½ miles from the promontory of Sorrento. It is a mass of limestone rock, with an area of about 20 square miles, rising into two distinct peaks or plateaus, with a little valley of great fertility between. The coast consists for the most part of precipitous cliffs, and there are only two landing-places in the whole circuit. The scenery throughout the island is of unusual beauty, and some of the sea-caves are unrivalled for the splendid colours reflected on the rock. The two most famous are called respectively the Blue and the Green Grotto; the former, though it has only become a popular resort in the present century, seems to have been known in the 17th. The inhabitants still retain distinct traces of the Greek type of countenance and figure. They are industrious, religious, and simple, and, in general, poor. Besides the cultivation of the narrow surface that can be reclaimed from the rock, they chiefly depend on the capture of the quails which visit the island in May and December; and about 200 of the young men take part annually in the coral fishery off the coast of Africa. The chief towns are Capri in the east, with 2332 inhabitants, and a beautiful cathedral and a seminary; and Anacapri in the west, situated on the summit of

don, and is in use in a few ships of British and foreign navies. The cable-holder is placed on the fore side of the deck pipe, and is fitted with a grooved pulley M for the cable to pass

FIG. 4.—Cable-holder.

over, similar to the whelps of the capstan shown in fig. 1. It revolves on a horizontal spindle fixed to the deck by brackets. The interior is made hollow, and contains a double series of disks, which can be screwed together by means of a hand-lever L, thereby causing sufficient friction to let the cable run out slowly, or to stop it entirely, and also to hold the ship when riding at anchor. Means have been devised, and are now being fitted in one of the ships of the British navy for connecting these "cable-holders" with the capstan, so that the cable may be hove up by them without taking it to the capstan. (R. M.)

CAPUA, a large and important city of ancient Italy, capital of Campania, was situated in the midst of a very fertile and valuable territory, two miles from the bank of the Volturnus, and about half that distance from the mountain Tifata. Much diversity of opinion has prevailed as to the date of its foundation, and the people by whom it was originally inhabited. It is now generally agreed that Capua was one of the twelve cities which the Tuscans were said to have founded in the south of Italy at the beginning of the 9th century B.C. The city soon rose in importance, and its inhabitants became renowned throughout the whole peninsula for their wealth, and the luxurious magnificence of their lives. In course of time, as was natural, they degenerated so far that, from having been originally a brave and warlike people, they could no longer resist the encroachments of the Samnites, who in 424 B.C. made themselves masters of the city, and put the inhabitants to the sword. The material prosperity of the city remained undiminished under the rule of the Samnites, who in less than a century became as effeminate and degenerate as the Capuans had been. When they in turn were attacked by the mountaineers, they were compelled to apply to Rome for assistance, which was immediately granted. At the close of the Latin war, in which the Capuans had assisted the allies, they were deprived of the *Campanus Ager*, the most valuable district in Italy, but were admitted to take rank as citizens of Rome. They still continued, however, to select their own rulers. When the second Punic war broke out, the Capuans, elated with the prospect of retrieving their high position, opened their gates to Hannibal, who spent an entire winter with his army in the city. To the enervating contagion of Capuan effeminacy historians have always attributed the want of success which subsequently attended the Carthaginian commander in his Italian campaigns. When the Romans at length made themselves masters of the city, in the seventh year of the war, they took a terrible revenge, and only forbore to raze the city to the ground in consideration of the great natural advantages of its site. For its fidelity in the social war, the Romans restored to Capua all its municipal privileges, and the city recovered all its commercial, though it never regained its political importance. Under Julius Cæsar, the *Campanus Ager* was distributed among 20,000 citizens of Rome, and Capua became a Roman colony. Under the emperors it continued to prosper commercially, and it seems to have been as rich and populous at the downfall of the Western empire as during the time of its political independence. Its wealth

marked it out as a special object of attack to the Vandals, who took and nearly destroyed it under Genseric 456 A.D. What was left undone by the Vandals was completed by the Saracens, who burnt the city to the ground in 840. The inhabitants, who had fled for shelter to the neighbouring mountains, returned on the departure of their eastern invaders, and established themselves at Casilinum, a stronghold on the Volturnus two miles distant from their ancient home. Casilinum is the modern Capua, formerly one of the strongest forts in the kingdom of the Two Sicilies. The site of the ancient Capua is now occupied by Santa Maria, a thriving town of 16,000 inhabitants, the seat of the tribunals of the southern division of the province of Terra di Lavoro. Outside Santa Maria, on the north-west, are the extensive remains of the old Capuan amphitheatre, second only to the Flavian amphitheatre in size and magnificence, near which are the remains of a triumphal arch; and other ruins may still be traced within the town and in its immediate neighbourhood, but they are not of much interest.

Granata, *Storia civile della fedelissima città di Capua*, 3 vols., Naples, 1752-56; Rinaldo, *Memorie istor. della città di Capua*, 1755; Rucca, *Capua Velerè*, 1828; Daniele, *Monete antiche di Capua*, 1802.

CAPUCHINS. The Capuchin friars are one branch of the great Franciscan order, and their rule is in all essentials the same as that of the other friars minor, or Minorites. It was in the first decade of the 13th century that St Francis established his order; but it was not till 1528 that a bull of Clement VII. erected into a separate order the disciples of a certain minorite friar, who had conceived that he was inspired to reform the practices of his order in some respects. This man's name was Mathew da Bassi, a Franciscan of the March of Ancona. The legend of the order states that, having seen a representation of St Francis wearing a square-cut pyramidal hood, he made a similar one for himself, sewed it on to his monastic habit and began to wear it. This was in 1525. This audacious innovation drew down on the author of it much blame, and some persecution on the part of his superiors; but as usual in similar cases, that did not prevent others from following his example. Specially two brothers Ludovico and Raffaele of Fossombrone, the first a priest and the second a lay brother of the Franciscan order, joined themselves to Mathew, and underwent punishment from their superiors for so doing. They, however, obtained the countenance and patronage of the Duchess Cibo, a connection of the then reigning Pope Clement VII. (Giulio de' Medici), and the wife of Giorgio Varano, duke of Camerino. That lady gave her protégés a letter of recommendation to the pope, armed with which they went to Rome, and, despite the fact that they were disobedient to their superiors and therefore had broken their monastic vows, obtained from the pope the bull known as *Religionis Zelus*, by which they were permitted to impart their hooded habit to any disciples who might be willing to join them, to live as hermits in wild and desolate places, to go barefoot, to wear beards, and to call themselves "Hermit Friars Minor." The populace, however, gave them a nickname which has supplanted the more formal one. "Cappuccio" is a hood in Italian; and the diminutive "Cappuccino," formed half affectionately, half contemptuously, as is the Italian word, means "little hooded fellow." When this bull had been obtained, a place for the first congregation of the new order was soon found in an abandoned convent at Colmenzone, near Camerino, given to them by the duchess. Disciples thronged to the "new religion," and three other convents were shortly built. Mathew, the disobedient monk who had rebelled against his superiors and abandoned his con-

Frequent reference is made in Greek and Roman literature to the lynx, and from such descriptions as are given of it there is little doubt that the caracal, and not the more northerly species now known as the lyux, was referred to. In South Africa, where the caracal abounds, its hide is made by the Kaffres into skin-cloaks, known as karosses.

CARACALLA, MARCUS AURELIUS ANTONINUS (188–219 A.D.), a Roman emperor, son of the Emperor Septimius Severus, was born at Lyons in 188. His original name, Bassianus, has been entirely dropped in favour, either of the nickname Caracalla (taken from the long hooded tunic which he wore, and introduced into the army), or of the imperial title of Marcus Aurelius Antoninus, which he received at the time when his father declared himself the adopted son of M. Aurelius. Dion Cassius regularly calls him Tarantus, from his resemblance to a certain coarse and bloodthirsty gladiator. The heartless cruelty of his disposition was early displayed in an attempt to assassinate his father; and when, on his father's death, he mounted the throne (211) as colleague of his brother Geta, he did not shrink from murdering him in the presence of his mother, to seize the supreme power, nor from making himself secure by butchering 20,000 persons whom he suspected. It is said that he was, however, unable to rid himself of remorse, and that it was the torment of conscience which drove him to spend the rest of his life in the maddest acts of destruction and bloodshed. He visited Gaul, Germany, France, Egypt, and various parts of Asia, plundering everywhere, and committing the most atrocious crimes. In Alexandria he took vengeance for the sarcasms of the people by a general massacre; and he laid Mesopotamia waste because Artabanus, the Parthian king, refused to give him his daughter in marriage. In 217 he was killed at the instigation of Macrinus, who succeeded him. See ROMAN HISTORY.

CARACAS, a large city of South America, capital of the United States of Venezuela and of the federal district, is situated on the declivity of a mountain 2880 feet above the level of the sea, 16 miles south-south-east of La Guayra, its port on the Caribbean Sea, in 10° 30' N. lat., 67° 4' W. long. Population in 1873, 48,897. The city is finely-situated, and has a temperate and healthy though variable climate. The mean temperature of the year is about 72° Fahr., being in the hot season 75°, and in the cold season 66°. The thermometer, however, sometimes rises to 84° or 85°, and at other times descends as low as 51° or 52°. Rain is abundant during the months of April, May, and June, but not so incessant as in other tropical countries; the rest of the year is rather dry. The city is much subject to earthquakes, from which it has frequently suffered; in that of 1812, 12,000 persons are said to have perished. Caracas is separated from the sea-coast, and from its port of Guayra by the high ridge of the Cerro de Avila, and lies on the western skirt of the plain of Chacao, which has a steep slope from north-north-west to south-south-east. The Guayra, a tributary of the River Tuy, which falls into the ocean thirty-six miles east of Cape Codera, flows past the southern side of the city, and is joined by the streams called the Anaeco, Catuche, and Caroata passing through the town from the north. Two miles east the great double-peaked mountain known as the Silla de Caracas rises to 8600 feet. The Calvario hill, west of the city, was the scene of a battle between the Spaniards and patriots in June 1821. The town is well and regularly built; the streets are wide and well paved, crossing each other at right angles. There are several squares, of which the Plaza Mayor, or great square, is the most worthy of notice. Its east side is principally occupied by the cathedral, the south by the college, and the west by the public prison. This square is a great market for provisions, fruit, and other articles, and contains a sort

of inner square in which are ranges of shops. A reservoir in the ravine of the Catuche to the north furnishes the city with water, which is supplied to the inhabitants by public fountains as well as in pipes. The chief public building is the cathedral, which is 250 feet in length by 75 in breadth, and is supported by twenty-four pillars, without beauty or proportion. It contains the tomb of Bolivar. The university of Caracas, which, with the House of Assembly, the National Library (of 10,000 volumes), and a church, forms one block of the town, was originally a convent of Carmelite friars, and has faculties of divinity, chemistry, and medicine. The Municipal Hall, close to the Grand Plaza, is a plain building, one of the oldest in Caracas. There are several parish churches, three monasteries for friars, two nunneries, three hospitals (one of which is for lepers alone), and a theatre. The city is very inaccessible from the north, in which direction three rough mountain tracks unite it with La Guayra. A railroad is projected to unite Caracas and its port. A railway to the eastward from the city was partly constructed at one time, but was not completed. Caracas was founded by Diego Losada in 1567.

CARACCI, LODOVICO, AGOSTINO, and ANNIBALE, three celebrated Italian painters, were born at Bologna in 1555, 1558, and 1560 respectively. Lodovico, the eldest, son of a butcher, was cousin to the two younger, Agostino and Annibale, sons of a tailor, and had nearly finished his professional studies before the others had begun their education. From being a reputed dunce while studying under Tintoretto in Venice, he gradually rose, by an attentive observation of nature and a careful examination of the works of the great masters preserved at Bologna, Venice, Florence, and Parma, to measure himself with the teachers of his day, and ultimately projected the opening of a rival school in his native place. Finding himself unable to accomplish his design without assistance, he sent for his two cousins, and induced them to abandon their handicrafts (Agostino being a goldsmith, and Annibale a tailor) for the profession of painting. Agostino he first placed under the care of Fontana, retaining Annibale in his own studio; but he afterwards sent both to Venice and Parma, to copy the works of Titian, Tintoretto, and Correggio, on which his own taste had been formed. On their return, the three relatives, assisted by an eminent anatomist, Anthony de la Tour, opened, in 1589, an academy of painting under the name of the Incamminati (or, as we might paraphrase it, the Right Road), provided with numerous casts, books, and bassi-relievi, which Lodovico had collected in his travels. From the affability and kindness of the Caracci, and their zeal for the scientific education of the students, their academy rose rapidly in popular estimation, and soon every other school of art in Bologna was deserted and closed. They continued together till, at the invitation of Cardinal Farnese, Annibale and Agostino went to Rome in 1600 to paint the gallery of the cardinal's palace. The superior praises awarded to Agostino inflamed the jealousy of Annibale, already kindled by the brilliant reception given by the pupils of the Incamminati to Agostino's still highly celebrated picture of the Communion of St Jerome, and the latter was dismissed to Parma to paint the great saloon of the Casino. Here he died in 1601, when on the eve of finishing his renowned painting of Celestial, Terrestrial, and Vernal Love. Annibale continued to work alone at the Farnese gallery till the designs were completed; but, disappointed at the miserable remuneration offered by the cardinal, he retired to Naples, where an unsuccessful contest for a great work in the church of the Jesuits threw him into a fever, of which he died in 1609. Lodovico always remained at his academy in Bologna (excepting for a short visit to his

cousin at Rome), though invited to execute paintings in all parts of the country. He died in 1619, and was interred in the church of St Mary Magdalene. The works of Lodovico are numerous in the chapels of Bologna. The most famous are—The Madonna standing on the moon, with St Francis and St Jerome beside her, attended by a retinue of angels; John the Baptist, St Jerome, St Benedict, and St Cecilia; and the Limbo of the Fathers. He was by far the most amiable of the three cousins, rising superior to all feelings of jealousy towards his rivals, and though he received large sums for his productions, yet, from his almost unparalleled liberality to the students of the academy, he died poor. With skill in painting Agostino combined the greatest proficiency in engraving (which he had studied under Cornelius de Cort) and high accomplishments as a scholar. He died not untroubled by remorse for the indecencies which, in accordance with the corruption of the time, he had introduced into some of his engravings. The works of Annibale are more diversified in style than those of the others, and comprise specimens of painting after the manner of Correggio, Titian, Paolo Veronese, Raphael, and Michelangelo. The most distinguished are the Dead Christ in the lap of the Madonna; the Infant and St John; St Catherine; St Roch distributing alms (now in the Dresden Gallery); and the Saviour waivered over by the Maries, at present in possession of the earl of Carlisle. He frequently gave great importance to the landscape in his compositions. The reputation of Annibale is tarnished by his jealousy and vindictiveness towards his brother, and the licentiousness of his disposition, which contributed to bring him to a comparatively early grave.

The three Caracci were the founders of the so-called Eclectic School of painting,—the principle of which was to study in the works of the great masters the several excellencies for which they had been respectively pre-eminent, and to combine these in the productions of the school itself; for instance, there was to be the design of Raphael, the power of Michelangelo, the colour of Titian, and so on. The dullest or mildest connoisseur will at once perceive that a picture uniting these various kinds of greatness would be a glorious and indeed an unparagoned work of art; but it does not follow that the attempt to transfer the several qualities, by study and practice, from the works of various men to those of one man, is fruitful of good. It is, in fact, far the reverse; and at the present day perhaps few axioms in art have won a wider acceptance than that which pronounces eclecticism to be at once a result and a symptom of decadence. Eclecticism indicates that the creative impulse, the vital energy and fertility, of art have departed; that the practitioners of the day can no longer do what their forerunners did—produce admirable works, because in themselves spontaneously capable of doing so. They have on the contrary to investigate what has been achieved, and labour not for a new achievement resembling those which preceded in so far as all are the product of some personal gift, special and unforestalled, but rather for an achievement recombining and re-applying old successes, and qualifying, or indeed neutralizing, the strength of one quality by that of another. This is, in effect, an attempt to produce works of art upon the principles which govern the criticism of those works,—an attempt predestined to sterility, for no two things are more antagonistic than the producing power and the criticizing power. They may, no doubt, be united in the same person, but cannot work out their results the one through the medium of the other.

CARACTACUS, a chief of the Silures in ancient Britain. See BRITANNIA, vol. iv. p. 353.

CARAMAN, or KARAMAN, a town of Asiatic Turkey, in the vilayet of Konia in Asia Minor, 61 miles south-east of the city of Konia (*Iconium*) on the border of an extensive

plain at the foot of Mount Taurus, in 37° 13' N. lat. and 33° 28' E. long. It now contains about 1000 houses, three or four mosques, and an American church, and among other traces of its former importance are the ruins of a castle, the outer wall of which is of compass enough to contain about 100 houses. It trades with Smyrna and the other towns of Asia Minor, and manufactures coarse cloth from the wool of the neighbouring highlands. By the Greeks it is still called by its ancient name of Laranda, which was changed by the Turks for its present designation in honour of Karaman, the founder of the Karamanian kingdom. Little is known of its ancient history except that it was destroyed by Perdiccas about 322 B.C., and afterwards became a seat of Isaurian pirates. It was taken possession of by Frederick Barbarossa in 1190; in 1466 it was captured by Mahomet II., and in 1486 by Bajazet II.

CARAMANIA, or KARAMANIA, is a name that has been frequently given by modern geographers to the south coast of Asia Minor, including the whole of the districts between Mount Taurus and the Mediterranean, known in ancient times as Lycia, Pamphylia, and Cilicia. It is in this sense that the term is used by Captain Beaufort, who, by the publication of his work (*Karamania: a Description of the South-East Coast of Asia Minor*, 8vo, 1816), which contained the first detailed account of the countries in question, did much to perpetuate the usage. But he himself admits that there is no authority for the application of the term in this sense. The only foundation for it was the existence, after the break up of the monarchy of the Seljukian Turks, of an independent Turkish kingdom, comprising a portion of the interior, north of the Taurus, to which for a short time the adjacent maritime provinces were annexed. This state bore the name of Karaman-ili, derived from that of its founder, and after it was finally subdued by the Ottoman Turks in 1486 it still continued to exist as a pashalic or government, the seat of which was fixed at Karaman, a considerable town on the north side of the Taurus, occupying the site of the ancient Laranda. But the pashalie thus named was situated wholly in the interior, north of the great chain of Mount Taurus, and comprised no part of the maritime districts, to which the name of Karamania was applied by European geographers. This erroneous use of the term may be considered as now obsolete, and the name of Karaman is no longer found among the territorial divisions of Turkey. The regions comprised under this appellation as employed by Captain Beaufort and Colonel Leake will be described under the headings LYCIA, PAMPHYLIA, and CILICIA.

CARAVACA, a town of Spain, in the province of Murcia, near a stream of the same name, which is tributary to the Segura, in 38° 6' N. lat., 2° 2' W. long. It is commanded by the ancient castle of Santa Cruz, and has an old parish church, with several convents, hospitals, and schools. The hills in the neighbourhood yield various kinds of marble, and in a mountain on the west is the stalactite cavern of Barquilla. The miraculous cross of Caravaca is famous for its healing powers, and a great festival is held in its honour on the 3d of May. Population, 6840.

CARAVAGGIO, MICHELANGELO AMERIGHI (or MERIGI) DA (1569–1609), a celebrated painter, born in the village of Caravaggio, in Lombardy, from which he received his name. He was originally a mason's labourer, but his powerful genius directed him to painting, at which he worked with immitigable energy and amazing force. He despised every sort of idealism whether noble or emasculate, became the head of the Naturalisti (unmodified imitators of ordinary nature) in painting, and adopted a style of potent contrasts of light and shadow, laid on with a sort of fury, emblematic of that fierce temper which led the artist to commit a

homicide in a gambling quarrel at Rome. To avoid the consequences of his crime he fled to Naples and to Malta, where he was imprisoned for another attempt to avenge a quarrel. Escaping to Sicily, he was attacked by a party sent in pursuit of him, and severely wounded. Being pardoned, he set out for Rome; but having been arrested by mistake before his arrival, and afterwards released, and left to shift for himself in excessive heat, and still suffering from wounds and hardships, he expired of fever on the beach at Ponterecole in 1609. His best pictures are the Entombment of Christ, now in the Vatican; St Sebastian, in the Roman Capitol; a magnificent whole-length portrait of a grand-master of the Knights of Malta, Alof de Vignacourt, and his page, in the Louvre; and the Supper at Emmaus, in the Borghese Palace.

CARAVAGGIO, POLIDORO CALDARA DA (1495–1543), a celebrated painter of frieze and other decorations in the Vatican, whose merits were such that, while a mere mortar-carrier to the artists engaged in that work, he attracted the admiration of Raphael, then employed on his great pictures in the Loggia of the palace. Polidoro's works, as well as those of his master, Maturino of Florence, have mostly perished, but are well known by the fine etchings of P. S. Bartoli, Alberti, &c. On the sack of Rome by the army of the Constable Bourbon in 1527, Polidoro fled to Naples. Thence he went to Messina, where he was much employed, and gained a considerable fortune, with which he was about to return to the mainland of Italy when he was robbed and murdered by an assistant, Tonno Calabrese, in 1543. Two of his principal paintings are a Crucifixion, painted in Messina, and Christ bearing the Cross, in the Naples gallery.

CARAVAN, or to write it more correctly, KARAWAN, is a Persian word, adopted into the later Arabic vocabulary, but rarely employed in speech and never in writing within the limits of Arabia proper, where other designations of strictly Arabic origin such as "Rikb" (assembled riders) or "Kafilah" (wayfaring band) are in ordinary use.

In common acceptance, then, throughout Syria, Mesopotamia, and Asiatic Turkey generally, besides Persia, a caravan denotes a body of peaceable citizens, merchants, salesmen, and the like, travelling together on business for some considerable distance. The principal reasons which in the Asiatic region induce people of this class thus to unite for their journeys, and that in as large numbers as practicable, are, firstly, the greater security thus insured, or at least expected, against robbers, and in particular against marauding parties of Bedouins, Kurds, Tartars, and the like, whose grazing-grounds the proposed route may traverse; and, secondly, mutual assistance in the matter of provisions, water, and so forth. Bad government, or not rarely the absence of any government whatever, necessitates the first precaution; want of inns, baiting-places, and perhaps of habitations altogether, the second. It should also be remembered that no roads, in the European sense of the word, but merely tracks, and those difficult and often interrupted, exist throughout Asiatic Turkey and Persia generally,—a fact that speaks badly for the "Public Works Department" in both empires. These conditions having existed more or less from time immemorial in the major part of Western Asia, and still existing, caravans always have been in that part of the world, and still are the principal means for conveying merchandize from one commercial centre to another.

In these companies camels are most generally employed for the transport of heavy goods, especially where the track, like that between Damascus and Baghdad, for example, lies across level, sandy, and arid districts. The camels are harnessed in strings of fifty and more at a time, a hair-rope connecting the rear of one beast with the

head of another; the leader is gaily decorated with party-coloured trappings, tassels, and bells; an unladen ass precedes the file, for luck, say some, for guidance, say others—a not inappropriate allusion to human affairs in general. Where the route is rocky and steep, as that between Damascus and Aleppo, mules, or even asses, are used for burdens. The wealthier individuals of the party accompany it, where possible, on horseback. Every man carries arms; but these are in truth more for show than for use, and are commonly flung away in the presence of any serious robber-attack; of wild beasts there is little danger, none of formidable size or disposition existing in the Levantine East. Should greater peril than ordinary be anticipated from Bedouins or the like, the protection of a company of soldiers is habitually pre-engaged,—an expensive, and ordinarily a useless adjunct. A leader or director, called "Karawan-Bashi" (headman), or, out of compliment, "Karawan-Seraskier" (general), both terms of Perso-Turkish composition, but most often simply designated as "Reis" (chief), is before starting appointed by common consent. His duties are those of general manager, spokesman, arbitrator, and so forth; his remuneration indefinite. But in the matter of sales or purchases, either on the way or at destination, each member of the caravan manages as best he can for himself.

The number of camels or mules in a single caravan varies from forty or so up to six hundred and more; sometimes, as on the reopening of a long-closed route, it reaches a thousand. The movements of caravans are chiefly regulated by the seasons,—the summer and early autumn, when the heat is at its fiercest and water scarce, being, when possible, avoided, as also, though for opposite reasons, the brief but severe cold of a Levantine winter. Hence the ordinary caravan-seasons are the months of spring, early summer, and later autumn. Friday, in accordance with a recommendation made in the Koran itself, is the favourite day for setting out, the most auspicious hour being that immediately following noonday prayer. The first day's march never does more than just clear the starting-point by a couple of miles, or thereabouts. Subsequently each day's route is divided into two stages,—the first being from 3 or 4 A.M. to about 10 in the forenoon; a halt follows, then travelling is resumed between 2 and 3 P.M. and continued till 6, or even 8 in the evening. Thus the time passed daily on the road averages from ten to twelve hours, and, as the ordinary pace of a laden camel does not exceed 2 miles an hour, that of a mule being $2\frac{1}{2}$, it follows that a distance varying from 23 to 28 miles is gone over every marching day. But prolonged halts of two, three, four, and even more days are often interpolated, as business, fatigue, or fear of danger may suggest.

The hours of halt, start, and movement, the precise lines of route, and the selection or avoidance of particular localities are determined by common consent and the necessity of acting in concert, influences to which the "Reis" himself, apart from his personal recommendations, is indebted for whatever authority he may possess. But if, as sometimes happens, the services of a professional guide, or those of a military officer have been engaged, their will has to be deferred to in such matters. Indeed many a caravan has been plundered, or even totally destroyed, through the treachery of a hired guide. Partnership may unite interests in the East, but paid hire more certainly disunites them,—a hint worth a traveller's remembrance. While the caravan is on its way, the five stated daily prayers are, within certain limits, anticipated, deferred, or even curtailed, so as the better to coincide with the regular and necessary halts,—a practice authorized by the most orthodox Mahometan custom and tradition.

Two caravans, the one of Ismaelites, probably "Must"

arebs," or semi-Syro-Arabs of early times, to whom also Joseph was sold, the other of Midianites, or natives of the Hawran district, are mentioned in Genesis ch. xxxvii.; the route on which they were passing seems to have coincided with that nowadays travelled by Syrian caravans on their way to Egypt. Other allusions to caravans may be found in the Hebrew records, *e.g.*, in the book of Job, in Isaiah, and in the Psalms. Eastern literature is, of course, full of mention of them.

The yearly pilgrim-bands, bound from various quarters of the Mahometan world to their common destination Mecca, are sometimes, but inaccurately, styled by European writers caravans; their proper designation is "Hajj," a collective word for pilgrimages and pilgrims. Some description of them may however not unsuitably find a place here.

The two principal pilgrim-caravans, or "Hajj," start yearly, the one from Damascus, or, to speak more exactly, from Mozareeb, a village station three days' journey to the south of the Syrian capital, the other from Cairo in Egypt. This latter is joined on its route, near Akabah of the Red Sea, by the Moghrebbe, or North African "Hajj," collected from Tripoli, Morocco, and Tunis; the former gathers up bands from Anatolia, Kurdistan, Mesopotamia, and Syria. Besides these a third, but smaller "Hajj" of Persians, chiefly sets out from Sook-esh-Sheyukh, in the neighbourhood of Meshed Ale, on the lower Euphrates; a fourth of Negroes, Nubians, Darfoores, &c., unites at Yembo on the Hejaz coast, whither they have crossed from Koseyr in Upper Egypt; a fifth of Indians and Malays, centres at Jiddah; a sixth and seventh, of southern or eastern Arabs arrive, the former from Yeuén, the latter from Nejd.

The Syrian "Hajj" is headed by the Pasha of Damascus, either in person or by a vicarious official of high rank, and is further accompanied by the "Sorrah Ameer," or "Guardian of the Purse," a Turkish officer from Constantinople, charged with the imperial contribution to the expense of the route, but chiefly with presents, or, to put it more truly, black mail, for the benefit of the independent Arab tribes, through whose lands the wayfarers must pass. The Egyptian company is commanded by an "Ameer," or ruler, appointed by the Cairene Government, and is accompanied by the famous "Mahmal," or sacred pavilion. The other bands above mentioned have each their own "Ameer," besides their "Mekowwams" or agents, whose business it is to see after provisions, water, and the like, and are not seldom encumbered with a numerous retinue of servants and other attendants. Lastly, a considerable force of soldiery, one, two, or more regiments strong, accompanies both the Syrian and the Egyptian "Hajj."

No guides properly so called attend these pilgrim-caravans, the routes followed being invariably the same, and well known. But Bedouin bands generally offer themselves by way of escort, and not seldom designedly lead their clients into the identical dangers from which they bargained to keep them safe. This they are the readier to do that, in addition to the personal luxuries with which many of the pilgrims provide themselves for the journey, a large amount of wealth, both in merchandize and coins, is habitually to be found among the travellers, who, in accordance with Mahometan tradition, consider it not merely lawful but praiseworthy to unite mercantile speculation with religious duty. Nor has any one, the Pasha himself or the Ameer and the military, when present, excepted, any acknowledged authority or general control in the pilgrim-caravans; nor is there any orderly subdivision of management of service. The pilgrims do, indeed, often coalesce in companies among themselves for mutual help, but necessity, circumstance, or caprice governs all details, and thus it happens that numbers, sometimes as many as a third of the entire

"Hajj," yearly perish by their own negligence or by misfortune,—dying, some of thirst, others of fatigue and sickness, others by robbers on the way. In fact the principal routes are in many places lined for miles together with the bones of camels and men.

The numbers which compose these pilgrim-caravans are much exaggerated by popular rumour; yet it is certain that the Syrian and Egyptian sometimes amount to 5000 each, with twenty-five or thirty thousand camels in train. Large supplies of food and water have to be carried, the more so at times that the pilgrim season, following as it does the Mahometan calendar, which is lunar, falls for years together in the very hottest season, though, indeed, the Hejaz portion of the route is always hot enough even in winter. Hence, too, the journey is usually accomplished by night marches, the hours being from 3 to 4 P.M. to 6 or 7 A.M. of the following day. Torches are lighted on the road; the pace is slower than that of an ordinary caravan, and does not exceed two miles an hour.

For the ceremonial and religious peculiarities of these pilgrim-caravans, or "Hajj," see Burckhardt's *Travels in Arabia*, and Laue's *Modern Egyptians*, cc. xxiv. and xxv. In other respects the "Hajj" does not differ materially from an ordinary caravan, and it is from this point of view that it finds place in the present notice. (W. G. P.)

CARAVANSERAI, a public building, for the shelter of caravans and of wayfarers generally. It is commonly constructed in the neighbourhood, but not within the walls, of some town or village, and bears the form of a quadrangle, with a dead wall outside, only pierced below by a few narrow air-holes, but with small windows higher up. Within, a cloister-like arcade, surrounded by cellular store-rooms, forms the ground-floor; and a somewhat lighter arcade, giving access to little dwelling-rooms, runs round it above. Broad, open flights of stone steps connect the stories. The central court is open to the sky, and generally has in its centre a well with a fountain-basin beside it; but sometimes the well is outside the building. A spacious portal, high and wide enough to admit the passage of a loaded camel, forms the sole entrance, which is furnished with heavy iron-plated folding doors, and is further guarded within by massive iron chains, drawn across at night. Each side of the entry is also provided with stone seats, and the entry paved with flagstones. The court itself is most often paved also, and large enough to admit of three or four hundred crouching camels or tethered mules; the bales of merchandize are piled away under the lower arcade, or stored up in the cellars behind it; the upstairs apartments are for human lodging; but cooking is usually carried on in one or more corners of the quadrangle below. Should the caravanserai be a small one, the merchants and their goods alone find place within, the beasts of burden being left outside. A porter, appointed by the municipal authority of the place, is always present, lodged just within the gate, and sometimes one or more assistants. These form a guard of the building and of the goods and persons in it, and have the right to maintain order and, within certain limits, decorum; but they have no further control over the temporary occupants of the place, which is always kept open from prayer-time at early dawn till late in the evening for all arrivals. A small gratuity is expected, by, and is generally given by the guests to, the porter; but he has no legal claim for payment from travellers, his maintenance being provided for out of the funds of the institution. Neither food nor provender is supplied in a caravanserai, water and shelter only; the rest the caravan has to find for itself. Many caravanserais in Syria, Mesopotamia, and Anatolia are possessed of considerable architectural merit; their style of construction is in general that known as Saracenic; their walls are massive,

and of hewn stone; their proportions apt and grand. The portals especially are often decorated with intricate carving; so also is the prayer-niche within, that indicates the direction of the Meccan Kibleh. These buildings, with their belongings, are works of charity, and are supported, repaired, and so forth, out of funds derived from pious legacies, most often of land or rentals. Sometimes a municipality takes on itself to construct and maintain a caravanserai; but in any case the institution is registered as tax-free, and its revenues are inalienable. When, as sometimes happens, those revenues have been dissipated by speculation, neglect, or change of times, the caravanserai passes through downward stages of dilapidation to total ruin (of which only too many examples may be seen by the Eastern traveller), unless some new charity intervene to repair and renew it. In the general decline of wealth, public spirit, and prosperity actually prevailing throughout the Mahometan Levant, such better fortune is, however, rare. "Khans," or places more analogous to our own town-inns and hotels, where not lodging only, but often food and other necessities or comforts may be had for payment, are sometimes by inaccurate writers confounded with caravanserais, though having really nothing in common with them, except that they are also for the use of travellers. These "Khans" are generally to be found within the town or village precincts, and are of much smaller dimensions than caravanserais. The "Khan" called that of Asaad Pasha at Damascus is a model of constructive skill and architectural beauty. (W. G. P.)

CARAVELLAS, a seaport town of Brazil, in the province of Espiritu Santo, on a river, and not far from a bay, to which it gives its name, in 17° 49' S. lat. and 39° 26' W. long. It is the principal port of the neighbouring country, and serves as the headquarters of the whale fishery of the Abrolhos Islands which lie off the coast. Population, about 5000.

CARAWAY, the fruit, or so-called seed, of *Carum carui*, an umbelliferous plant growing throughout the northern and central parts of Europe and Asia. The plant has finely-cut leaves and compound umbels, and fruits laterally compressed and ovate,—the mericarps being subcylindrical, slightly arched, and marked with five distinct pale ridges. Caraways evolve a pleasant aromatic odour when bruised, and they have an agreeable spicy taste. They yield from 3 to 6 per cent. of a volatile oil, which is a compound of carvol (a mobile liquid isomeric with the menthol of spearmint) and carvene. The plant is cultivated in the northern parts of Norway, in Finland, Russia, Germany, Holland, and in Morocco, as well as in the south of England, the produce of more northerly latitudes being richer in essential oil than that grown in southern regions. The essential oil is largely obtained by distillation for use in medicine as an aromatic stimulant and carminative, and as a flavouring material in cookery and in liqueurs for drinking. Caraways are, however, more extensively consumed entire in certain kinds of cheese, cakes, and bread, and they form the basis of a popular article of confectionery known as caraway comfits.

CARBOLIC ACID, or **PHENOL** (C_6H_6O), an acid substance forming one of the numerous constituents of coal-tar, was first described by Runge in 1834. Its constitution was investigated by Laurent in 1841, who, regarding it as a hydrated oxide of the compound radical phenyl, termed it the hydrate of phenyl. Among other names it has received are phenic acid, phenyl alcohol, and creosote; but though the latter is popularly applied to an impure mixture of carbolic acid and the allied cresylic acid, it properly belongs to an altogether distinct substance. In addition to being an abundant constituent of coal-tar, carbolic acid is formed by the action of heat upon salicylic

acid; it can be obtained by the dry distillation of gum-benzoin and other resinous substances; traces of it are found in the urine of the horse, the ox, and man; and to it castoreum owes its peculiar odour.

Commercial carbolic acid is prepared solely from coal-tar by a method of which the following is an outline. When coal-tar is distilled the most volatile products—benzol, toluol, cumol, &c., first come away, after which when the temperature rises from 150° C. to 200° C. crude carbolic acid distils over. This distillate is mixed with a strong solution of caustic potash, and the resulting carbolate of potash is in its turn treated with sulphuric acid, which decomposes the carbolate, liberating carbolic acid, which rises to the surface as an oily layer, and is removed by a syphon. The product is purified by washing and repeated rectification, and finally cooled down to 10° C., when it forms whitish acicular crystals, from which the unsolidified acid is drained away. Crystallized carbolic acid of commerce retains a strong naphthalic odour, from which it may be freed for medicinal or other purposes by a method recommended by Professor Church. Into 1 lb of the crystallized acid he pours 20 lb of cold distilled water, care being taken that the whole of the acid shall not be dissolved. The mixture is repeatedly shaken till from 2 to 3 ounces of the acid only remains undissolved, in which residue the whole of the impurities are retained. From this, the aqueous solution is syphoned off, and if necessary, filtered, and then pure powdered common salt is added to it till the salt will no longer dissolve. After standing some time the whole of the carbolic acid rises to the surface, and floats as a yellow oily layer, which as it contains 5 per cent. of water will not crystallize. It may be crystallized by distilling from a little lime, and the product collected up to 185° C. will possess only a faint pleasant aromatic odour. Pure carbolic acid crystallizes in long colourless needles; it melts at 35° C., and boils about 187° C. It is soluble in all proportions in alcohol, ether, and strong acetic acid, but dissolves only sparingly in water. It does not redden litmus paper; it exerts a powerful corrosive action on the skin; its aqueous solution coagulates albumen; and it unites with animal substances, preserving them from decomposition, and removing the offensive odour from putrefying matter.

The extensive manufacture and employment of carbolic acid are, in a large degree, owing to the exertions of the late Professor Crace Calvert, who was the first to manufacture it in the crystalline form. The development of the aniline colour industry also communicated an impetus to the manufacture of carbolic acid, as the one is, in a sense, a secondary product of the other. A great many useful applications have opened up for the employment of the acid in addition to its extensive medicinal and antiseptic uses (see **ANTISEPTICS**). For domestic, sanitary, and medicinal use, carbolic acid is prepared in various states of purity and strength. Toilet and medicated soaps, tooth powder, disinfecting powder, &c., are all prepared containing definite proportions of the acid. A large quantity of crude carbolic acid is employed under the name of creosote for impregnating wood for railway sleepers and piles, and for engineering purposes generally,—a method of preserving wood discovered and patented by Mr John Bethell.

Carbolic acid is, however, most largely consumed in the preparation of several dyeing materials, which are second only in importance to the colours derived from aniline. Picric or carbazotic acid is a brilliant yellow dye-stuff, much used for wool and silk dyeing, prepared by very cautiously adding in small quantities nitric acid to crystallized carbolic acid, or to a mixture of carbolic acid with sulphuric acid. From picric acid in its turn two derivatives are obtained.

isopurpuric acid and picramic acid, but these have only a limited application in dyeing. Coralline, a dye in extensive use, yielding a variety of fine red shades, is obtained by heating together two parts of oxalic acid, three of carbolic acid, and four of sulphuric acid to a temperature of from 140°C . to 150°C . Peonine, or red coralline, is a product of coralline obtained by acting on it at a temperature of about 130°C . with a concentrated solution of ammonia. It yields on wool and silk a very rich durable Turkey-red-like shade. Aurine, or yellow coralline, is made by mixing together oxalic acid, carbolic acid and sulphuric acid, the same as for ordinary coralline, but the mixture is submitted to a less elevated temperature. It dyes fine yellow and orange shades on animal fibres. Pheniceune, or rothine, is a dye producing shades varying from a deep garnet red to a chamois colour, made by adding to carbolic acid a mixture of nitric and sulphuric acids. Fol's yellow is manufactured by heating to 100°C . a mixture of five parts of carbolic acid and three of powdered arsenic acid. Besides these various other dyes having carbolic acid for their basis have been introduced and some of them are commercially established.

CARBON (*symbol, C; atomic weight, 12*) is one of the most important of the chemical elements. It occurs pure in the diamond, and nearly pure as graphite or plumbago; it is a constituent of all animal and vegetable tissues and of coal; and it also enters into the composition of many minerals, such as chalk and dolomite.

Carbon is a solid substance, destitute of taste and odour; but it occurs in several modifications which exhibit very diverse physical properties. Thus, it is met with in the form of the diamond in transparent crystals belonging to the regular or cubical system, which conduct electricity but slowly; and in the form of graphite in opaque crystals belonging to the hexagonal system, which conduct electricity nearly as well as the metals. The diamond is the hardest substance known, and has a relatively high specific gravity (3.53 to 3.55), but graphite is comparatively soft, producing a black shining streak when rubbed upon paper, and has a much lower specific gravity (2.15 to 2.35). In addition to these two crystalline modifications of carbon there are a number of varieties of non-crystalline or amorphous carbon, which, however, exhibit the greatest differences in physical properties.

By heating to the high temperature afforded by a powerful galvanic battery, both the diamond and amorphous carbon are converted into graphite. In the electric arc carbon appears to be converted into vapour; but the temperature which is required to volatilize it is extremely high; in fact, it has been calculated¹ that the boiling-point of carbon is not less than about 7000° on the centigrade scale.

Although the various allotropic modifications of carbon cannot always be satisfactorily distinguished by their physical properties, they may readily be distinguished, as Berthelot has shown, by their behaviour on treatment with certain oxidizing agents. The diamond is not affected thereby even after prolonged and reiterated treatment. The different varieties of amorphous carbon, however, are more or less readily entirely converted into humus-like substances, or "humic acids," soluble in water, whereas the different varieties of graphite furnish "graphitic oxides," which are insoluble in water, and especially characterized by the property of undergoing decomposition with deflagration when heated. The method of treatment adopted by Berthelot is as follows. The carbon in the form of an impalpable powder is mixed with the aid of a card with five times its weight of pulverized potassic chlorate, and

this mixture is then formed little by little into a paste with fuming nitric acid. In performing these operations great care is necessary in order to avoid explosions, and at most five grams of carbon should be taken. The mixture, contained in a small open flask, is allowed to stand several hours, and is then heated for three or four days without interruption to a temperature not higher than 50° or 60°C .; the mass is then diluted with water and washed by decantation with tepid water. It is necessary as a rule to repeat this series of operations several times in order entirely to dissolve the amorphous carbons, or to convert the graphites into graphitic oxides.

Berthelot has examined a very large number of varieties of carbon in this manner with the following results. The carbon of wood charcoal, animal charcoal, coke, the so-called metallic carbon obtained by decomposing hydrocarbons by passing their vapours through a red-hot tube, gas-retort carbon, and various specimens of anthracite from different sources, all dissolved entirely with more or less readiness when treated in the above manner; lamp black, however, furnished a small amount of graphitic oxide. The amorphous carbon of the meteorite of Cranbourne (Australia) furnished a graphitic oxide identical with that obtained by similarly treating graphite from cast-iron, but the carbon of the Orgueil meteorite was entirely soluble. The carbon of the Greenland meteoric rock discovered by Nordenskiöld also dissolved entirely with the exception of a very insignificant residue.

Berthelot also examined the action of various agents on carbon, and finds that heat alone is without influence; that is to say, the graphites are not changed into amorphous carbon, or the amorphous carbons into graphite, when heated to whiteness in an atmosphere of hydrogen or of chlorine. When, however, a pencil of gas-retort carbon is inflamed in an atmosphere of oxygen, and then as soon as the point is fully incandescent plunged into water, the part which has been heated contains a small quantity of graphite. On examining the pencils of carbon employed in producing the electric light it was found that the spongy mass of carbon collected on the negative pole contained a large proportion of graphite, but that only traces were present in the pencil employed as positive pole, which appears to indicate that it is necessary for the carbon to undergo volatilization in order that it may be converted into graphite. The graphite thus produced is not identical with that contained in cast-iron, nor with natural plumbago: the same variety of graphite is produced, however, when the diamond is heated in the electric arc. The carbon separated from the various hydrocarbons by heat alone consists entirely of amorphous carbon, but that obtained on decomposing marsh gas by the electric spark contains a small quantity of graphite, and the carbon resulting from the decomposition of perchloride of carbon and bisulphide of carbon at a red heat contains a considerable proportion of graphite; that resulting from the decomposition of cyanogen by the electric spark contains only traces of graphite.

The specific heats of the several modifications of carbon also differ considerably; that is to say, the amounts of heat required to raise equal weights through the same number of degrees of temperature are different. The diamond has the lowest, and amorphous carbon the highest specific heat; or to raise the temperature of a given weight of the diamond from the temperature a to the temperature b will require less heat than to raise the temperature of the same weight of amorphous carbon from the temperature a to b .

Graphite.—Graphite is found native near Travancore in Ceylon, and near Moreton Bay in Australia, in several parts of the United States, in South Siberia, and in Germany, principally at Griessbach near Passau, always in rocks

¹ D. war Phil. Mag. (4.), xlii. p. 461. 1872.

belonging to the earliest formations. It occurs in two distinct modifications, one of which, like the Borrowdale graphite, is fine-grained and amorphous; the other, like the Ceylon variety, is composed of small flat plates. Native graphite contains from 95 to nearly 100 per cent. of carbon, the impurity being usually small quantities of silicates. Graphite, also called plumbago or black lead, is used for making so-called lead pencils, for polishing iron work, for lubricating machinery, for making crucibles, and in the electrotype process for coating the surfaces of wood, plaster-of-paris, gutta-percha, and other non-conducting materials, so as to render them conductive.

The behaviour of graphite on treatment with a mixture of potassic chlorate and nitric acid has been carefully studied by Brodie; but our knowledge of its oxidation products is still very incomplete. He has shown that it is converted into a body to which he attributes the composition indicated by the formula $C_{11}H_4O_5$; *graphitic acid*, as this compound is termed, forms yellow silky plates, insoluble in water and acids. It does not form salts, and Berthelot therefore prefers to call it *graphitic oxide*. When this substance is heated it decomposes almost with explosive violence, leaving a residue which still contains hydrogen and oxygen, but which is not distinguishable from finely divided graphite. When the graphite which crystallizes from cast-iron and that obtained by heating amorphous carbon in the electric arc are similarly treated, graphitic oxides are produced which differ from each other, and from the oxide formed from native graphite; it is therefore supposed that these graphites are distinct substances (Berthelot, *Ann. Ch. Phys.* [4] xix. 399).

Amorphous Carbon.—Pure amorphous carbon is only obtained with great difficulty. That produced by heating pure organic substances, such as sugar and starch, still contains traces of hydrogen and oxygen, from which it can only be freed by long-continued ignition at a white-heat in an atmosphere of chlorine. The purest amorphous carbon ordinarily met with is *lamp black*, which is prepared by the imperfect combustion of highly carbonized bodies, such as resin. An amorphous carbon of considerable purity, known as *gas-retort carbon*, is obtained in the manufacture of coal-gas. The parts of the retort which are exposed to the highest temperature partially decompose the gas as it escapes, and by degrees a layer of very dense carbon is deposited in the upper parts of the retorts. It is a good conductor of heat and electricity, and burns with difficulty, and is therefore employed in producing the electric light, and to form the negative element in Bunsen's voltaic battery. *Wood charcoal* and *coke* are very impure forms of amorphous carbon, containing in addition to small quantities of hydrogen and oxygen a considerable proportion of mineral matters, which remain as ashes when the charcoal or coke is burnt. *Animal charcoal* is a still more impure form of amorphous carbon.

Oxides of Carbon.—When carbon is burnt in oxygen *carbonic dioxide* or *carbonic anhydride*, or, as it is commonly termed, *carbonic acid*, CO_2 , is formed; if the supply of oxygen is deficient the lower oxide, *carbonic oxide*, CO , is also produced, and the latter may be obtained in a pure state by passing the dioxide over red-hot carbon. Both are colourless, odourless gases. The union of carbon with oxygen gives rise to the evolution of a very large amount of heat, but much less heat is produced by the union of the first half of the oxygen than by the union of the second half. Thus the combination of 12 grams of carbon with 16 grams of oxygen to form 28 grams of carbonic oxide gives rise to the evolution of about 25,000 units of heat, but no less than 69,000 units are produced by the addition of a second 16 grams of oxygen to form carbonic dioxide. It is supposed that in the first instance very much less heat

is evolved because energy, which otherwise would appear in the form of heat, is expended in converting the solid carbon into the state in which it exists in gaseous carbonic oxide and dioxide, since it is observed that in those cases in which two oxides are formed, both of which are solid, sensibly equal quantities of heat are evolved in the fixation of each successive 16 grams of oxygen.

In the conversion, however, of the different varieties of carbon into carbonic dioxide, CO_2 , by combustion in oxygen different amounts of heat are produced. The following table represents the number of units of heat (the unit of heat being the amount required to raise the temperature of 1 gram of water from 0° to 1° C.) evolved in the conversion of 12 grams of each of the varieties of carbon into 44 grams of carbonic dioxide:—

	Units.
Diamond	33,240
Iron graphite	93,144
Natural graphite	93,564
Gas-retort carbon	96,564
Wood charcoal	96,960

Carbonic oxide burns in the air or oxygen with a blue flame, forming carbonic dioxide. It is an extremely poisonous gas, being capable of displacing the oxygen in blood, owing to the formation of a compound with the hæmoglobin with which the oxygen is ordinarily combined. It is very sparingly soluble in water, which dissolves only about $\frac{1}{16}$ th of its bulk at 15° C. When a mixture of equal volumes of carbonic oxide and chlorine gas is exposed to sunlight, the two gases combine, forming chloro-carbonic oxide or phosgene gas, $COCl_2$.

Carbonic dioxide will not burn, neither does it support combustion. Under the pressure of 36 atmospheres at 0° C. it is converted into a colourless mobile liquid. When the liquid is suddenly relieved from the pressure under which alone it can exist, part of it at once passes back into the state of gas, and heat is abstracted so rapidly that the remaining portion of the liquid solidifies. By allowing a jet of the liquid dioxide to pass into a cylindrical metal box, having within it an inclined metal tongue against which the jet of liquid impinges, a considerable quantity of the solid may be collected in the form of a white flocculent mass like snow. Like all flocculent substances, it conducts heat but slowly, and may be preserved for a considerable time. By mixing it with ether its heat-conducting power is greatly increased; it therefore evaporates much more quickly, and a much lower temperature is obtained than with the solid alone, and by placing the mixture under the receiver of an air-pump and exhausting, a still greater degree of cold is produced. According to Faraday, an alcohol thermometer plunged into a bath of the solid carbonic dioxide and ether in air indicates a temperature of -76° C., and in the same bath under a receiver exhausted to within 12 inches of the atmospheric pressure it fell to -110° C.; at the latter temperature alcohol assumes the consistence of a thick oil.

Recent experiments of Sir B. Brodie (*Royal Society Proceedings*, xxi. p. 483, 1873) show that carbonic oxide and dioxide are not the only oxides of carbon which are capable of existing. When a current of pure and dry carbonic oxide is circulated through a Siemens's induction-tube, and there submitted to the action of electricity, a decomposition of the gas occurs. Carbonic dioxide is formed, and simultaneously with its formation a solid deposit may be observed in the induction-tube; this deposit appears as a transparent film of a red-brown colour. It is entirely soluble in water, which is strongly coloured by it, and the solution has an intensely acid reaction. In the dry condition, before it has been in contact with water, it is an oxide of carbon. Samples, however, made in different experiments do not present precisely the same composition;

but nevertheless they appear to belong to a certain limited number of forms, which repeatedly occur and may invariably be referred to the same general order or system. This system is, or appears to be, what may be termed an homologous series of "oxycarbons," of which the unit of carbon with the weight 12 may be regarded as the first term, and of which the adjacent terms differ by an increment of carbonic oxide, CO , weighing 28, precisely as homologous series of hydrocarbons differ by the increment CH_2 . Two at least of these substances have been identified by analysis, namely, the adjacent terms C_2O_3 and C_3O_4 .

Carbonic Acid.—Carbonic dioxide dissolves in about its own volume of water at ordinary temperatures, forming *carbonic acid*, H_2CO_3 ; the solution has a sharp and slightly acid taste, and turns the blue colour of litmus to wine-red. The volume of carbonic dioxide dissolved by water diminishes as the temperature rises, and at the boiling heat the whole is expelled from solution; the volume dissolved by water at a given temperature is nearly the same, however, under all pressures, so that the weight of gas absorbed increases in nearly the same proportion as the pressure. On removing the pressure the gas is given off with effervescence. Ordinary soda-water consists merely of water impregnated with carbonic dioxide by mechanical pressure. When lime water is added to a solution of carbonic acid, or carbonic dioxide is passed into lime water, a white precipitate of calcic carbonate or carbonate of lime, the chief constituent of ordinary chalk, is produced:—

Calcic hydrate. Carbonic acid. Calcic carbonate. Water.

On continuing to pass the gas the precipitate becomes dissolved owing to the formation of an acid carbonate or bicarbonate, which is fairly soluble in water, the carbonate being almost insoluble:—

Calcic carbonate. Carbonic acid. Calcic bicarbonate.

If the solution of the bicarbonate be heated, carbonic dioxide is given off and the calcic carbonate is precipitated, the bicarbonate being decomposed. The lime salt may also be removed from the solution, with the exception of the small amount of calcic carbonate which the water is capable of dissolving, by carefully adding lime water or a solution of ordinary washing soda as long as a precipitate is produced. The action of lime water in this case is to convert the soluble bicarbonate into the insoluble carbonate; thus:—

Calcic bicarbonate. Calcic hydrate. Calcic carbonate.

These facts serve to explain the "hardness," as it is termed, of many natural waters, and the methods employed to render such waters soft. A water which, like rain water, readily produces a lather with soap is said to be a soft water, whereas one which does not readily yield a lather, but forms a large amount of curd, is said to be a hard water. The hardness of most natural spring waters is chiefly due to dissolved calcic bicarbonate, which is formed by the action of the carbonic acid dissolved in rain upon the calcareous materials with which the water comes in contact during its passage through the earth. Ordinary soap consists of the sodic salts of certain fatty acids, and is soluble in water; but the lime salts of these acids are insoluble, so that when the soap is used with the hard water a double decomposition takes place, the calcic bicarbonate being converted into sodic bicarbonate and the soda-soap into a lime soap or curd. Such waters may be rendered soft, that is to say, the calcic bicarbonate may be removed in a variety of ways, viz., by heating the water, which causes the decomposition of the bicarbonate and the precipi-

tation of the carbonate, and it is in this way that the fur is produced in our kettles and boilers; by adding washing soda or sodic carbonate, a common practice in all households where hard water is used; and lastly, by adding lime water.

(H. E. A.)

CARBONARI, THE (from the Italian *carbonari*, charcoal-maker), were certain secret societies of a liberal and even revolutionary tendency that took an active part in some events of Italian and French history during the first three decades of this century. Secret societies, calling themselves by this or a similar name, had indeed previously existed in various parts of Europe; but it was in Italy, towards the close of the Napoleonic wars, that these first began to assume an historic importance. In 1808 many republicans, discontented alike with the Bourbon and the Bonapartist government in Naples, had retired to the mountain recesses of the Abruzzi and Calabria. At first engaged only in an isolated resistance to the authorities, they began to organize themselves. They took the name of Carbonari, a name suggested by the trade of charcoal-burning extensively pursued in these regions, in which many of them were engaged. From this trade, too, but especially from the Christian religion, and above all from the crucifixion of Christ, they adopted a system of mystic rites and a symbolic phraseology, by which they concealed from the uninitiated, but all the more vividly expressed to the initiated, the real political aims of the society, while its apparently religious character served to attract many whom its revolutionary secrecy might have repelled. A lodge of Carbonari was *laracca* (a hut); an ordinary meeting, *rendita* (a sale); a meeting of importance, *alta rendita*;—these terms being borrowed from the trade of charcoal-burning. But for words to express the inner purpose of the society they borrowed from religion. Christ, as the highest victim of tyranny, was the lamb that had been put to death by the wolf; they were sworn to avenge his death; and so the destruction of the wolf to avenge the slaughter of the lamb became the symbolic watchword of the society. There were four grades in the society; and the ceremonies of initiation were characterized by many mystic rites, through which the real meaning began only gradually to appear. Many efforts were made to bring about a complete organization of the Carbonari in Italy, by the institution of a central power which should control the separate societies of the various provinces, but they failed. Politicians soon discovered how easily capital could be made of such societies, and negotiations were entered into by the Bourbons to unite the Carbonari in an effort to overthrow the French Government in Naples. Accordingly, for two years they carried on a desultory warfare with King Murat, who at last, taking the matter thoroughly in hand, drove them into the mountains, from which they had emerged, and suppressed them for a time. Capobianco, their leader, was treacherously arrested and put to death. Ere long, the Carbonari reappeared and helped towards the final overthrow of the French power in Naples. But Ferdinand, who had courted them during his misfortunes, proved false to them on his return to power, though they were moderate enough in their political aims, being ready to content themselves with the establishment in Naples of the constitution that had been enjoyed in Sicily under English supremacy. Henceforward they began to conspire against the Bourbon Government, and indeed soon spread over the whole of Italy, being more and more regarded as the champions of the liberal and national cause. They were the principal authors of the Neapolitan revolution of 1820, of the disturbances in the Papal States of the same year, and of the Piedmontese revolution of 1821. Previously recruited chiefly from the lower classes, the Carbonari now counted in their ranks almost all the intelligent and patriotic population of Italy,

especially the middle classes, the officers of the army, the students at the universities, the artists, and even the priests,—to the number, it is said, of nearly 700,000. Unable, however, to resist the military power of Austria, backed by a European congress, the revolution and the Carbonari along with it were crushed, and many, such as Silvio Pellico, implicated or supposed to be implicated in their conspiracies, perished or languished in Austrian dungeons. They never quite revived in Italy; though active again in 1830 and 1831, they were forthwith superseded by the more energetic and more extreme “young Italy” of Mazzini.

It was about 1820 that Carbonarism began to take root in France. There the organization was more perfect, as in addition to what had been attained in Italy, there was a supreme board, presided over by the veteran Lafayette, and a complete hierarchy of societies, by which the will of the chief was communicated, from higher to lower, to the smallest lodges in the extremities of France; these were *ventes particulières, ventes centrales, hautes ventes, ventes suprêmes*. It made great progress in France, especially among the students and sub-officers of the army. The example of Spain and Italy having incited the French Carbonari to immediate action, attempts to raise an insurrection were made in 1821 at Belfort, Thourars, La Rochelle, and other towns. They were all immediately suppressed, but not without revealing to what extent the Carbonari had spread over France. It was at the trial of Boriès, one of those concerned in the rising at La Rochelle, that the nature and organization of the Carbonari in France became publicly known, and attention was drawn to the mutual fidelity prevalent among them, as none but those immediately concerned in the insurrection could be brought to trial. Though completely defeated in 1821, French Carbonarism did not die out, but continued to be an active centre of revolutionary discontent till 1830, when, after contributing to the July revolution, most of the members adhered to the government of Louis Philippe. For several years after, traces of it existed in some French towns, but these are of no importance.

Heckethorn's *Secret Societies*; Botti's *History of Italy*, vol. ii.; Alison's *History of Europe*, vol. ii.: *Annuaire Historique*.

CARBONDALE, a city of the United States, in the county of Luzerne in Pennsylvania, near the source of the Lackawanna River, on the Delaware and Hudson Railway, about 110 miles N.N.W. of Philadelphia. Its incorporation only dates from 1851, and (as its name implies) its principal importance consists in the fact that it is the centre of an extensive coal-field. About 900,000 tons are obtained annually from the neighbouring mines. Population in 1850, 4945; in 1870, 6393.

CARBUNCLE is a name applied in modern times to the various kinds of garnet employed by jewellers when cut *en cabochon*, that is, with a smooth convex surface, and the back either flat or hollowed out. On account of the deep red colour of most garnets it is necessary to adopt this kind of cutting, especially when the stones are of any considerable size, in order to exhibit their rich hues by the light passing through a comparatively thin stratum of the material. The carbuncle is frequently mentioned in the Bible, although it is impossible to define the precise stone referred to under that name in the Authorized Version of the Scriptures. The stone in the breast-plate of the High Priest, which is translated carbuncle (Exodus xxviii. 17), is in the original called Bereketh, literally meaning flashing, while again, in Isaiah liv. 12, the term Kadkod, equivalent to the glowing of fire, is also rendered by carbuncle. The *carbunculus* of Pliny appears to have included all the deep-red coloured stones which were suitable for jewellery and gems, such as the ruby and the

spinell; as well as the various kinds of garnet. It is remarkable that among the varieties distinguished by classical writers were the *lychnis* or lamp stone, and the *ἀνθραξ* or live coal, both in common with the scriptural names indicating stones with a fiery glow. In the setting of carbuncles, a ruby-like glow is frequently communicated to the stones by a backing of coloured metallic foil which modifies their hue, a practice which is found to have prevailed in Roman times, *tanta est in illis occasio artis, subditis per que transluere cogantur*. The finest carbuncles come from Pegu and Ceylon, and they are sometimes found in masses of such dimensions that cups measuring as much as one and a half or two inches in height and diameter are cut out of them. See under GARNET.

CARBUNCLE, an acute local inflammation of the deeper layers of the skin, followed by sloughing. It is met with in those who are weakened by any cause, and in certain unhealthy constitutional states. It is accompanied by great constitutional disturbance; in the early stages of the disease the pain is considerable. A hard flattened swelling of a deep red colour is noticed on the back, face, or extremities. This gradually extends until in some instances it may become as large as a dinner-plate. Towards the centre of the mass numerous small openings form on the surface. From them blood and matter escape, and through these openings a yellow slough, of leathery consistence, can be seen. The treatment generally adopted is free incisions through the mass, relieving the tension and alleviating the pain. Pontties are then applied to encourage the separation of the slough. After this comes away a healthy ulcer is left which heals rapidly, leaving an indelible scar. Opium is given in order to relieve the pain. The patient requires supporting diet, stimulants, good food, and the administration of iron. Occurring as it does in people of an unhealthy tendency, it may in severe cases occasion death. Some surgeons do not interfere with the knife, but give opium in large doses, and allow the slough to separate by natural processes.

CARCAJENTE, a town of Spain, in the province of Valencia, $2\frac{1}{2}$ miles from the right bank of the Júcar, in $39^{\circ} 4' N$ lat. and $3 31' W$ long., with a station on the railway between Valencia and Almansa. It is inhabited chiefly by an agricultural population, but has a considerable manufacture of linen and woollen stuffs, and silk thread from the silk produced in the neighbourhood. The town-house (a modern building), the parish church, and the palace of the marquis of Calzada are its principal buildings. Roman remains have been found in the vicinity. Population, 8850.

CARCASSONNE, the chief town of the department of Aude, in France, is situated on both sides of the River Aude, and in the immediate neighbourhood of the Canal du Sud, about 55 miles S.E. of Toulouse, on the railway between that city and Narbonne, in $43^{\circ} 12' 54'' N$ lat. and $2^{\circ} 20' 55'' E$ long. On an abrupt elevation on the right bank of the river stands the old city, enclosed by a double line of ramparts and towers, and retaining the aspect of a mediæval fortress. A portion of the inner line is attributed to the Visigoths; the rest, including the castle, seems to belong to the 11th or 12th century, while the outer circuit has been referred mainly to the end of the 13th. The old cathedral of St Nazaire, which partly dates from the 11th century, and contains magnificent stained-glass windows of the Renaissance period, has been restored under the superintendence of M. Viollet-le-Duc. On the left bank of the river, but connected with the city by a bridge of twelve arches, lies the new town, clean, well-built, and flourishing, with streets intersecting each other at right angles. It is surrounded by boulevards occupying the site of its ramparts, and has a large esplanade

for military manoeuvres, as well as numerous fountains and planted walks. As chief town of a department, and the seat of a bishop, Carcassonne contains court-houses and various public offices, an episcopal palace, and a theological seminary; and among its other public buildings and institutions may be mentioned the new cathedral of St Michael, the town-hall, the library with upwards of 15,000 volumes, the exchange, the theatre, the barracks, the hospitals, the college, the school of design, the museum, the chamber of commerce, and the agricultural society. Of the various industrial establishments the most important are the woollen factories,—not less than 2000 people being engaged in the manufacture of cloth, which is chiefly exported to the Levant, Barbary, and South America. Wadding, paper, leather, pottery, and iron wares are also produced; and there is a trade in wine, brandy, and fruit. A large fair is held in November and another on Whit-Tuesday. Population in 1872, 20,808 in the town. and 23,644 in the commune.

Carcassonne occupies the site of *Carcaso*, an ancient city of Gallia Narbonensis, which belonged to the Volcæ Tectosages. It was a place of some importance at the time of Cæsar's invasion, but makes almost no appearance in Roman history. On the disintegration of the empire, it fell into the hands of the Visigoths, who, in spite of the attacks of the Franks, especially in 585, retained possession till 724, when they were expelled by the Saracens, destined in turn to yield before long to Charles Martel. From the 9th to the beginning of the 13th century Carcassonne formed a separate countship, which was brought to ruin by the attachment of Count Raymond Roger to the cause of the Albigenes. The city, in spite of a noble defence, was taken by the Crusaders of Simon de Montfort in 1209, and the unfortunate count perished in captivity. In 1224, his son, Raymond Trencavel II., recovered his estates, but in 1247 he was forced to yield all his rights to Philip Augustus. A revolt of the city against the royal authority was severely punished in 1262, by the expulsion of its principal inhabitants, who were, however, permitted to take up their quarters on the other side of the river. This was the origin of the new town, which was fortified in 1347. During the religious wars Carcassonne several times changed hands, and it did not recognise Henry IV. till 1596.

CARDAMOM, the fruit of several plants of the genera *Elettaria* and *Amomum*, belonging to the natural order Zingiberaceæ, the principal of which is *Elettaria Cardamomum*, from which the true officinal or Malabar cardamom is derived. The Malabar cardamom plant has flag-like leaves, springing from an erect perennial stem, and rising to a height of from 6 to 12 feet. The fruit is an ovate-triangular three-celled three-valved capsule of a dirty yellow colour, enclosing numerous angular seeds, which form the valuable part of the plant. It is a native of the mountainous parts of the Malabar coast of India, and the fruits are procured either from wild plants or by cultivation throughout Travancore, Western Mysore, and along the Western Ghats. A cardamom of much larger size found growing in Ceylon was formerly regarded as belonging to a distinct species, and described as under the name of *Elettaria major*; but it is now known to be only a variety of the Malabar cardamom. In commerce, several varieties are distinguished according to their size and flavour. The most esteemed are known as "shorts," a name given to such capsules as are from a quarter to half an inch long and about a quarter broad. Following these come "short-longs" and "long-longs," also distinguished by their size, the largest reaching to about an inch in length. The Ceylon cardamom attains a length of an inch and a half and is about a third of an inch broad, with a brownish pericarp and a distinct aromatic odour. Among the other plants, the fruits of which pass in commerce as cardamoms, are the round or cluster cardamom, *Amomum Cardamomum*, a native of Siam and Java; the bastard cardamom of Siam, *A. xanthioides*; the Bengal cardamom, which is the fruit of *A. aromaticum*; the Java cardamom, produced by *A. maximum*; the Nepal cardamom, and the Korarima

cardamom of East Africa, the last two not being yet botanically described. Cardamoms generally are possessed of pleasant aromatic odour, and an agreeable spicy taste. On account of their flavour and stimulant properties they are much used with other medicines, and they form a principal ingredient in curries and compounded spices. In the North of Europe they are much used as a spice and flavouring material for cakes and liqueurs; and they are very extensively employed in the East for chewing with betel, &c.

CARDAN (or, in the Italian form of the name, CARDANO), GIROLAMO (1501–1576), famous as a mathematician, a physician, and an astrologer, born at Pavia, September 24, 1501, was the illegitimate son of Fazio Cardano, a learned jurist of Milan, himself distinguished by a taste for mathematics. After a sickly childhood and a stormy boyhood, during which he received a very irregular education, he was sent to the university of Pavia, and subsequently to that of Padua, where he graduated in medicine. He was, however, excluded from the College of Physicians at Milan on account of his illegitimate birth, and his first endeavours to establish himself in practice had so little success that he and his young wife were at one time compelled to take refuge in the workhouse. It is not surprising that his first book should have been an exposure of the fallacies of the faculty. A fortunate cure of the child of the Milanese senator Sfondrato now brought him into notice, and the interest of his patron procured him admission into the medical body. About this time (1539) he obtained additional celebrity by the publication of his *Practice of Arithmetic*, a work of great merit for the time, which indirectly led to his renown as a mathematician by engaging him in a correspondence with Nicolo Tartaglia, an ingenious calculator who had discovered an important improvement in the method of cubic equations. This discovery Tartaglia had kept to himself, but he was ultimately induced to communicate it to Cardan under a solemn promise that it should never be divulged. Cardan observed this promise in publishing his arithmetic, but when, several years afterwards, the isolated rule of Tartaglia had developed itself in his mind into a principle capable of transforming algebraical science, he thought himself justified in disclosing it as the groundwork of his own comprehensive treatise on algebra, which appeared at Nuremberg in 1545. This memorable volume marks an era in the history of mathematics, being the first in which the principle of cubic equations was fully explained, and the first example of the application of algebraical reasoning to geometrical problems. Its publication naturally involved Cardan in a violent controversy with Tartaglia, and it must be admitted that his conduct cannot be strictly justified, notwithstanding his ample acknowledgment of his obligations to his original instructor. Two years previously he had published a work even more highly regarded by his contemporaries, his celebrated treatise on astrology. This will hardly be enumerated in our day among his titles to fame, but it would be exceedingly unjust to regard it as a proof of superstition or weakness of mind. As a believer in astrology Cardan was on a level with the best minds of his age; the distinction consisted in the comparatively cautious spirit of his inquiries and his disposition to confirm his assertions by an appeal to facts, or what he believed to be such. A very considerable part of his treatise is based upon observations carefully collected by himself, and, it must in candour be owned, seemingly well calculated to support his theory so far as they extend. If the testimony is nevertheless quite inadequate to its purpose, it must in fairness be considered that the proposition of the influence of the heavenly bodies on human affairs appeared to Cardan's contemporaries almost a truism. From this point of view it may be understood that the book should have been intended by

the author as a contribution to natural science, and should be almost entirely free from the superstitious whims and hallucinations which, while leaving his faculties as a thinker and a natural philosopher almost unaffected, frequently misled him in the affairs of practical life. Numerous instances of his belief in dreams and omens may be collected from his writings, and he especially valued himself on being one of the five or six celebrated men to whom, as to Socrates, had been vouchsafed the assistance of a guardian dæmon.

Cardan's authorship may have interfered with his medical practice, and he himself ingenuously confesses that he and his family were mainly supported during a considerable part of this period by the complaisance of a Milanese patrician, who allowed him to win of him at play. The sudden loss of this resource reduced him for a time to penury, from which he was extricated by receiving the appointment of professor of medicine at Pavia. The publication of his works on algebra and astrology at this juncture gave him a European renown, and procured him flattering offers from Pope Paul III and the king of Denmark, both of which he declined. In 1551 his reputation was crowned by the publication of his great work *De Subtilitate Rerum*, which, erudite and fanciful as it may now appear, in his own age embodied the soundest physical learning of the time and simultaneously represented its most advanced spirit of speculation. It was followed some years later by a similar treatise *De Varietate Rerum*, the two making in effect but one book. A great portion of this is occupied by endeavours, commonly futile, to explain ordinary natural phenomena, but its chief interest for us consists in the hints and glimpses it affords of principles beyond the full comprehension of the writer himself, and which the world was then by no means ready to entertain. The inorganic realm of Nature he asserts to be animated no less than the organic; all creation is progressive development; all animals were originally worms; the inferior metals must be regarded as *conatus naturæ* towards the production of gold. The indefinite variability of species is implied in the remark that Nature is seldom content with a single variation from a customary type. The oviparous habits of birds are explained by their tendency to favour the perpetuation of the species, precisely in the manner of modern naturalists. Animals were not created for the use of man, but exist for their own sakes. The origin of life depends upon cosmic laws, which Cardan naturally connects with his favourite study of astrology. The physical divergencies of mankind arise from the effects of climate, and the variety of human circumstances in general. Cardan's views on the dissimilarity of languages are much more philosophical than usual at his time; and his treatise altogether, though weak in particular details, is strong in its pervading sense of the unity and omnipotence of natural law, which renders it in some degree an adumbration of the course of science since the author's day. It was attacked by J. C. Scaliger, whom Cardan refuted without difficulty.

The celebrity which Cardan had acquired led in the same year (1551) to one of the most interesting episodes of his life, his journey to Scotland as the medical adviser of Archbishop Hamilton of St Andrews. The archbishop was supposed to be suffering from consumption, a complaint which Cardan, under a false impression, as he frankly admits, had represented himself as competent to cure. Failing to meet his patient at Lyons as had been arranged, he was induced to continue his journey to Scotland. He was of great service to the archbishop, whose complaint proved to be asthmatical; but the principal interest attaching to his expedition is derived from his account of the disputes of the medical faculty at Paris, and of the court of Edward

VI. of England, particulars which he had an opportunity of observing in going and returning. The Parisian doctors were disturbed by the heresies of Vesalius, who was beginning to introduce anatomical study from the human subject. Cardan's liberality of temper led him to sympathize with the innovator. His account of Edward VI.'s disposition and understanding is extremely favourable, and is entitled to credit as that of a competent observer without bias towards either side of the religious question. He cast the king's nativity, and indulged in a number of predictions which were effectually confuted by the royal youth's death in the following year. His impressions of England seem to have been very pleasant.

Cardan had now attained the summit of his prosperity, and the rest of his life was little but a series of disasters. His principal misfortunes arose from the crimes and calamities of his sons, one of whom was an utter reprobate, while the tragic fate of the other overwhelmed the father with anguish. This son, Giovanni Battista, also a physician, had contracted an imprudent marriage with a girl of indifferent character, Brandonia Seroni, who subsequently proved unfaithful to him. The injured husband revenged himself in the Italian fashion with poison; the deed was detected, and the exceptional severity of the punishment seems to justify Cardan in attributing it to the rancour of his medical rivals, with whom he had never at any time been on good terms. He exerted himself greatly as his son's advocate, but to no purpose. The blow all but crushed him; his reputation and his practice waned; he addicted himself to gaming, a vice to which he had always been prone; his mind became unhinged, and filled with distempered imaginations. He was ultimately banished from Milan on some accusation not specified, and although the decree was ultimately rescinded, he found it advisable to accept a professorship at Bologna (1563). While residing there in moderate comfort, and mainly occupied with the composition of supplements to his former works, he was suddenly arrested on a charge not stated, but in all probability heresy. Though he had always been careful to keep on terms with the Church, the bent of his mind had been palpably towards free thought, and the circumstances had probably attracted the attention of Pius V., who then ruled the Church in the spirit, as he had formerly exercised the functions, of an inquisitor. Through the intercession, as would appear, of some influential cardinals, Cardan was released, but was deprived of his professorship, prohibited from teaching and publishing any further, and removed to Rome, where he spent his remaining years in receipt of a pension from the Pope. It seems to have been urged in his favour that his intellect had been disturbed by grief for the loss of his son,—an assertion to which his frequent hallucinations lent some countenance, though the existence of any serious derangement is disproved by the lucidity and coherence of his last writings. He occupied his time at Rome in the composition of his commentaries *De Vita Propria*, which, along with a companion treatise *De Libris Propriis*, is our principal authority for his biography. Though he had burned much, he left behind him more than a hundred MSS., not twenty of which have been printed. He died on September 20, 1576.

Alike intellectually and morally, Cardan is one of the most interesting personages connected with the revival of science in Europe. He had no especial bent towards any scientific pursuit, but appears as the man of versatile ability, delighting in research for its own sake, and capable of prosecuting it to great lengths by dint of perseverance and sagacity. He possessed the true scientific spirit in perfection; nothing, he tells us, among the king of France's treasures appeared to him so worthy of admiration as a certain natural curiosity which he took for the

horn of a unicorn. It has been injurious to his fame to have been compelled to labour, partly in fields of research where no important discovery was then attainable, partly in those where his discoveries could only serve as the stepping-stones to others, by which they were inevitably eclipsed. His medical career serves as an illustration of the former case, and his mathematical of the latter. His medical knowledge was wholly empirical; restrained by the authority of Galen, and debarred from the practice of anatomy, nothing more could be expected than that he should stumble on some fortunate nostrums. As a mathematician, on the other hand, he effected most important advances in science, but such as merely paved the way for discoveries which have obscured his own. From his astrology no results could be expected; but even here the scientific character of his mind is displayed in his common sense treatment of what usually passed for a mystical and occult study. His prognostications are as strictly empirical as his prescriptions, and rest quite as much upon the observations which he supposed himself to have made in his practice. As frequently is the case with men incapable of rightly ordering their own lives, he is full of wisdom and sound advice for others; his ethical precepts and practical rules are frequently excellent. To complete the catalogue of his accomplishments, he is no contemptible poet.

The work of Cardan's, however, which retains most interest for this generation is his autobiography, *De Vita Propria*. In its clearness and frankness of self revelation this book stands almost alone among records of its class. It may be compared with the autobiography of another celebrated Italian of the age, Benvenuto Cellini, but is much more free from vanity and self-consciousness, unless the extreme candour with which Cardan reveals his own errors is to be regarded as vanity in a more subtle form. The general impression is highly favourable to the writer, whose impetuosity and fits of reckless dissipation appear as mere exaggerations of the warmth of heart which imparted such strength to his domestic affections, and in the region of science imparted that passionate devotion to research which could alone have enabled him to persevere so resolutely, and effect such marked advances in such multifarious fields of inquiry.

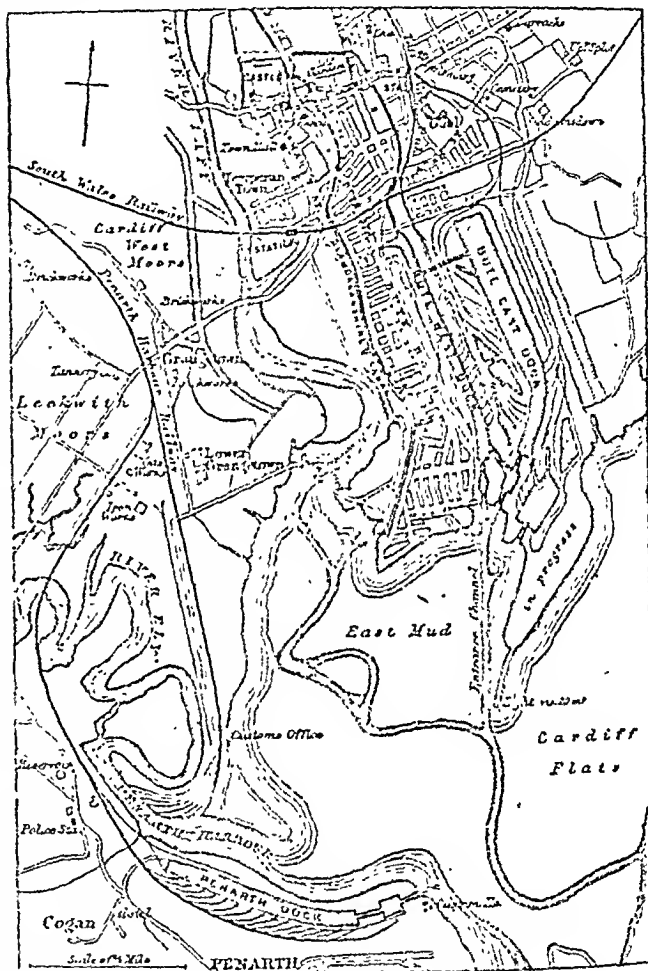

Cardan's autobiography has been most ably condensed, and at the same time supplemented by information from the general body of his writings and other sources, by Professor Henry Morley (*Jerome Cardan*, 1854, 2 vols.). His capital treatises *De Subtilitate* and *De Varietate Rerum* are combined and fully analyzed in vol. ii. of Rixner and Siber's *Leben und Lehrmeinungen berühmter Physiker am Ende des xvi. und am Anfange des xvii. Jahrhunderts* (Sulzbach, 1820). Cardan's works were edited in ten volumes by Sponius (Lyons, 1663). A biography was prefixed by Gabriel Naudé, whose unreasonable depreciation has unduly lowered Cardan's character with posterity. (R. G.)

CARDENAS, a maritime town of the island of Cuba, capital of a district in the western department, is situated 105 miles E. of Havana, on a bay of the northern coast, and has railway communication with Matanzas and Mont-alvo. There is good anchorage in the harbour, and a number of long wharves stretch out from the shore. The most important article of export is the sugar from the neighbouring district,—of which, in 1873, 13,096 tons were sent to Europe, and 69,364 to America. Though only founded in 1828, Cardenas had in 1861 12,910 inhabitants; and at present, in spite of the troubled condition of the island, the number is calculated at about 11,000, of whom 7700 are whites, 2800 slaves, and the rest free negroes. In 1850 the town was plundered by general Lopez.

CARDIFF (the "Caer," or castle on the Taff), a municipal and parliamentary borough in the county of Glamorgan, 170 miles from London by the Great Western Railway, in 51° 28' N. lat. and 3° 10' W. long. This town is

the chief emporium of the coal and iron trade of South Wales, and is remarkable for its rapid progress and development. The population of the parliamentary borough, by the census of 1871, was 56,911 and since that date it has largely increased. There is a striking contrast of dirty narrow thoroughfares and the wide streets of new houses now opening up in the modern quarter of the town.

Historically, Cardiff is well known, but the castle remains and the old church of St John and its noble pinnacled tower are almost the only remnants of antiquity. The ancient walls and gates, Blackfriars and Greyfriars, have been swept away, and the old church of St Mary, finer than any local churches that succeeded was washed

Plan of Cardiff.

away by the sea. The Arthurian legend of the Sparrowhawk refers to Cardiff. Its position between the rivers Taff and Rhymney, and also between the mountains and the sea, marked it out, probably for the Romans, certainly for the Normans, as a fortified station. In the year 1108 Henry I. having taken prisoner his brother Robert duke of Normandy, imprisoned him in Cardiff Castle for twenty-six years until his death in 1134. Contrary to the prevalent tradition he was most probably treated with kindness, and permitted at times to change his abode. In the time of the Civil War Charles I. came to Cardiff, and the castle was alternately occupied by Royalists and Parliamentarians. There was severe fighting at St Fagan's in the neighbourhood. In 1661 we find the Cardiff authorities complaining of being ruined by the competition of the neighbouring town of Caerphilly, but Caerphilly Castle is ruined and the town decayed, while Cardiff has greatly flourished. The local histories are full of the succession of different owners of the castle until the lordship of Glamorgan passed by marriage to the Bute family. The castle occupies

a quadrangular space, and was probably once surrounded by earthworks, except towards the river. The area within the walls was 10 acres, within the counterscarp of the moat 13 acres. The mound within the great enclosures has the remains of the keep, or the White Tower. On the town or south side of the court are the Black or Curthose tower, the scene of Duke Robert's imprisonment, and the gateway. The castle was once of enormous strength, and so constructed to resist the incursions of the Welsh. The lodgings or habitable part are now undergoing extensive demolition and reconstruction. Under the advice of "Capability Brown" the whole structure was modernized, and many precious remains swept away. A thorough restoration is now in progress under the care of Mr Burgess. The new clock tower is a gorgeous example of most thorough ornamentation. On the side of the Taff, opposite to the castle grounds, are the Sophia Gardens, given to the town by the late marchioness of Bute.

There is a great deal of activity and public spirit in Cardiff. The gas, sanitary, and water arrangements are excellent. There are both public library and infirmary, and plans for new and enlarged buildings for both institutions are in progress. The exports of Cardiff are almost entirely coal and iron; the imports, insignificant in comparison, are mainly iron ore, esparto fibre for paper-making, timber, and corn.

At the commencement of the present century Cardiff possessed a population which scarcely amounted to 1000, and was not even called a port. It was simply designated as a "creek" attached to the great port of Bristol. The peculiar resources of the district were not unknown or neglected, and it is interesting to notice the first rudimentary steps in their development. Coal was brought down from the hills and valleys on the backs of mules. The burdens were laid down at a primitive quay, where vessels of small tonnage awaited them to carry the cargo to Bristol or other ports. The iron was transported in waggons of 2 tons, and to avoid delays from frost, snow, and storms, the minerals, as much as possible, were brought down in the summer and stocked for the winter. In the American War guns made by contract were brought down to the primitive quay which long retained the name of Cannon Wharf. The first stage in the progress of the town was marked by the construction of the Glamorganshire Canal from Merthyr Tydvil to the sea. It dropped from lock to lock some 500 feet in the course of its 25 mile journey to a certain seapond capable of holding vessels of 200 tons burden. The dock had only been formed a few years when the second marquis of Bute came into possession of his Welsh property. He held some 25,000 acres of the Glamorganshire hills, teeming with mineral treasures, and between Cardiff and the shore line he owned a tract of marshy waste. It is to the Bute family that Cardiff is mainly indebted for its prosperity. Lord Bute contemplated the construction of large docks, and in the course of twenty years he made great progress with his plans, staking, it is said, the whole of his fortune on the result.

In 1830 the first bill was obtained for the construction of a dock, which has been truly termed the "cradle" of Cardiff. The waters of the Taff were partially diverted as a "feeder" for an artificial stream. There was considerable difficulty in connecting the dock, which was considerably above low-water mark with the waters of the channel, but these were overcome by Sir William Cubitt. In 1839 the west dock was opened with great rejoicings. It became evident that additional accommodation would soon be required. The lucrative Taff Vale Railway had been formed, incessantly pouring the mineral treasures of the hills into the harbour of Cardiff, and the western side of the dock was ceded to their use. This company also

promoted a dock under the headland of Penarth. Later, the Rhymney Railway was constructed, and gave additional development to the coal trade. The great marquis, the second founder of Cardiff, who died somewhat suddenly in 1848, provided that the contingency of his death should not disturb his schemes. He left his estates in trust, nominally for fifteen hundred years, for carrying out his design for making Cardiff a great seaport. The trustees during the twenty years' minority of his successor achieved great works. It was resolved in 1851 that the east dock should be commenced. The demand for accommodation increased so rapidly that the plan of the dock was repeatedly enlarged. This second dock covers 45 acres; the width is partly 300, and partly 500 feet; the total length is 4300 feet, the width of the sealock is 55 feet; the length between the gates is 220 feet. In 1864 further schemes of enlargement were brought forward. In 1868 a low-water pier was opened by Lord Bute on his coming of age. In 1874 a south basin was opened; its area is twelve acres, and the iron-wrought gates have a larger superficial area than any similar works in existence. The new basin acts as a dock, and in some degree relieves the pressure for accommodation until the contemplated additional dock is constructed. The scene on the wharves is very stirring. There is a network of railways about the docks, giving direct communication to every part of the kingdom. The railways bring the minerals from the mouths of the pits; there are enormous stiths, hydraulic lifts being often used for shipping the coals, and steam-cranes to discharge the enormous ballast of arriving ships. What Cardiff needs for its full development is an import trade, in the place of the ballast, but attempts in this way have not hitherto been very successful, and the New York line of steamers has been given up. Cardiff remains the greatest entrepôt for the smokeless coal which has been found the best for steamers in all the navies of the world, and in export ranks next to Newcastle. The docks owe all their importance to the minerals on the hills, and the means of transit that have been devised from the hills to the shore. The expenditure on the docks, including the new works, will be from two to three millions; the expenditure on railways is about the same, and the capital invested in the collieries is about twenty-five millions. The business of the port, though subject to fluctuations, steadily increases. In 1839 the amount of iron shipped at the port was 1200 tons, and of coal 4562. In 1848 the shipments of iron had advanced to 70,805 tons, and those of coal to 615,111 tons. In 1870, however, the weight of iron loaded at Cardiff amounted to 315,649 tons, and that of coal and patent fuel, which in the meantime had become an article of export, to 2,177,518 tons. The amount of coal exported in 1871 was 2,979,843 tons, and in 1872, 3,557,246 tons.

The villages in the neighbourhood of Cardiff,—Roath, Maindu, Canton, Llandaff,—are now its suburbs and nearly absorbed in the town. Of these the most interesting is Llandaff, a kind of minor Clifton to Cardiff. The remarkable cathedral, the seat of the earliest English bishopric, gives the tiniest city in Britain its title. It is a little old-world village on the outskirts of Cardiff, with the Coplestone cross, the remains of the bishop's fortified palace, superseded by a modern country-house and a group of neat ecclesiastical buildings. For more than a hundred years the cathedral was left to neglect and decay. The aisles were roofless, grass grew in the nave, the ivy came through the windows, and storms were increasingly laying waste the edifice. At the expense of many thousand pounds a satisfactory restoration was effected, and a re-opening took place in 1869. The cathedral is nobly situated near the Taff, where it is broad and wooded, and almost entirely screened by the ridges. (F. A.)

CARDIGAN, COUNTY OF, or CARDIGANSHIRE, a maritime county in South Wales, is bounded on the N. by Merioneth, on the E. by Montgomery, Radnor, and Brecon, on the S. by Carmarthen and Pembroke, and on the W. by the Irish Sea. Its greatest length from south to north is about 30 miles, and its greatest breadth from east to west about 40 miles; but these dimensions give a very imperfect idea of its size, as it almost exactly represents in figure a "half-boot," the line of the sole being from east to west, with the toe at the extreme west. It possesses an area of 693 square miles, or 443,387 acres, and is, therefore, the fifth in size of the Welsh counties.

The whole area of this county is occupied by the lower Silurian geological formation. It does not, therefore, possess mines of coal, or iron, or limestone; but, as if to compensate for this want, it is the richest of all the Welsh counties in its metalliferous lodes. Its lead mines have long been famous; and it was from the profits of his mining speculations, carried on chiefly in this county, that the celebrated Sir Hugh Myddelton was enabled to carry out his gigantic project for supplying London with water, by means of the New River. The Lisburne, Goginan, Cwm Ystwith, and other mines still yield largely, and have been sources of great profit to the adventurers. Some of the lead raised is very rich in silver; and in the 17th century the quantity of silver obtained was so considerable, that, by virtue of letters-patent, a mint existed for coining it on the spot.

Cardiganshire is exceedingly wild and mountainous; but the mountains generally have little of grandeur in their character, Plinlimmon itself, in spite of its height, being singularly deficient in boldness of outline. There is a considerable tract of flat land lying along the sea coast, especially towards the south-west, the general aspect of which is so dreary and desolate, that it has been called, and with good reason, the desert of Wales. In that district it is almost possible to travel 30 miles in a straight line without seeing a house, or a road, or a human being. The principal mountains are Plinlimmon, just within the county boundary on the north-east, rising to the height of 2469 feet, and Tregaron mountain, near Tregaron, in the south-east, 1778 feet in height. Few of the others exceed 1000 feet in elevation.

The vale of Teifi presents views of great beauty and interest, especially as it approaches the sea. The valleys of the Aeron, the Ystwith, and the Rheidol, also present scenes of great beauty, especially the last, in which is the famous Devil's Bridge, with the falls of the Rheidol, one of the most celebrated pieces of Welsh scenery.

The county abounds in lakes and rivers. The chief of the latter is the Teifi, which rises in a lake of the same name (Llyn Teifi), about 8 miles north-east of Tregaron; flowing through the centre of the county, in a south-west direction, till it reaches Lampeter, it becomes from that point the county boundary, separating it from Carmarthen and Pembroke, and, after a course of about 50 miles from its source, falls into the sea at Cardigan. The Aeron takes its rise in some lakes in a low range of hills called Mynydd Bach, and first flowing in a southerly direction, and afterwards nearly west, falls into the sea at Aberaeron. The Ystwith and Rheidol both rise in Plinlimmon, and flowing west, cross the county, falling into the sea at Aberystwith; and the Towy forms the county boundary, separating it from Brecknockshire on the south-east.

Cardiganshire has been called the lake county of Wales, an appellation which it well deserves. The most important are Llyn Teifi, Llyn Fyrddyn Fawr, Llyn Egnant, Llyn Gynon, and Llyn Eiddwen; but hardly any of them exceeds three-quarters of a mile in length. They abound in trout, and are now a good deal resorted to by anglers.

The climate on the coast is mild and salubrious, but suffers from an excess of rain. The climate of the hill country is cold, wet, and bleak. The cultivated crops consist of wheat, oats, barley, turnips, and potatoes; and in the lower districts on the coast, especially in the neighbourhood of Aberaeron, Llanrhystyd, and Cardigan, good crops are raised; and at the last-named, as well as at Lampeter, great improvements are now being effected, by means of the Government Drainage Bill, in draining and improving several large estates. In 1873 there were 2038 holdings of an acre and upwards, and 1278 of less size,—the average extent being 118 acres, while that of all Wales is 74½ acres. Seven holdings exceeded 5000 acres, and none extended to 30,000 acres. It is calculated that one-half of the lands are enclosed. The hill district is entirely occupied with wild heathy pastures, which are stocked with the small mountain sheep of the country, and with herds of ponies and cattle, which are annually drafted off by dealers to be fattened in the more fertile districts of Wales or England. Cardiganshire has long been famous for its breed of horses, and for these high prices are obtained from English dealers, who now visit the farms in considerable numbers.

The following tables show the acreage of particular crops, and the numbers of live stock in the years 1872 and 1875:—

	Oats.	Barley.	Wheat.	Green Crops.	Grass under rotation.
1872....	31,411	25,849	8430	14,739	40,505
1875....	30,540	24,366	8459	13,653	37,991
	Horses.	Cattle.	Sheep.	Pigs.	
1872.....	11,762	56,565	203,619	23,739	
1875.....	12,745	61,535	205,346	20,688	

Black cattle, sheep, pigs, butter, barley, oats, woollen manufactures, slates, and lead and lead ore form the principal articles of export.

The railways within the county are the Cambrian, by means of which access is given to Aberystwith from all parts of the kingdom, and a line through Tregaron and Lampeter, and by way of Pencader to Carmarthen. At present the county town is without any railway communication.

The principal towns are—Cardigan, Aberaeron (at which, in consequence of its central situation, the county sessions are held), Aberystwith, Llanbadarn Fawr, Tregaron, Lampeter, and Adpar,—which last is the name given to the portion of Newcastle Emlyn on the Cardigan side of the Teifi. The county, which contains 97 parishes, is in the diocese of St David's; and at Lampeter there is a college for the education of the Welsh clergy. It returns one member to Parliament, and has done so since 1536. The political influence is divided between the families of Powell of Nant-Eos (Conservative) and Pryse of Gogerddan, Pryse of Peithyll, Lloyd of Coedmore, and the earl of Lisburne (Liberal). Constituency in 1875, 4563. The annual value of real property paying income tax is £256,078.

The population of the county by the census of 1871 was 73,441, giving an average of 105·2 persons to a square mile, or 6·3 acres to each person. Of the total number 33,396 were males, and 40,045 females, showing an unusual disproportion of the sexes, in the great excess of females. This may be perhaps accounted for by the emigration of men to the mining districts, especially Glamorganshire, where the excess of males would just balance the deficiency in Cardigan, Carmarthen, and Pembroke. The number of inhabited houses in 1871 was 16,420, uninhabited 741, and building 76,—giving an average of 23·6 inhabited houses to a square mile, and 4·4 persons to each house. The following table gives the census returns for the last fifty years:—

1821	57,784	1851	70,796
1831	64,780	1861	72,245
1841	68,766	1871	73,441

The women may often be seen dressed in the picturesque costume of Wales, and having their heads surmounted by the high-crowned broad-brimmed hat. Many curious customs and superstitions still survive. On the occasion of a marriage, a "bidder" goes from house to house inviting the inmates to the wedding. It is expected that all the guests are to bring presents of money and provisions. The marriage always takes place on a Saturday; but the guests assemble on Friday with their presents. All these are set down on paper, that repayment may be made if demanded; but this seldom happens. The furnishing of the bride is also brought home on this day. On Saturday ten or twenty of the man's friends who are best mounted go to demand the bride. She is placed on a horse, behind her father, who rides off as fast as he can. He is soon, however, overtaken. Presents continue to be received on Saturday and Sunday, and on Monday they are sold, and sometimes with the money received realize £50 or £60.

There are numerous British and Roman antiquities in the county, consisting of cromlechs, tumuli, camps, and stations, and also the remains of a Roman road (the *Sarn Helen*) about four miles from Tregaron, and the Roman town *Loventium* at Llanio.

The castles of Aberystwith, Cardigan, and Newcastle Emlyn are interesting ruins, and the remains of Strata Florida Abbey are among the most beautiful of the ecclesiastical antiquities of South Wales. The church of Llanbadarn Fawr (once the seat of a bishopric) is a fine example of a severe type of Early English architecture, and the collegiate church of Llanddewi Brefi marks the site of the synod in which, according to the legend, St David confuted the Pelagians.

The early history of the district is obscure, but at the time of the Roman invasion it was tenanted by the Demetæ, a Celtic tribe, within whose limits was comprised the greater portion of the south-west of Wales. Mingled with it, though living at perpetual variance, was a Gaelic population (drawn, probably, from Ireland), which in the 6th century had got the upper hand, and in turn was subdued by the sons of Cunedda, who came as liberators from North Britain. One of these sons was Caredig, who conquered and gave the name to the province of Ceredigion, which was nearly co-extensive with the present county of Cardigan. In the 8th century it formed part of the dominion of Sitsylt (from whom it received the name of Seissyltwg), and was hotly disputed by the descendants of his sons and daughter. Ultimately it fell to the latter, and at the close of the 11th century had been reduced to submission to the Norman sway, from which, in spite of short-lived successes, it never escaped.

Cardigan was one of the counties involved in the singular disturbances known as the Rebecca riots.

CARDIGAN, a market town and municipal and parliamentary borough of England, the capital of the county of the same name, is situated on the south-east of Cardigan Bay, about 36 miles by rail from Carmarthen, at the mouth of the Teifi, which there divides the county from Pembrokeshire. The houses are mostly constructed of slate rock; and the streets are narrow, steep, and irregular. The principal structures are the church of St Mary's, a fine and spacious edifice of considerable antiquity, the county jail, erected in 1793, the national school dating from 1848, and a large block of buildings which includes a town hall, an exchange, a grammar school, a public library, and various markets. Besides being the commercial centre of a pretty extensive district, Cardigan engages in the coasting trade and the fisheries, and exports slates, oats, barley, and butter. Its harbour is unfortunately obstructed by a bar, so that the entrance is dangerous for vessels of more than 300 tons burden, except at high spring tides, when it is

passable for vessels drawing 15 to 18 feet of water. The imports in 1874 were valued at £3035, the exports at £52. The borough, in conjunction with Aberystwith, Lampeter, and Adpar, has returned one member to Parliament since 1836; and in 1874 the district had a constituency of 1981. The population in 1871 was 3461 in the municipal borough, and 4939 in the parliamentary, which is partly in Pembrokeshire.

Cardigan, called by the Welsh *Aberteifi*, from its position at the mouth of the river, first rose into importance about the time of the Norman conquest. In 1136 the English army, under Randolph, earl of Chester, suffered a severe defeat in the neighbourhood at the hands of the Welsh. The town was fortified by Rhys ap Gryllydd, prince of South Wales, to whom was also ascribed the foundation of the castle, which is still represented by a few ruins near the bridge. His grandson Maelgwn razed the castle to the ground, and ravaged the town; but the effects of his vengeance were not long after repaired, and the castle continued to be a post of some importance down to the Parliamentary wars, when it was held for a while by the Royalist forces. In the neighbourhood there was, before the Reformation, a small priory of Benedictine monks, which, as a private dwelling in the 17th century, obtained some celebrity as the residence of Orinda (Catherine Philips), the friend of Jeremy Taylor. About a mile and a half distant was the more important priory of St Dogmael; and about three miles up the river are the ruins of Cilgerran Castle.

CARDIGAN, JAMES THOMAS BRUDENELL, SEVENTH EARL OF (1797-1868), and Baron Brudenell in the peerage of England, lieutenant-general, was the eldest surviving son of the sixth earl, and was born at Hambledon in Hampshire, October 16, 1797. He studied for several terms at Christ Church, Oxford; and in 1818 entered Parliament as member for the borough of Marlborough under the patronage of Lord Ailesbury. He entered the army in 1824 as cornet in the 8th Hussars, and was promoted in 1832 to be lieutenant-colonel in the 15th Hussars. With this regiment he made himself one of the most unpopular of commanding officers. He gave the reins to his natural overbearing and quarrelsome temper, treating his men with excessive rigour and indulging in unscrupulous licentiousness. Within two years he held 105 courts-martial, and made more than 700 arrests, although the actual strength of his regiment was only 350 men. In consequence of one of his numerous personal quarrels, he left the regiment in 1834; but two years later, at the urgent entreaty of his father, he was reinstated in the army, and appointed to the command of the 11th Hussars. He played the same part as before, and was censured for it; but he was allowed to retain his post, and the discipline and equipment of his regiment, in which he took great pride, received high commendation from the duke of Wellington. He succeeded to the peerage on the death of his father in August 1837. In September 1840 Lord Cardigan fought a duel, on Wimbledon Common, with Captain Tuckett, an officer of his regiment. The latter was wounded, and Lord Cardigan was tried before the House of Lords on a charge of feloniously shooting his adversary. But the trial was a mere sham, and on a trivial technical ground he was acquitted. In 1854, at the outbreak of the Crimean War, the earl of Cardigan was appointed to the command of the light cavalry brigade, with the rank of major-general, and he spent a very large sum in the purchase of horses and on the equipment of his regiment. He took a prominent part in the early actions of the campaign, and displayed throughout the greatest personal courage and the greatest recklessness in exposing his men. The feat which made his name famous was the charge of his brigade, numbering 600 men, on a body of Russian heavy cavalry 3600 in number at the battle of Balaklava (October 25, 1854). He forced his way through the enemy, but half his men and horses were left dead on the field. The charge, celebrated by Tennyson in his well-known lyric, has been the subject of much controversy,—some critics having an eye

only to the splendid daring and unquestioning obedience to orders, and others seeing only a foolhardy and unjustifiable throwing away of valuable lives. At the close of the war the earl was created K.C.B., and was appointed inspector-general of cavalry, and this post he held till 1860. In 1859 he was promoted colonel of the 5th Dragoon Guards, but was transferred in the following year to the command of his former regiment, the 11th Hussars. He attained the rank of lieutenant-general in 1861. He was twice married, in 1826 and in 1858, but had no children. On his death, which took place at Deene Park, Northamptonshire, on the 28th of March 1865, the titles passed to his relative, the marquis of Ailesbury.

CARDINAL, the name of the highest dignity in the Roman Catholic hierarchy. Very varying statements are found in the ecclesiastical historians respecting the origin of the name, the period at which it was first used, and the persons to whom it was applied in the earliest time of its use. This uncertainty is easily explained by the fact that both the thing and the name were at no time appointed and created, but grew up by successive and mainly abusive encroachments legitimized by usage, and from time to time more formally by Papal briefs and bulls. There can be little doubt that the word was originally applied to priests in the same sense in which it was and is applied to other things, as synonymous with "principal," that on which a thing hinges (*cardo*, a hinge).¹ The other ideas which have been put forward,—as that the priests so termed attended the pontiff when celebrating mass, standing at the corners (*cardines*) of the altar, that cardinal priests were those refugees from persecution who were received and "incardinated" into the clerical body of churches more happily circumstanced, and some others—maybe deemed the fanciful inventions of later writers in search of originality. What priests those were, who in fact or by privilege used this title in the earliest ages of the church, is a much larger and more debatable question, on which scores of volumes have been written. If, however, a guide is to be chosen, no safer can be found than Bingham,² who says, when pointing out that archpresbyters were by no means the same thing as cardinal presbyters, that the use of the term cardinal cannot be found in any genuine writer before the time of Gregory the Great (+ 604). For, says he, the Roman Council, on which alone Bellarmine relies to prove the word to have had a greater antiquity, is a mere figment. For the authorities for an earlier use of the term, such as they are, the reader may consult Gaetano Moroni's *Dizionario* at the word Cardinal. As regards the term "genuine" in Bingham's statement, it may be mentioned that both Baronius and Bellarmine regard the council said to have been held at Rome by Sylvester I. in 324 as genuine. Van Espen, on the other hand, considers it to be apocryphal. Further, in alluding to the origin of the name, Bingham notices the opinion of Bellarmine that the word was first applied to certain principal churches, and remarks that others have supposed that those among the priests in populous cities who were chosen from among the rest to be a council for the bishop were first called cardinals. And Stillingfleet³ says,—“When afterwards

these titles⁴ were much increased, those presbyters that were placed in the ancient titles, which were the chief among them, were called *Cardinales Presbyteri*, which were looked on as the chief of the clergy, and therefore were the chief members of the council of presbyters to the bishop.” Stillingfleet appears, however, to have been thinking exclusively of Rome. Various other churches in France, Italy, Germany, and Spain—as Bourges, Metz, Ravenna, Fermo, Salerno, Naples, Cologne, Compostella, &c.,—claimed the title of cardinal for their canons as by privilege, in most cases probably usurped and not granted. But the name appears gradually to have been understood to appertain only to those whom the pope specially created cardinals. And at last, in 1567, Pope Pius V. definitively decreed that none should assume the title of cardinal save those created such by the Roman pontiff, and the word from that time to this has been exclusively so applied.

If the origin and early use of the term cardinal is obscure, Sacred college the institution of a collegiate body consisting of cardinals⁵ and of none other is yet more so. There seem to be traces of such a conception in the life of Leo III. (+ 816) written by Anastasius the librarian. And Moroni cites many passages from various authors and documents between the above date and 1100, with a view of showing that, at all events, by the end of that time the body of cardinals was recognized as a collegiate corporation. But his citations seem to prove rather the reverse. Nor do we reach solid ground in this respect till we come to the bull “*Postquam*”⁵ of Sixtus V. (3d December 1585) which finally regulates the composition of the *Sacro Collegio*. By this instrument seventy is fixed as the maximum number of the sacred college “after the example of the seventy elders appointed by God as counsellors of Moses.” Nor has the number ever been exceeded since that time, though it is expressly laid down by the authorities on the subject, that no canonical disability exists to prevent the pope from exceeding that number should he see fit to do so. By the same bull “*Postquam*,” it is also provided that the seventy of the Sacred College should consist of six cardinal bishops, fifty cardinal priests, and fourteen cardinal deacons. The six cardinal bishops are the bishops of the sees lying immediately around Rome. The fifty cardinal priests take their “titles” from the principal churches in Rome, but are many of them bishops or archbishops of distant sees, and four must be by regulation members (usually the “generals”) of the monastic orders. The fourteen deacons take their titles from the “*deaconries*” established in the earliest ages of the Church for the assistance and protection of the widows and orphans of the faithful. It may be added here that Sixtus V., by the above-mentioned bull, decrees that if any person created a cardinal be not in deacon’s orders, he must receive them within the year. But “dispensations,” by virtue of which the dignity has been held for many years by men not even in deacons’ orders, have been common. If any cardinal should be in such a position at the time of the Pope’s death, he cannot enter conclave or participate in the election, unless by immediately qualifying himself by taking orders.

As the institution of cardinals was entirely arbitrary and an abuse, so, despite the shadow of an attempt to find or make a *raison d’être* for their existence in the assignment of such dignities to certain special sees and churches in and

¹ Pope Eugenius IV. writing in 1431, says. “As the door of a house turns upon its hinges, so the See of the Universal Apostolical Church rests and is supported on this institution.” Cave, in his article on Anastasius, the Roman librarian (*Scr. Eccl.*, vol. ii. p. 56, col. ii.) quotes the words of Pope Leo (about 848) respecting him—“*Presbyter cardinis nostri quem nos in titulo B. Marcelli Mart. atque Pont. ordinavimus*,” that is to say, continues Cave, that that Church was specially entrusted to him, that he might continually be busied in the care of it, *tamquam janua in cardine suo*.

³ *Irenicon*, pt. ii. ch. 6.

⁴ *I.e.*, those principal incumbencies which from the earliest ages of the Church of Rome had been so called,—a use of the word of which a curious survival may be traced in the common phrase “a title to holy orders.”

⁵ See, however, Cave, *Script. Eccl. Hist. Lit.*, vol. ii. p. 124, who says that about the middle of the 11th century they were enrolled (*asciti sunt*), in an Apostolic College.

around Rome, their connection with those churches very soon became purely nominal and formal; and everything connected with the selection of them depended wholly on the will of the pontiff. Not so, as will be seen presently, their prerogatives when they had been created. And the limits, which might be supposed to have bounded the field from which the Pope could select the objects of his favour, became constantly enlarged. A few only of the many instances of creations illustrating this fact which are on record can be here mentioned. Clement VI., in 1348, created his nephew Peter Roger cardinal when he was seventeen. Sixtus IV., in 1477, created John of Aragon cardinal at the age of fourteen, and at the same time his nephew Raffaele Riario who was seventeen. Innocent VIII. († 1492) created Giovanni de' Medici, afterwards Leo X., cardinal at fourteen, his eminence having been Apostolic Protonotary ever since he was seven! Ippolite d'Este had been an archbishop for the last nine years, when Alexander VI. created him cardinal in his seventeenth year. Alfred of Portugal was made cardinal by Leo X. when he was seven years old, on condition, however, that he should not assume the outward insignia of the dignity till he should be fourteen. The same pontiff made John of Lorraine cardinal at twenty, Alexander VI. having previously made him coadjutor of the bishop of Metz at four years old. Clement VII. made Odet di Coligny cardinal at twelve. Paul III. Farnese († 1549), created his nephew Alexander Farnese cardinal at fourteen; his grandson Guido Ascanio Sforza, the son of his daughter Costanza, at sixteen; his cousin Niccolò Gaetani at twelve; his relative Giulio Feltrino della Rovere, at eleven; and a second grandson, Ranuccio Farnese, at fifteen, having made him archbishop of Naples the year before. Paul also created Charles of Lorraine, brother of Mary Queen of Scots, cardinal at twenty-two, although he had a brother in the Sacred College at the time, which is contrary to the constitutions and the decree of one of the Pope's predecessors. But this is only one out of a hundred facts which demonstrate the futility of the attempt to bind the hands of one infallible autocrat by the rules enacted by his predecessors. Sixtus V. († 1590), a great reformer of abuses, made his nephew Alexander Peretti cardinal at fourteen. Paul V. († 1621) created Maurice of Savoy cardinal at fourteen, Carlo de' Medici at nineteen, and Ferdinand of Austria at ten. Clement XII. († 1740) made Luigi di Borbone archbishop of Toledo and cardinal at the age of eight. And, lastly, Pius VII. († 1823) created a second Luigi di Borbone, the son of the above-mentioned archbishop of Toledo, cardinal at twenty-three. The list of such creations might be much extended. Previously to the publication of the bull "Postquam" by Sixtus V. the number of the Sacred College was extremely variable. John XXII., requested in 1331 to make two French cardinals, replied that there were only twenty cardinals' hats, that seventeen of these were already French, and that he could, therefore, only make one more. At the death of Clement VI. (1352) the cardinals determined that their number should not exceed twenty. Urban VI. († 1389) created a great number; and we find the college making representations to Pius II. († 1464) to the effect that the dignity of the purple was diminished by such excess. Sixtus IV. († 1484), however, multiplied the number of his creations to an unexampled extent; and Alexander VI. († 1503) exceeded him. Leo X. created thirty-one cardinals at one batch, leaving at his death sixty-five, a number unprecedented up to that time. Paul III., however, created seventy-one. But Paul IV. († 1559) issued the bull called "Compactum," by which it was decreed that the number of cardinals should never exceed forty. His immediate successor, however, Pius IV. († 1565) raised

the number to forty-six. In 1590 came the final settlement at seventy by Sixtus V., as has been said.

Many volumes have been written on the different forms used by the popes in the creation of cardinals in different ages, and many more still larger treatises *ex professo* on the strictly ecclesiastical, as well as what may be more properly called the social, portions of the accustomed ceremonial. But it must suffice here to characterize very generally the differences which have prevailed from age to age in the first respect, and to say but a few words on the second head.

The general tendency of the changes which have taken place in the methods used for the creation of cardinals may be very shortly stated. They have been such as indicate the steadily increasing absolutism of the pontiffs. A proclamation to the congregation including an invitation to any person to state any ground of objection known to him soon gave place to a real consultation of the college by the Pope, and a real assent on the part of the cardinals to the proposed new nominations, which in its turn dwindled off at a very early period to a mere form of asking and receiving consent. In the earlier centuries the creations almost always took place on the first Wednesday of the *Quattro Tempora*,¹ and generally in the Basilica of Santa Maria Maggiore. There, after the *Introit* and collect of the Mass had been said, a reader ascended the pulpit and proclaimed the intended creation of such and such persons, ending with an invitation precisely similar to that used in our churches in the publication of banns of marriage, and a real inquiry followed the statement of any objector. At a later period the Pope asked of the cardinals assembled in secret consistory whether in their opinion there should be a creation of cardinals, and of how many? And a deputation was sent to the residence of any cardinals who might be ill to bring back their replies to the same questions. Then, satisfactory answers having been obtained from at least the majority, the Pope said "*Portetur nuda cathedra.*" The chair was brought, and placed at his right hand. Thereupon all the cardinals rose, and stood ranged against the wall at a distance out of earshot of the Papal throne. The dean of the Sacred College placed himself in the empty chair, and the Pope told him in a low voice whom he purposed to create, adding "*Quid vobis videtur?*" One by one all present were similarly interrogated, and then the Pope said aloud, "*Deo gratias habemus de personis creandis concordiam omnium fratrum,*" or "*quasi omnium,*" or "*majoris partis,*" as the case might be. And then the pontiff at once proclaimed the new dignitaries:—"*Auctoritate Dei Omnipotentis, Sanctorum Apostolorum Petri et Pauli, et nostrum creamus Sanctæ Romanæ Ecclesiæ Cardinales Presbyteros quidem . . . N. N. . . Diaconos vero . . . N. N. . . cum dispensationibus, derogationibus, et clausulis necessariis et opportunis.*" He then thrice made the sign of the cross, saying as he did so, "*In nomine Patris, &c., Amen,*" and the consistory was at an end.

In later times the proclamation having been made in consistory by the simple announcement, "*Habemus fratres*" so and so, the act of conferring the dignity with its insignia on the new recipients was performed at the Papal palace, and was accompanied by a mass of minutely ordered ceremonial which rendered it one of the most pompous and gorgeous scenic performances of the Roman Church and court. It would need many pages to describe the form and order of the ceremony, the intricacies of which no one was ever expected to remember or understand save the professional masters of the ceremonies, whose business it is to have mastered the science. And a description of it

¹ The *Quattro Tempora* were the fasts with which each quarter of the year commenced.

would serve no purpose, save that of causing amazement at the overgrown mass of frivolity which the constant tendency to extinguish significance under heaps of material forms and show, has led the old men who compose the Roman court to accumulate.

The social portion, as it may be called, of the ceremonial attendant on the creation of a cardinal, in which the city and all the inhabitants are concerned, is as pompous, and as much regulated by a whole code of traditional uses and customs, as the more purely ecclesiastical part of the business. The making of presents and payment of fees to persons of all sorts of conditions, from the high and reverend officials of the Curia to the cardinal's lackeys, makes a great part of it. And the amount of all these payments is minutely regulated. Great illuminations¹ take place in the city, and especially on the façade of the new dignitary's palace. Bands of music parade the city, and are specially stationed before the residences of the foreign ministers. The new cardinal opens his palace for a great full-dress reception, where all who have a decent coat, and specially all strangers, are welcomed. These are great and noted occasions for the display of the diamonds and toilettes of the Roman patrician ladies.

Cardinals
in Petto.

Before quitting the subject of the method of creating cardinals, the custom of reserving cardinals "*in Pectore*" must be briefly noticed. Various causes occasionally arose to lead a pontiff to deem it undesirable to declare to the world the person whom it was his purpose to create a cardinal. Martin V. († 1431) was the first who thus secretly created cardinals. But the practice then and subsequently differed essentially from that which the ever-increasing despotism of the popes brought it to under Paul III. and thenceforward. Martin and his successors, till Paul III. took the members of the college into their confidence, only strictly enjoining them not to divulge the fact that such and such persons were in fact cardinals. He died leaving four cardinals thus unpublished, having taken the oaths of the other cardinals that they would in case of his death recognize them. Notwithstanding their oaths, however, they refused when the Pope died to do so. And the popes have never been able to secure the admission to the college of those whose creation has been left by their deaths in this inchoate state. Sometimes the college has recognized them, and admitted them to the conclave; sometimes the succeeding Pope has re-created them out of respect for the wishes of his predecessor. Sometimes they have altogether lost the promotion intended for them. The change which Paul III. introduced consisted in confining the secret of the unpublished nominations to his own breast, keeping it "*in pectore*." His practice was, and that of his successors has been, to add to the form of proclamation in consistory, "*Alios duos (or more or less) in pectore reservamus arbitrio nostro quodcumque declarandos.*"

Shutting
and open-
ing of the
new Car-
dinal's
mouth.

Before quitting the subject of ceremonial, a word or two may be said of the singular practice of closing and subsequently opening the mouth of a newly created cardinal. Like almost everything else connected with the subject this form had once a real significance, but has become a mere meaningless formality. Some reasonable time was originally allowed to elapse before the pontiff in one consistory formally pronounced the month to be opened which he had declared to be closed in a previous consistory. Now the form of opening is pronounced within a few minutes of the form of closing. As may be readily understood the cardinal whose mouth was closed could not speak or vote in any assembly of the cardinals, but only

hear. When it has occurred that a cardinal has been left at the death of a Pope with closed mouth, the college have usually empowered one of their number to open the mouth of the cardinal so circumstanced. But it is a great mistake to suppose, as many have imagined, that a cardinal, whose mouth remained closed, was ineligible to the Papal throne. For not only any such cardinal, but any person whatever, clerk or lay, not being an avowed heretic, and not labouring under any canonical impediment to holy orders, is perfectly eligible as pope.

The chief of the insignia of a cardinal's dignity is the ^{Insignia} scarlet hat,—the original significance of which was, we are ^{and titles} told, to remind the wearer that he was to be at all times ready to shed his blood in martyrdom for the faith. At an early period it became, and has since continued to be, a huge unwearable construction of silk and hanging tassels, such as may be seen suspended from the roofs of cathedrals over the tombs of cardinals. So much is the hat the main mark of a cardinal's dignity, that "to receive the hat" is in common parlance equivalent to being made a cardinal. The canonical vestments of a cardinal are scarlet,² and in the city and in their homes the hems and such like of their coats, and also their stockings, are of the same colour,—in Italian parlance "purple." Hence, "to aspire to the purple," "to receive the purple," is also equivalent to being a candidate for or being made a cardinal. Their Eminences also wear a scarlet "*beretta*," a four-cornered cap of the shape well known in pictures and engravings, and a scarlet "*berettina*," or skull-cap. Until the time of Urban VIII. the cardinals were styled "*Illustrissimi*;" but that pope decreed that they should for the future be called "*Eminentissimi*," and addressed as "*your Eminence*."

It remains to add a few words on the privilege of a ^{Cardinal} cardinal as an elector of the pontiff; and though the ^{as Papal} subject is a large one, a very few words will suffice, because ^{electors} the treatment of it falls more properly and conveniently under other headings. In perfect consistency with every other portion of the history of the institution, the right and privilege of the cardinals to elect the Pope is an abuse, and has been attained by a long series of encroachments which have gradually eliminated the originally democratic constitution of the Church. The popes were at first chosen by the whole body of the faithful, then by the whole body of the clergy; then by the cardinals with the consent of the clergy, and, ultimately, absolutely and exclusively by the cardinals. That the mode of election has passed through these phases is certain; but the chronological details of the changes are extremely obscure. The methods pursued in the election belong to another place. And this article may be concluded by a statement of the fact, often misapprehended, that the right of a cardinal to enter conclave with his brethren and vote for the new Pope is indefeasible; and he is not to be deprived of it by any declaration of the late Pope or deposition by him, or by any amount of unworthiness, however patent. Cases are on record in which popes have sought by every means in their power to prevent certain cardinals from taking part in the election that would follow their death, and some in which monstrous crimes have rendered such exclusion reasonable and right in every point of view. But in every such case the college has overruled the provisions of the deceased pontiff, and admitted the acknowledged member of their body to take part in the election. (T. A. T.)

CARDONA (perhaps the ancient *Udura*), a fortified town of Spain, in the province of Catalonia, about 55 miles N.W. of Barcelona, in 41° 57' N. lat. and 1° 37' E. long. It occupies the summit of a hill near the banks of the

¹ It is to be understood that all this applies to the state of things before the Italian Government took possession of Rome. The Church now considers herself to be under eclipse, and all exterior pomp and magnificence are suppressed.

² Save in the case of members of the monastic orders, whose dress, similar in form to the others, is in colour that enjoined by their special rule.

Cardonera, a branch of the Llobregat, and from the strength of its position has been able to bid defiance to repeated attacks. Besides its citadel and ramparts, it possesses the ruins of the palace of Ramon Folch, the church of San Vicente, and the church in which the famous Catalonian saint Ramon Nonato expired. It is still more celebrated, however, for the extensive deposit of rock salt in its vicinity, which forms a mountain mass about 500 feet high in the head of a valley, covered by a thick bed of a reddish brown clay, and apparently resting on a yellowish grey sandstone. The salt is generally more or less translucent, but large masses of it are quite transparent; and pieces cut from it are worked by artists in Cardona into images, crucifixes, and many articles of an ornamental kind. Population about 3000.

CARDS, PLAYING (χάρτης, paper, probably, as Chatto thinks, square paper), rectangular pieces of pasteboard, used at games. The invention of playing cards has been attributed to various nations. In the Chinese dictionary, *Ching-tse-tung* (1678), it is said that cards were invented in the reign of Senn-ho, 1120 A.D., for the amusement of his numerous concubines. There is a tradition that cards have existed in India from time immemorial, and that they were invented by the Brahmans. A pack of cards, said to be a thousand years old, is preserved in the museum of the Royal Asiatic Society; but modern critics are of opinion that these cards are of recent date. The invention of cards has also been assigned to the Egyptians, but apparently on no better authority than the belief that the representations on tarots may be so interpreted as to connect them with Egyptian philosophy. To the Arabs, Germans, Spaniards, and French have also been ascribed the invention of cards, but on grounds of varying feebleness.

There are numerous singular resemblances between the ancient game of chess (*chaturanga*, the four *angas* or members of an army) and cards (see "Essay on the Indian Game of Chess," by Sir William Jones, *Asiatic Researches*, vol. ii.), from which it has been conjectured, with some show of reason, that cards were suggested by chess. The presumption, then, is in favour of the Asiatic origin of cards.

The time and manner of the introduction of cards into Europe are also moot points. The 38th canon of the council of Worcester (1240) is often quoted as evidence of cards having been known in England in the middle of the 13th century; but the games "de rege et regina" there mentioned were a kind of mumming exhibition (Strutt says chess). No queen is found in the earliest European cards.

In the wardrobe accounts of Edward I. (1278), Walter Stourton is paid 8s. 5d. "ad opus regis ad ludendum ad quatuor reges." This passage has been translated to mean cards; but as chess was known in the East by a term signifying the four kings (*chaturaji*), it is now believed that this entry relates to chess. If cards were known in Europe in 1278, it is very remarkable that Petrarch, in his dialogue which treats of gaming, never mentions them; and that though Boccaccio and Chaucer and contemporary writers notice various games, there is not a single passage in any one of them that can be fairly construed to refer to cards. Passages are quoted from various works, of or relative to this period, but modern research leads to the belief that in every instance the word rendered "cards" has either been mistranslated or interpolated.

The earliest unquestionable mention of a distinct series of playing cards is the well-known entry of Charles or Charbot Poupart, treasurer of the household of Charles VI. of France, in his book of accounts for 1392 or 1393. It runs thus—"Donné à Jacquemin Gringonneur, peintre, pour trois jeux de cartes, à or et à diverses couleurs, ornés

de plusieurs devises, pour porter devers le Seigneur Roi, pour son ébatement, cinquante-six sols parisis." From this entry it has hastily been concluded that Jacquemin Gringonneur (it is not certain whether Gringonneur was the painter's surname, or only his designation as a maker of *grungons*) invented cards; but the payment is clearly for painting, not for inventing them.

The safe conclusion with regard to the introduction of cards is that, though they may possibly have been known to a few persons in Europe about the middle of the 14th century, they did not come into general use until the end of the century, and that whence they were brought has not yet been ascertained. But if the testimony of Covelluzzo can be relied on, cards were introduced into Italy from Arabia in the year 1379. Covelluzzo, who wrote in the 15th century, gives as his authority the chronicle of one of his ancestors. His words are—"Anno 1379, fu recato in Viterbo el gioco delle carte, che venne de Seracina, e chiamasi tra loro naib." (In the year 1379 was brought into Viterbo the game of cards, which comes from the country of the Saracens, and is with them called naib. See "*Istoria della Città di Viterbo*," Feliciano Bussi, Roma, 1743.)

Soon after the date of Poupart's entry, cards it would seem became common; for in an edict of the provost of Paris, 1397, working people are forbidden to play at tennis, bowls, dice, cards, or nine-pins on working days. From the omission of cards in an ordinance of Charles V. (1369), forbidding certain games, it may reasonably be concluded that cards became popular in France between 1369 and the end of the century.

It does not follow that because the earliest positive mention of a series of cards is French, they were not previously known in other parts of Europe. It seems more likely, if their Eastern origin is accepted, that they travelled quickly through Europe to France. Early in the 15th century, card-making had become a regular trade in Germany, whence cards were sent in small casks to other countries. Cards were also manufactured in Italy at least as early as 1425, and in England before 1463; for by an Act of Parliament of 3 Edw. IV. the importation of playing cards is forbidden, in consequence, it is said, of the complaints of manufacturers that importation obstructed their business. No cards of undoubted English manufacture have been discovered of so early a date; and there is reason to believe, notwithstanding the Act of Edward IV., that our chief supplies came from France or the Netherlands. In the reign of Elizabeth the importation of cards was a monopoly; but from the time of James I. most of the cards used in this country were of home manufacture. In the reign of James I. a duty was first levied on cards; since when they have always been taxed.

It has been much disputed whether the earliest cards were printed from wood blocks. This is a question of some importance, as, if answered in the affirmative, it would appear that the art of wood engraving, which led to that of printing, may have been developed through the demand for the multiplication of implements of play. The belief that the early card-makers or card-painters of Ulm, Nuremberg, and Augsburg, from about 1418-1450, were also wood-engravers, is founded on the assumption that the cards of that period were printed from wood-blocks. It is, however, clear that the earliest cards were executed by hand, like those designed for Charles VI. Many of the earliest woodcuts were coloured by means of a stencil, so it would seem that at the time wood-engraving was first introduced, the art of depicting and colouring figures by means of stencil plates was well known. There are no playing cards engraved on wood to which so early a date as 1423 (that of the earliest dated wood-en-

graving generally accepted) can be fairly assigned; and as at this period there were professional card-makers established in Germany, it is probable that wood-engraving was employed to produce cuts for sacred subjects before it was applied to cards, and that there were hand-painted and stencilled cards before there were wood-engravings of saints. The German *Briefmaler* or card-painter probably progressed into the wood-engraver; but there is no proof that the earliest wood-engravers were the card-makers.

It is undecided whether the earliest cards were of the kind now common, called *numeral* cards, or whether they were *tarocchi* or *tarots*, which are still used in some parts of France, Germany, and Italy, but the probability is that the tarots were the earlier. A pack of tarots consists of seventy-eight cards, four suits of numeral cards and twenty-two emblematic cards, called *atutti* or *atouts*. Each suit consists of fourteen cards, ten of which are the pip cards, and four court (or more properly *coat* cards), viz., king, queen, chevalier, and valet. The atouts are numbered from 1 to 21; the unnumbered card, called the *fou*, has no positive value, but augments that of the other atouts. (See *Académie des Jeux*, Corbet, Paris, 1814, for an account of the mode of playing tarocchino or tarots.)

The marks of the suits on the earliest cards (German) are hearts, bells, leaves, and acorns. No ace has been discovered corresponding to the earliest known pack, but other packs of about the same date have aces, and it seems unlikely that the suits commenced with the deuces.

Next in antiquity to the marks mentioned are swords, batons, cups, and money. These are the most common on Italian cards of the late 15th century, and are now used both in Italy and in Spain. French cards of the 16th century bear the marks now generally used in France and England, viz., cœur, trèfle, pique, and carreau.

The French trèfle, though so named from its resemblance to the trefoil leaf, was in all probability copied from the acorn; and the pique similarly from the leaf (grün) of the German suits, while its name is derived from the sword of the Italian suits. It is not derived from its resemblance to a pike head, as commonly supposed. In England the French marks are used, and are named— hearts, clubs (corresponding to trèfle, the French symbol being joined to the Italian name, bastoni), spades (corresponding to the French pique, but having the Italian name, spade [dissyl.]), and diamonds. This confusion of names and symbols is accounted for by Chatto thus—"If cards were actually known in Italy and Spain in the latter part of the 14th century, it is not unlikely that the game was introduced into this country by some of the English soldiers who had served, under the banners of Hawkwood and other free captains, in the wars of Italy and Spain. However this may be, it seems certain that the earliest cards commonly used in this country were of the same kind, with respect to the marks of the suits, as those used in Italy and Spain."

About the last quarter of the 15th century, packs with animals, flowers, and human figures, for marks of the suits, were engraved upon copper; and later, numerous variations appeared, dictated by the caprice of individual card-makers; but they never came into general use.

The court cards of the early packs were king, chevalier, and knave. The Italians were probably the first to substitute a queen for the chevalier, who in French cards is altogether superseded by the queen. The court cards of French packs received fanciful names, which varied from time to time.

E. S. Taylor, B.A., London, 1865; W. Hughes Willshire, M.D., *A Descriptive Catalogue of Playing and other Cards in the British Museum*, printed by order of the Trustees, London, 1876. (H. J.)

CARDUCCI, BARTOLOMEO (1560–1610), better known as CARDUCHO, the Spanish corruption of his Italian patronymic, was born in Florence, where he studied architecture and sculpture under Ammannati, and painting under Zuccherò. The latter master he accompanied to Madrid, where he painted the ceiling of the Escorial Library, assisting also in the production of the frescos that adorn the cloisters of that famous palace. He was a great favourite with Philip III. and lived and died in Spain, where most of his works are to be found. The most celebrated of them is a Descent from the Cross, in the church of San Felipe el Real, in Madrid.

CARDUCCI, or CARDUCHO, VINCENZO (1568–1638), was born in Florence, and was trained as a painter by his brother Bartolomeo, whom he followed to Madrid. He worked a great deal for Philip III. and Philip IV., and his best pictures are those he executed for the former monarch as decorations in the Pardo Gallery. Examples of him are preserved at Toledo, at Valladolid, at Segovia, and at several other Spanish cities. For many years he laboured in Madrid as a teacher of his art, and from his atelier issued Giovanni Ricci, Pedro Obregon, Vela, Collantes, and other distinguished representatives of the Spanish school during the 17th century. He was also author of a treatise, or dialogue, *De las Excelencias de la Pintura*, which was published in 1633.

CARDWELL, EDWARD (1787–1861), a learned divine and ecclesiastical historian, was born at Blackburn in Lancashire in 1787. He was educated at Brasenose College, Oxford, where, in 1809, he took his degree of B.A. as first class in classics and second class in mathematics, and became a fellow of his college. He took his master's degree in 1812. After being for several years engaged as tutor and lecturer he was appointed, in 1814, one of the examiners to the university. In 1826 he was chosen Camden Professor of Ancient History; and during his five years' professorship he published an edition of the *Ethics* of Aristotle with selected notes for the use of students, and a course of his lectures on *The Coinage of the Greeks and Romans*. In 1831 he took his degree of D.D., and was called to the post of principal of St Alban's Hall, which he held till his death. He published in 1837 a student's edition of the Greek Testament, with the text divided into paragraphs, and furnished with various readings and notes, and accompanied page for page by the English authorized version. In the same year appeared his edition of the Greek and Latin texts of the *History of the Jewish War*, by Josephus, with illustrative notes. But his most important labours were in the field of English Church History. He projected an extensive work, which was to embrace the entire synodical history of the church in England, and was to be founded on Wilkins's *Concilia*. Of this work he executed some portions only. The first published of these was *Documentary Annals of the Reformed Church of England from 1546 to 1716*, which appeared in 1839 and soon reached a second edition. It was followed by a *History of Conferences, &c., connected with the Revision of the Book of Common Prayer from 1550 to 1690* (1840), which reached a third edition within ten years. In 1848 appeared *Synodalia, a Collection of Articles*

of Religion, Canons, and Proceedings of Convocation from 1547 to 1717, completing the series for that period. Closely connected with these works in the *Reformatio Legum Ecclesiasticarum* (1850), which treats of the changes proposed and attempted in the direction of reform during the reigns of Henry VIII., Edward VI., and Elizabeth. As a supplement to the foregoing, Dr Cardwell published in 1854 a new edition of Bishop Gibson's *Synodus Anglicana*. Dr Cardwell, as one of the best men of business in the university, held various important posts, among which were those of delegate of the press, errand of the university galleries, manager of the Bible department of the press, and private secretary to successive chancellors of the university. He died at Oxford, 23d May, 1861.

CAREW, GEORGE (died about 1613), second son of Sir Wymond Carew of Antony, was educated at Oxford, entered the Inns of Court, and passed some years in Continental travel. At the recommendation of Queen Elizabeth, who conferred on him the honour of knighthood, he was appointed secretary to Sir Christopher Hatton, and afterwards, having been promoted to a mastership in chancery, was sent as ambassador to the king of Poland. In the reign of James he was employed in negotiating the treaty of union with Scotland, and for several years was ambassador to the Court of France. On his return he wrote a *Relation of the State of France*, with sketches of the leading persons at the court of Henry IV. It is written in the classical style of the Elizabethan age, and was appended by Dr Birch to his *Historical View of the Negotiations between the Courts of England, France, and Brussels, from 1592 to 1617*. Much of the information regarding Poland contained in De Thou's *History of His Own Times* was furnished by Carew.

CAREW, GEORGE (1557-1629), Earl of Totness, and Baron Carew of Clopton, Warwickshire, was born in 1557. After completing his studies at Oxford, he joined the army, and held an important command in the Irish wars against the Earl of Desmond and the rebels. He was successively appointed governor of Askeaton castle, lieutenant-general of artillery, and, after the successful expedition to Cadiz (1596), lord-president of Munster, treasurer to the army, and ultimately one of the lords judges of Ireland. When he entered on his duties, the whole country was in open rebellion; but by a prudent and vigorous policy, backed by his own intrepidity in the field, he soon reduced the rebels to submission. His greatest exploit was the capture of Dunboy castle, a success which disappointed the Spanish allies, and in reality put an end to the war. For his services in Ireland he was made governor of Guernsey, and was raised to the peerage. He was afterwards made privy-councillor to James I., and died at London in 1629. Carew wrote an account of the wars in Ireland in a book called *Hibernia Pacata*, published after his death; and made several collections for the history of Henry V., which were afterwards digested into Speed's *History of Great Britain*. Some of his letters have been printed by the Camden Society, 1860.

CAREW, RICHARD (1555-1620), author of the *Survey of Cornwall*, was born in 1555. At an early age he became a distinguished student of Christ Church, Oxford, and when only fourteen was chosen to dispute extemporaneously with Sir Philip Sidney, in presence of the earls of Leicester and Warwick and other noblemen. From Oxford he removed to the Middle Temple, where he spent three years, and then went abroad. On his return he was appointed sheriff of Cornwall, and published his *Survey of the county*, a work which enjoyed a high reputation, and has been several times reprinted. His other works are entitled—*The Examination of Men's Wits*, a translation

from the Italian, part of which is said to have been executed by his father; *The True and Ready Way to learn the Latin Tongue*, a tract included in Hartlib's book on the same subject; and *A Translation of the first Five Cantos of Tasso's Gerusalemme*. He died in 1620.

CAREW, THOMAS (1589-1639), an English poet, was born about the year 1589. He studied at Oxford, and on the completion of his course was made gentleman of the privy chamber to Charles I. At court he was highly esteemed for the vivacity of his wit and the elegance of his manners; and his poetical tastes gained him the friendship of Ben Jonson, Sir William Davenant, and other celebrated literary men. He wrote several sonnets, amorous pieces, and masques, which were set to music by Henry Lawes and other eminent masters. Most of his smaller pieces are distinguished by peculiar sweetness and gracefulness, by light gaiety, and by felicitous expression. They are generally occasional poems, *vers de société*, addressed to ladies, and are sometimes exquisite of their kind. His longest and best known work is a masque called *Cælum Britannicum*, performed by the king and several of the nobles at Whitehall on Shrove Tuesday, 1633. Parts in this masque were taken by Lord Brackley and his brother, who acted in the following year in Milton's *Comus*. The *Cælum* is founded on the *Spaccio della Bestia* of Bruno (*q.v.*), and is a work of very considerable poetic merit. Some of the introductory verses remind strongly of Milton. Carew died in the prime of life about the year 1639. The best edition of his works is that of W. C. Hazlitt.

CAREY, HENRY (died 1743), a humorous poet and musical composer, was an illegitimate son of George Savile, Marquis of Halifax, and was born towards the end of the 17th century. He studied music under Lennert, Roseingrave, and Geminiani, but never attained to excellence in the higher departments of composition. His ballads and songs, however, were exceedingly popular at the time. He wrote several dramatic pieces for Covent Garden theatre, among which may be mentioned a burlesque tragedy called *Chrononhotonthologos* (1734); an operetta called the *Honest Yorkshireman*; two interludes, called *Nancy* and *Thomas and Sally*; and two burlesque operas, called *The Dragon of Wantley* (1737) and *Margery, or the Dragoness*. His songs were collected and published by himself in a work called *The Musical Century* (1740); and one of them, *Sally in our Alley*, the most graceful and natural of English lyrics, is yet popular. His dramatic works were published in 1743. Carey died at an advanced age the same year. It has often been said that he put an end to his own life, but the story had no good foundation.

CAREY, WILLIAM, D.D. (1761-1834), a Baptist missionary and Oriental scholar, was born at Paulerspury, Northamptonshire, in 1761. When a youth he worked with his father, who was a shoemaker; but before he was twenty years of age he joined the Baptists, and devoted a large portion of his time to village preaching. In 1787 he became pastor of a Baptist congregation in Leicester, and five years after was chosen by a Baptist missionary association to proceed to India as their missionary. On reaching Bengal, Carey and his companions lost all their property in the Hughli; but having received the charge of an indigo factory at Malda, he was soon able to prosecute the work of translating the Bible into Bengali. In 1799 he quitted Malda for Serampore, where he established a church, a school, and a printing press for the publication of the Scriptures and philological works. In 1801 Carey was appointed professor of Oriental languages in a college founded at Fort-William by the Marquis of Wellesley. From this time to his death he devoted himself to the preparation of numerous philological works,

consisting of grammars and dictionaries in the Mahratta, Sanskrit, Punjabi, Telinga, Bengali, and Bhotanta dialects. The Sanskrit dictionary was unfortunately destroyed by a fire which broke out in the printing establishment. From the Serampore press there issued no fewer than twenty-four different translations of the Scriptures, all edited by Dr Carey. He died in 1834.

CARGILL, DONALD (1610-1681), one of the leaders of the Covenanters, was born in 1610. He was educated at St Andrews, and afterwards attached himself to the Protesters. After his appointment to one of the churches in Glasgow, he made himself obnoxious to Government by his open resistance to their measures. Compelled to remain at a distance from his charge, he ventured back to celebrate the communion, and was arrested, but was liberated at the instance of some of his private friends. He was afterwards wounded at the battle of Bothwell Bridge, and fled to Holland, where he remained a few months. On his return he joined Richard Cameron in publishing the Sauquhar declaration, and boldly excommunicated the king and his officials. He was soon afterwards apprehended, and brought to Edinburgh, where he was beheaded on the 27th July 1681.

CARIA, a maritime province of Asia Minor, forming the south-western angle of the whole peninsula. It was bounded on the N. by Ionia and Lydia, on the W. and S. by the Ægean Sea, and on the E. by Lycia and a small part of Phrygia. Its limit to the north was the river Mæander, except near the mouth, where its cities of Miletus and Myus, with their territories, though on the south side of the Mæander, were included in Ionia. Its precise eastern limit is not so clearly fixed, but may be considered as an arbitrary line drawn from the Mæander a little east of Antiochia to the lofty mountain mass of Mount Cadmus (Baba-dagh), and thence along the great ridge of Salbacum (Boz-dagh) in a direction nearly south to the sea, where the promontory on the west of the Gulf of Macri constitutes the limit between it and Lycia. The coast-line of Caria is very peculiar, being wholly formed by a succession of great promontories advancing far out into the sea, and alternating with deep inlets or gulfs, running far up into the mainland. The largest and most important of these, known as the Ceramic Gulf or Gulf of Cos, extends inland for fully 70 miles, between the great mountain promontory terminating at Myndus on the north, and that which extends to Cnidus and the remarkable headland of Cape Krio on the south. North of this is found the deep bay called in ancient times the Gulf of Jasus (now known as the Gulf of Mendeliah), and beyond this again was the deeper inlet which formerly extended inland between Miletus and Priene, but of which the outer part has been entirely filled up by the alluvial deposits of the Mæander, while the innermost arm, called in ancient times the Latmic Gulf, is thus converted into a lake. South of Cape Krio again is the gulf known as the Gulf of Doris, with several minor arms and subordinate inlets, bounded on the south by a mountainous and rugged promontory called by the ancients Cynossema (now Cape Alupo) and erroneously regarded by them as forming the S.W. angle of Asia Minor. Between this headland and the frontier of Lycia is the deep and sheltered bay of Marmarice, noted in modern times as one of the finest harbours in the Mediterranean.

Almost the whole of Caria has more or less of a mountain character. The two great mountain masses of Cadmus (Baba-dagh) and Salbacum (Boz-dagh), which are in fact portions of the great chain of Taurus (see ASIA MINOR), form as it were the nucleus to which the whole physical framework of the country is attached. From these lofty ranges there extends a broad table-land in many parts

retaining a height of more than 3000 feet, while it sends down offshoots or arms of a rugged and mountainous character, on the north towards the valley of the Mæander, and on the west towards the Ægean. None of these ranges, however, attain a height of more than 4000 feet, with the exception of Mount Latmus, of which the highest summit, now known as Bash Parinak, rises to about 4500 feet.

This deeply indented coast is accompanied, as in most similar cases, by numerous islands, in some instances separated only by narrow straits from the mainland. Of these the most celebrated are the two great islands of Rhodes and Cos. But besides these there are Syme, Telos, Nisyros, Calymno, Leros, and Patmos, all of which have been inhabited, both in ancient and modern times, and some of which contain excellent harbours. Of these Nisyros alone is of volcanic origin; the others belong to the same limestone formation with the rocky headlands of the coast, of which they are in fact mere detached portions.

Like most of the provinces of Asia Minor, Caria was not merely a territorial division, but an ethnographical district, and the Carians are spoken of by all ancient writers as a distinct nation from their neighbours, the Lydians, Phrygians, and Lycians. But their origin and early history is very uncertain. According to a tradition generally adopted by the Greeks, they were originally called Leleges, and inhabited the islands of the Ægean, where they were subject to Minos, king of Crete, and formed the strength of his navy; and it was not till they were driven out of the islands by the Greeks that they settled on the mainland. It is much more probable that they were originally established on the continent, and from thence extended their power over the islands of the Ægean. That they were in very early times a powerful and warlike people, distinguished for their maritime skill and enterprise, may be considered as clearly proved, and was indeed a natural result of the peculiar configuration of their coasts. But at the period when we first obtain definite historical information concerning them, they had not only been expelled from the Cyclades and outlying islands of the Ægean, but had been driven back into the interior, from the coasts and islands of their own country, which had been occupied by Greeks of Dorian race, who had formed a Hexapolis or league of six cities, including three on the island of Rhodes, together with Cos, and Cnidus and Halicarnassus on the mainland. Besides these principal settlements the Greeks gradually colonized the whole of the coast region, which was hence sometimes designated by the name of Doris. But the Carians always maintained themselves in the interior of the country, and continued to be recognized as a distinct race, like the Lydians and Phrygians. Some writers indeed are inclined to believe that the people called Zeybeks or Nebeks, who occupy the inland mountain districts of Caria, and are distinguished from their neighbours by certain peculiarities, are lineal descendants of the ancient Carians.

Caria passed with little resistance under the Persian yoke, but afterwards joined in the Ionic revolt, and fought hard against the Persian generals before it again submitted. From this time till its conquest by Alexander, it continued to be subject to Persia, but under princes or rulers of its own, who resided at Halicarnassus, and were strongly imbued with the principles of Greek civilization (see HALICARNASSUS). The last of these native princes was named Pixodarns, and after his death the throne was usurped by a Persian named Orontobates, who offered a vigorous resistance to Alexander the Great. But after the capture of the capital, Halicarnassus, which sustained a long siege, the rest of Caria was quickly subdued. Alexander at first bestowed it upon Ada, a princess of the native dynasty, but it was soon incorporated with the Macedonian kingdom by his successors, and in common with the adjoining dis-

tracts of Asia Minor passed successively under the Syrian kings and those of Pergamus. It was united with the Roman empire after the extinction of the latter dynasty, and became a part of the Roman province of Asia. From this period it has no separate history of its own, and in common with the rest of Asia Minor became a part of the monarchy, first of the Seljukian and afterwards of the Ottoman Turks.

The principal cities of Caria in ancient times were Cnidus and Halicarnassus on the sea-coast, and Alabanda, Mylasa, and Stratonicea in the interior. At the present day, Budrum, which occupies the site of Halicarnassus, is still a place of some importance; while the two most considerable towns in the interior are Melassa (the ancient Mylasa) and Mughla, in the centre of the high inland plateau. The portions of the province adjoining the valley of the Mæander are fertile, and produce excellent figs and raisins; while the mountains near the sea-coast are for the most part clothed with forests, which render the scenery of the district among the most beautiful in Asia Minor. (E.H.B.)

CARIACO, or SAN FELIPE DE AUSTRIA, a town on the north coast of Venezuela, in the state of Cumana, situated at the east end of the gulf to which it gives its name, in 10° 27' 45" N. lat. and 63° 13' 21" W. long. The surrounding district produces cotton of the finest quality. Population about 7000.

CARIBBEAN SEA, that part of the Atlantic Ocean lying between the coasts of Central and South America and the islands of Cuba, Hayti, and Porto Rico, and the Leeward and Windward Islands.

CARIBBEE ISLANDS, in its more extended sense, is a name applied to the whole of the West Indies; but strictly, it only comprehends that cluster of islands stretching from Porto Rico to the coast of South America, and known as the Leeward and Windward Islands. See WEST INDIES.

CARIBS (in German *Karaiben*), a people of Red Indian race, which, at the time of the discovery of America by Columbus, was the most important along the northern coast of the southern continent, and in a number of the islands of what is still known as the Caribbean Sea. They were a strongly built, warlike, and aggressive people, and offered a pertinacious resistance to the advances of the Europeans, before whose arrival they had rendered themselves an object of terror to the other inhabitants of the region. They appear to have been addicted to cannibalism, and the very word cannibal is not improbably derived from a corruption of their name. From the islands they have for the most part disappeared, and their principal settlement is now in the republic of Honduras, where they form a very industrious and prosperous part of the population, while still retaining their original language and many of their peculiar customs. They are to be found principally in the district between the Paitook river and the Belize. Their immigration into Honduras dates only from about 1796, when the English, weary of the continual disturbances which they occasioned, transported them in a body from Dominica and St Vincent to the island of Roatan. In these islands they divided into two great tribes, known as the Red and the Black Caribs, of whom the former were the pure descendants of the ancient stock, while the latter were largely intermingled with Negro blood. To the same race probably belong the Galibi in French Guiana, the Yaoi in Venezuela, the Cumanagotto, the Pariagotto, and various other tribes of the continent.

CARICATURE (Italian *caricatura*, i.e., "*ritratto ridicolo*," from *caricare*, to load, to charge; French *charge*) may be defined as the art of applying the grotesque to the purposes of satire. The word "*caricatura*" was first used as English by Sir Thomas Browne (1605–1682), in his

Christian Morals, a posthumous work; it is next found, still in its Italian form, in No. 537 of the *Spectator*; it was adopted by Johnson in his Dictionary (1757), and only assumed its modern guise toward the end of the 18th century, when its use and comprehension became general.

Little that is not conjectural can be written concerning caricature among the ancients. Few traces of the comic are discoverable in Egyptian art,—three papyri only of a satirical tendency being known to exist, and these appearing to belong rather to the class of ithyphallic drolleries than to that of the ironical grotesque. Among the Greeks, though but few and dubious data are extant, it seems possible that caricature may not have been altogether unknown. Their taste for pictorial parody, indeed, has been sufficiently proved by plentiful discoveries of pottery painted with burlesque subjects. Aristotle, moreover, who disapproved of the grotesque in art, condemns in strong terms the pictures of a certain Pauson, who, alluded to by Aristophanes, and the subject of one of Lucian's anecdotes, is hailed by M. Champfleury as the *doyen* of caricaturists. That the grotesque in plastic art was practised by the Romans is evident from the curious frescoes unearthed at Pompeii and Herculaneum; from the mention in Pliny of certain painters celebrated for burlesque pictures; from the curious fantasies graven in gems and called Grylli; and from the number of ithyphallic caprices that have descended to modern times. But in spite of these evidences of Greek and Roman humour, in spite of the famous comic statuette of Caracalla, and of the more famous *graffito* of the Crucifixion, the caricaturists of the old world must be sought for, not among its painters and sculptors, but among its poets and dramatists. The comedies of Aristophanes and the epigrams of Martial were, to the Athens of Pericles and the Rome of Domitian, what the etchings of Gillray and the lithographs of Daumier were to the London of George III. and the Paris of the Citizen King.

During the long dusk of the Middle Ages a vast mass of material was accumulated for the study of the grotesque, but selection becomes even more difficult than with the scarce relics of antiquity. With the building of the cathedrals originated a new style of art; a strange mixture of memories of paganism and Christian imaginings was called into being for the adornment of those great strongholds of urban Catholicism, and in this the coarse and brutal materialism of the popular humour found its largest and freest expression. On missal-marge and sign-board, on stall and entablature, in gargoyle and initial, the grotesque displayed itself in an infinite variety of forms. Often obscene and horrible, often quaint and fantastic, it is difficult, if not absolutely impossible, to determine the import of this inextricable tangle of imagery. It has been pretended that it constituted an immense network of symbolism, in which the truths of the Church were set forth in forms intelligible to the popular mind. A second interpretation is that it is merely the result of the decorative artist's caprice. A third school has sought to discover in much of it the evidences of the struggle for supremacy between the secular clergy and the friars. Leaving all this on one side, however, until the application to archæology of the comparative method shall have made the matter somewhat clearer, it will be sufficient in this place to remark the prevalence of three great popular types, or figures, each of which may be credited with a satirical intention,—of Reynard the Fox, the hero of the famous mediæval romance; of the Devil, that peculiarly mediæval antithesis of God; and of Death, the sarcastic and irreverent skeleton. The popularity of the last is evidenced by the fact that no less than forty-three towns

in England, France, and Germany are enumerated as possessing sets of the Dance of Death, that grandiose all-levelling series of caprices in the contemplation of which the Middle Ages found so much consolation. It was reserved for Holbein (1493-1554), seizing the idea and resuming all that his contemporaries thought and felt on the subject, to produce, in his fifty-three magnificent etchings of the Danse Macabre, the first, and perhaps the greatest, set of satirical moralities known to the modern world.

It is in the tumult of the Renaissance, indeed, that caricature in its modern sense may be said to have been born. The great popular movements required some such vehicle of comment or censure; the perfection to which the arts of design were attaining supplied the means; the invention of printing ensured its dissemination. The earliest genuine piece of pictorial irony that has been discovered is a caricature (1499) relating to Louis XII. and his Italian War. But it was the Reformation that produced the first full crop of satirical ephemera, and the heads of Luther and Alexander VI. are therefore the direct ancestors of the masks that smirk and frown from the "cartoons" of *Punch* and the *Charivari*. Fairly started by Lucas Cranach, a friend of Luther, in his *Passionale of Christ and Antichrist* (1521), caricature was naturalized in France under the League, but only to pass into the hands of the Dutch, who supplied the rest of Europe with more or less satirical prints during the whole of the next century. A curious reaction is visible in the work of Peter Breughel (1510-1570) towards the grotesque *diablerie* and macaberesque morality of mediæval art, the last original and striking note of which is caught in the compositions of Jacques Callot (1593-1635), and, in a less degree, in those of his followers, Stefano della Bella (1610-1664) and Salvator Rosa (1615-1673). On the other hand, however, Callot, one of the greatest masters of the grotesque that ever lived, in certain of his *Caprices*, and in his two famous sets of prints, the *Misères de la guerre*, may be said to anticipate certain productions of Hogarth and Goya, and so to have founded the school of ironical *genre* which now-a-days does duty for caricature.

In England, during the 16th century, caricature can hardly be said to have existed at all,—a grotesque of Mary Stuart as a mermaid, a pen and ink sketch of which is yet to be seen in the Rolls Office, being the only example of it known. The Great Rebellion, however, acted as the Reformation had done in Germany, and Cavaliers and Roundheads caricatured each other freely. At this period satirical pictures usually did duty as the title pages of scurrilous pamphlets; but one instance is known of the employment during the war of a grotesque allegory as a banner, while the end of the commonwealth produced a satirical pack of playing cards, probably of Dutch origin. The Dutch, indeed, as already has been stated, were the great purveyors of pictorial satire at this time and during the early part of the next century. In England the wit of the victorious party was rather vocal than pictorial; in France the spirit of caricature was sternly repressed; and it was from Holland, bold in its republican freedom, and rich in painters and etchers, that issued the flood of prints and medals which illustrate, through emblematic allegories and elaborate symbolization, the principal political passages of both the former countries, from the Restoration (1660) to the South Sea Bubble (1720). The most distinguished of the Dutch artists was Romain de Hooghe (1638-1720), a follower of Callot, who, without any of the weird power of his master, possessed a certain skill in grouping and faculty of grotesque suggestiveness that made his point a most useful weapon to William of Orange during the long struggle with Louis XIV.

The 18th century, however, may be called emphatically the Age of Caricature. The spirit is evident in letters as in art; in the fierce grotesques of Swift, in the coarser *charges* of Smollett, in the keen ironies of Henry Fielding, in the Aristophanic tendency of Foote's farces, no less than in the masterly moralities of Hogarth and the truculent satires of Gillray. The first event that called forth caricatures in any number was the prosecution (1710) of Dr Sacheverell; most of these, however, were importations from Holland, and only in the excitement attendant on the South Sea Bubble, some ten years later, can the English school be said to have begun. Starting into active being with the ministry of Walpole (1721), it flourished under that statesman for some twenty years,—the "hieroglyphics," as its prints were named, graphically enough, often circulating on fans. It continued to increase in importance and audacity till the reign of Pitt (1757-1761), when its activity was somewhat abated. It rose, however, to a greater height than ever during the rule of Bute (1761-1763), and since that time its influence has extended without a single check. The artists whose combinations amused the public during this earlier period are, with few exceptions, but little known and not greatly esteemed. Among them were two amateurs, the countess of Burlington and General Townshend; Goupy, Boitard, and Liotard were Frenchmen; Vandergucht and Vanderbank were Dutchmen. But it must not be forgotten that this period witnessed also the rise of William Hogarth (1697-1764). As a political caricaturist this great man was not successful, save in a few isolated examples, as in the portraits of Wilkes and Churchill; but as a moralist and social satirist he has not yet been equalled. The publication, in 1732, of his *Modern Midnight Conversation* may be said to mark an epoch in the history of caricature. Mention must also be made of Paul Sandby (1725-1809), who was not a professional caricaturist, though he joined in the pictorial hue-and-cry against Hogarth and Lord Bute, and who is best remembered as the founder of the English school of water-colour; and of John Collet (1723-1788), said to have been a pupil of Hogarth, a kindly and industrious humourist, rarely venturing into the arena of politics. During the latter half of the century, however, political caricature began to be somewhat more skilfully handled than of old by James Sayer, a satirist in the pay of the younger Pitt, while social grotesques were pleasantly treated by Henry William Bunbury (1750-1811) and Woodward. These personalities, however, interesting as they are, are dwarfed into insignificance by the great figure of James Gillray (1757-1815), in whose hands political caricature became almost epic for grandeur of conception and far-reaching suggestiveness. It is to the works of this man of genius, indeed, and (in a less degree) to those of his contemporary, Thomas Rowlandson (1756-1827), an artist of great and varied powers, that historians must turn for the popular reflection of all the political notabilia of the end of the 18th and the beginning of the 19th centuries. England may be said to have been the chosen home of caricature during this period. In France, timid and futile under the Monarchy, it had assumed an immense importance under the Revolution, and a cloud of hideous pictorial libels was the result; but even the Revolution left no such notes through its own artists, though Fragonard (1732-1806) himself was of the number, as came from the graves of Gillray and Rowlandson. In Germany caricature did not exist. Only in Spain was there to be found an artist capable of entering into competition with the masters of the satirical grotesque of whom England could boast. The works of Francisco Goya y Lucientes (1746-1828) are described by Théophile Gautier as "a mixture of those of Rembrandt, Watteau, and the

"comical dreams of Rabelais," and Champfleury discovers analogies between him and Honoré Daumier, the greatest caricaturist of modern France.

The satirical grotesque of the 18th century had been characterized by a sort of grandiose brutality, by a certain vigorous obscenity, by a violence of expression and intention, that appear monstrous in these days of reserve and restraint, but that doubtless sorted well enough with the strong party feelings and fierce political passions of the age. After the downfall of Napoleon (1815), however, when strife was over and men were weary and satisfied, a change in matter and manner came over the caricature of the period. In connection with this change, the name of George Cruikshank (1792—), an artist who stretches hands on the one side towards Hogarth and Gillray, and on the other towards Leech and Tenniel, deserves honourable mention. Cruikshank's political caricatures, some of which were designed for the squibs of William Hone (1779-1842), are, comparatively speaking, uninteresting; his ambition was that of Hogarth—the production of "moral comedies." Much of his work, therefore, may be said to form a link in the chain of development through which has passed that ironical *genre* to which reference has already been made. In 1829, however, began to appear the famous series of lithographs, signed H.B., the work of John Doyle (1798-1868). These apt but feeble joenlarities are interesting other than politically; thin and weakly as they are, they inaugurate the style of political caricature which obtains, with but few and slight variations, at the present date. In France, meanwhile, with the farcical designs of Pigal and the realistic sketches of Henri Monnier, the admirable portrait-busts of Dantan the younger, and the fine military and low-life drolleries of Charlet (1792-1845) were appearing, and in these modern social caricature may be said to be fairly embodied. Up to this date, though journalism and caricature had sometimes joined hands (as in the case of the *Craftsman* and the *Anti-jacobin*, and particularly in *Les Révolutions de France et de Brabant* and *Les Actes des Apôtres*), the alliance had been but brief; it was reserved for Charles Philipon (1802-1862), who may be called the father of comic journalism, to make it lasting. *La Caricature*, founded by Philipon in 1831, and suppressed in 1833 after a brief but glorious career, was followed by *Le Charivari*, which is perhaps the most renowned of the innumerable enterprises of this extraordinary man. Among the artists he assembled round him, the highest place is held by Honoré Daumier, a draughtsman of great skill, and a caricaturist of immense vigour and audacity. Another of Philipon's band was Sulpice Paul Chevalier (1801-1866), better known as Gavarni, in whose hands modern social caricature, advanced by Cruikshank and Charlet, assumed its present guise, and became elegant. Mention must also be made of Grandville (1803-1847), the illustrator of *La Fontaine*, and a modern patron of the mediæval skeleton; of Traviès, the father of the famous hunchback "Mayeux;" and of Amedée de Noé, or "Cham," the wittiest and most ephemeral of pictorial satirists. In 1840, the pleasantries of "H.B." having come to an end, there was founded, in imitation of this enterprise of Philipon, a comic journal which, under the title of *Punch*, or the *London Charivari*, has since become famous all over the world. Its earliest illustrators were John Leech (1817-1864) and Richard Doyle, whose drawings were full of the richest grotesque humour. It is in the pages of *Punch* that the growth of modern pictorial pleasantry may best be traced. Of late years all the "cartoons," or political caricatures, have been the work of John Tenniel; they exhibit few of the features of caricature as it was understood by Gillray and Daumier; their object is not to excite hatred or contempt, but at

most to raise a smile. In social subjects, George Dumaerier, a fine draughtsman, though somewhat mannered and fond of a single type of face and figure, has carried the ironical *genre*, received by Leech from Gavarni and Charlet, to the highest point of elegance it has attained.

Of caricature, in the primitive sense of the word, there is but little. The fall of the French Empire and the subsequent siege of Paris, together with the reign of the Commune—a popular movement, though confined to a single city—produced a plentiful crop of genuine caricatures, remarkable both for bitterness and for ability. Among the few caricatures that now find favour may be mentioned the graceful and genial caprices of Sambourne, the clever portraits of "Gill," a Parisian artist, and especially the remarkable series of portraits published in London since 1862, in *Vanity Fair*, the work of Pellegrini, which are certainly the most remarkable of their kind that have appeared since the superb grotesques of Honoré Daumier.

See Grose, *Rules for Drawing Caricature, with an Essay on Comic Painting*, London, 1783, 8vo; Malcolm, *Historical Sketch of the Art of Caricaturing*, London, 1813, 4to; Wright, *History of Caricature and Grotesque in Literature and Art*, London, 1865; Jaime, *Musée de la Caricature*; Champfleury, *Histoire de la Caricature Antique*, Paris, 8vo; *Histoire de la Caricature Moderne*, Paris, 8vo; *Histoire de la Caricature au Moyen Age*, 8vo; *Histoire de la Caricature sous la République, la Restauration, et l'Empire*, Paris, 8vo.

CARIES, ulceration of bone, is the result of inflammation, and resembles in its chief characteristics ulceration in soft tissues, as skin and muscle. Situated in a tissue largely composed of inorganic material, it is chronic in its course, and cured with difficulty. The exciting cause is generally an injury. It is frequently associated with scrofula. The cancellated tissue of bone is specially liable; the short bones of the hand and foot, the articular extremities of the long bones, and the bones forming the vertebral column are its chief seats. It is preceded by the formation of matter, and when this escapes, either by natural processes or by the assistance of the surgeon, the diseased bone can be felt by the aid of a probe, passed through the sinus or channel which leads to the carious bone. This sinus does not heal until the disease heals or is removed. The treatment generally adopted consists in removing the diseased bone by gouging or by excision. If the primary abscess is opened and dressed antiseptically for a lengthened period, the ulcerated bone often heals without further operation. This method of treatment is most valuable in cases of caries of the vertebral column, in which it would be impossible to remove the disease by gouging or excision.

CARIGNANO, a town of northern Italy, in the Province of Turin, and about 20 miles south of that city, is situated on the left bank of the Po, here crossed by a wooden bridge. It is surrounded by old walls, and has a handsome church, built in 1766, according to the design of Alfieri, a communal college, and several convents. The population, numbering about 8000, is chiefly engaged in the spinning of silk and the manufacture of confectionery, the principal department in the latter industry being the preparation of the citron rind.

Carignano, known in the early part of the Middle Ages as Carinatum and Carginum, passed in 1418 into the hands of the counts of Savoy, who fortified it with rampart and ditch. In 1630 it was bestowed by Charles Emmanuel I. on his son Tommaso Francesco, who thus became known as prince of Carignano. The title continued in the possession of his family, until they were called to the throne in the person of Charles Albert. It was bestowed in 1834 on Eugene Emmanuel Joseph, who now holds the rank of admiral and commander-in-chief of the Italian National Guards.

CARIMATA ISLANDS, a group in the East Indian Archipelago, lying to the West of Borneo, between that island and Billiton, in the channel to which they give their

name. They are about sixty in number, but their united area is not more than 170 square miles. The most important are Great Carimata (with a peak rising to about 2000 feet), Panumbangan, the Pelapis Islands, Lissing, Bessi, Maledang, Surutu, and Pulu Lima. Their principal productions are edible nests, honey, wax, gutta percha, turtles, trepang, and shellfish. At one time the cluster formed a small independent principality; but it afterwards became subject to Matau, and it is now attached to Pontianak. Several of the islands are altogether uninhabited, and the whole population is very small. See Veth's *Woordenboek van Nederl. Indië*.

CARINI, a town in Sicily, in the province of Palermo, on a rivulet of the same name, 12 miles W.N.W. of Palermo. It is pleasantly situated on an elevation, and is a neat, clean town, with a Gothic castle. On the coast, about three miles distant, are ruins of the ancient *Hyccara*, which was chiefly famous as the birthplace of Lais. Population about 9500.

CARINOLA, a town of Italy, in the province of Terra di Lavoro, a district of Gaeta, in 41° 11' 16" N. lat. and 13° 58' 32" E. long. It was formerly the see of a bishop, and is believed to occupy the site of the Lombard city of Foro Claudio, which was founded in 1058. Its principal buildings are the cathedral, the convents, and the seminary. Population, 7640.

CARINTHIA (in German, *Kärnten* or *Kärnthen*), a duchy, and since 1849 a crown-land of Austria, is bounded on the E. by Styria, on the N. by Styria and Salzburg, on the W. by Tyrol, and on the S. by Italy, Görz, and Carniola. It has an area of 4006 English square miles, and the population in 1869 amounted to 336,400. The surface is for the most part mountainous, being occupied in the north by part of the Norian Alps, and in the south by those named the Carinthian Mountains, or the Karawanken. The principal river is the Drave, which flows from W. to E. through the length of the duchy, and receives in its course the waters of all the other streams, except the Fella, which reaches the Adriatic by junction with the Tagliamento. In its eastern half, the valley opens out into a considerable plain, which contains the important lakes of the Wörthersee and the Ossiachersee. According to official statistics, 337,246 acres of arable land were in cultivation in 1870; 280,581 acres were occupied by gardens and meadows, 593,040 by pasture, and 1,033,807 were under wood. In the same year there were in the duchy 22,979 horses, 232,791 head of cattle, 176,832 sheep, and 36,630 goats, while the bee-stocks amounted to 62,615. The mineral produce consisted of 145,940 tons of iron ore, 5,047 of lead ore, 71,264 of coal, 4,220 of zinc ore, and nearly 26 of graphite. The duchy is divided into the seven districts of Hermagor, Klagenfurt, Spittal, St Veit, Villach, Völkermarkt, and Wolfsberg,—the capital Klagenfurt forming an independent and eighth division. There are in all ten towns, twenty-eight market villages, and 2,911 hamlets,—the most populous places, besides the chief towns of the districts, being Bleiberg, Friesach, and Feldkirchen. With the exception of 19,000 Lutherans, the inhabitants are Roman Catholics; and more than two-thirds of them are of German race. The rest are of Slavonic origin, and for the most part occupy the districts conterminous with Carniola and Styria, though a considerable Slavonic enclave is situated in the heart of the German area between Malborget and Tarvis. German is used in 255 of the village schools, and Slavonic in 24, while both are employed in 70. The Carinthian diet consists, according to the law of 1861, of thirty-seven members, including, besides the bishop of Gurk, ten appointed by the landed proprietors, seven by the towns, fourteen by the rural communes, and three by the commercial authorities at Klagenfurt. Five members are sent to the imperial diet.

Carinthia is so called from the Carni, a Celtic people who have perhaps also left their name to the neighbouring district of Carniola; and in the time of Augustus it formed part of Noricum. After the fall of the Roman empire, it was the nucleus of the kingdom of Carantania, which was founded by Samo, a Frankish adventurer, but soon fell to pieces after his death. Under Charlemagne it constituted a margravate, which in 843 passed into the hands of Louis the German, whose grandson Arnulf was the first to bear the title of Duke of Carinthia. The duchy was held by various families during the 11th, 12th, and 13th centuries, and at length in 1335 was bestowed by Louis the Bavarian on the Dukes of Austria. It was divided into Upper or Western Carinthia and Lower or Eastern; of these the former fell to France in 1809, but was reconquered in 1813, and joined in 1814 to the kingdom of Illyria. See AUSTRIA, vol. iii.

CARIPE, or CARIBE, a town of Venezuela, in the state of Cumana, and about 40 miles from the city of that name, in 10° 10' 14" N. lat. and 28° 33' 54" W. long. It is the chief station of the mission to the Chayma Indians, and is famous for the extensive system of caves in the limestone rock in the neighbourhood, which have been described by Humboldt. These extend inwards a distance of 2800 feet, and have a height of 70 or 80 feet. They are frequented by a species of night hawk, which builds in the recesses of the rocks. The young are killed in great numbers for the sake of their oil. The population of the town and valley is estimated at 5000.

CARISBROOKE, a village in the Isle of Wight, about a mile S. of Newport, at the base of a steep conical hill crowned by the castle, to which its celebrity is principally due. It was at one time a considerable market-town, and under the independent lords of Wight it ranked as the capital of the island. The original fortress is supposed to have been built by the Saxons as early as the 6th century; and, indeed, according to the annals, it was besieged by Cerdic in 530. It was enlarged by William Fitzosborne, the first lord of Wight, in the 11th century, was captured by Stephen in 1136, and in the reign of Richard II. resisted an attack by the French. Further additions were made to it at different times, till, in the reign of Elizabeth, it reached its greatest dimensions, and comprised within its outer walls a space of 20 acres. The most interesting incident in its history is the captivity of Charles I., who took refuge with its governor, Colonel Hammond, in November 1647, but soon found his asylum converted into a prison. After his execution his two youngest children were confined in the castle, and the princess Elizabeth died there. The remains are still extensive and imposing, but the king's apartments are in ruins. Within the walls is a well 200 feet deep; and another in the centre of the keep is reputed to have been still deeper. Opposite the castle-hill are the remains of a Cistercian priory founded in the 11th century, and the parish church, which boasts of even greater antiquity. The population of the parish in 1871 was 8198.

CARISSIMI, GIACOMO, one of the most celebrated masters of the Italian, or, more accurately, the Roman school of music. Of his life almost nothing is known, and Fétis, who has made his biography a subject of special study, has been able to do little more than correct inaccurate or fictitious statements of previous writers. The only authenticated facts are the following. Carissimi was born about 1604, at Marino, near Rome, and received his first musical education at home. At the age of 20 he became chapel-master at Assisi, and in 1628 he obtained the same position at the church of St Apollinaris, belonging to the Collegium Germanicum in Rome, which he held till his death in 1674. He never seems to have left Italy, the rumour of his prolonged stay in Paris, mentioned by De Fresneux, being entirely unfounded. By his education he belonged to the old Roman school of music, but his compositions show little of the severe grandeur of the earlier masters. He marks indeed the turning-point from the traditions of the

Renaissance period to the incipient aspirations of modern music, and for that reason his name is representative in the history of art. The two great achievements generally ascribed to him are the further development of the recitative, lately introduced by Monteverde, and of infinite importance in the history of dramatic music, and the invention of the cantata, a smaller form of the oratorio, by which Carissimi superseded the madrigals formerly in use. He also may claim the merit of having given greater variety and interest to the instrumental accompaniments of vocal compositions. Carissimi's numerous compositions consist of masses, cantatas, motets, and oratorios. The complete collection of his works, formerly said to have existed in the musical archives of the church of St Apollinaris, has entirely disappeared. Several English musical scholars deserve honourable mention for having rescued Carissimi's works from oblivion. Dr Burney and Hawkins have published specimens of his compositions in their works on the history of music; and Dr Aldrich collected an almost complete set of his compositions, at present in the library of Christ Church, Oxford. The British Museum also possesses numerous valuable works by this great Italian master.

CARLETON, SIR DUDLEY (1573-1651), an English statesman, was born in Oxfordshire in 1573, and educated at Christ Church College, Oxford. He went in a diplomatic capacity to the Low Countries when King James resigned the cautionary towns to the States; and he was afterwards employed for twenty-nine years as ambassador to Venice, Savoy, and the United Provinces. Charles I. created him Viscount Dorchester, and appointed him one of his principal secretaries of state, an office which he held till his death in 1651. He published several works, consisting chiefly of speeches, letters, and other productions on political subjects. The most valuable appeared after his death, and consist of a selection of letters to and from Sir Dudley Carleton during his embassy to Holland, from January 1616 to December 1620, &c., 1757. A careful pedigree of the Carleton family will be found in the preface to *Chamberlaine's Letters*, Camden Society, 1861.

CARLETON, WILLIAM (1798-1869), a popular Irish novelist, was born at Prillisk, Clogher, in the county of Tyrone. His father was a peasant tenant, and young Carleton passed his early life among scenes precisely similar to those he afterwards delineated with so much power and truthfulness. His parents, though of humble rank, were highly endowed by nature. The father was remarkable for his extraordinary memory, which was well stored with anecdote and tale; the mother was noted throughout the district for the rich sweetness of her voice. Both possessed in a high degree those domestic virtues so frequently found among the humbler classes of the Irish people. The beautiful character of Honor, the miser's wife, in *Fardorougha*, is evidently sketched from the life by the loving hand of a son.

The education received by Carleton was of a very humble description. As his father removed from one small farm to another, he attended at various places the hedge-schools, which used to be a notable feature of Irish life. The admirable little picture of one of these schools in the *Traits and Stories* bears every mark of having been drawn from real experience. A smattering of some higher learning was picked up here and there as opportunity offered, and at the age of seventeen Carleton resolved to prosecute his education as a poor scholar. The resolution was not carried into effect; he remained at home, preparing to enter upon the training for the priesthood, and receiving the unbounded veneration of the neighbouring peasantry for his supposed wonderful learning. An amusing account of this phase of his existence is given in the little sketch *Denis O'Shaughnessy*. When about the age of

nineteen he undertook one of the religious pilgrimages then common in Ireland. His experiences as a pilgrim were such as at a later period made him resign for ever the thought of entering the church. His vacillating ideas as to a mode of life were determined in a definite direction by the reading of *Gil Blas*, which chance had thrown in his way. He resolved to cast himself boldly upon the world, and try what fortune had in store for him. He went to Killanny, and for six months acted as tutor in a neighbouring farmer's family. Soon tiring of this occupation, he set out for Dublin, and arrived in the metropolis with 2s. 9d. in his pocket. He began to contribute to the journals, and his paper "The Lough Derg Pilgrim," which was published in the *Christian Examiner*, excited great attention. In 1830 appeared the first series of *Traits and Stories of the Irish Peasantry*, which at once placed the author in the first rank of Irish novelists. A second series appeared in 1832, and was received with equal favour both in Ireland and in England. From that time till within a few years of his death Carleton's literary activity was incessant. The best of his many productions are *Fardorougha*, *the Miser*, perhaps on the whole the finest and most powerful of all his works; *The Tithe Proctor*; *Valentine McClutchy*; *The Black Prophet*; *The Emigrants of Ahadarra*. Some of his later writings, such as *The Squanders of Castle Squander*, were not so successful as the earlier tales. The author was not happy in describing the upper classes of Irish society, and overloaded his work with political or semi-political matter.

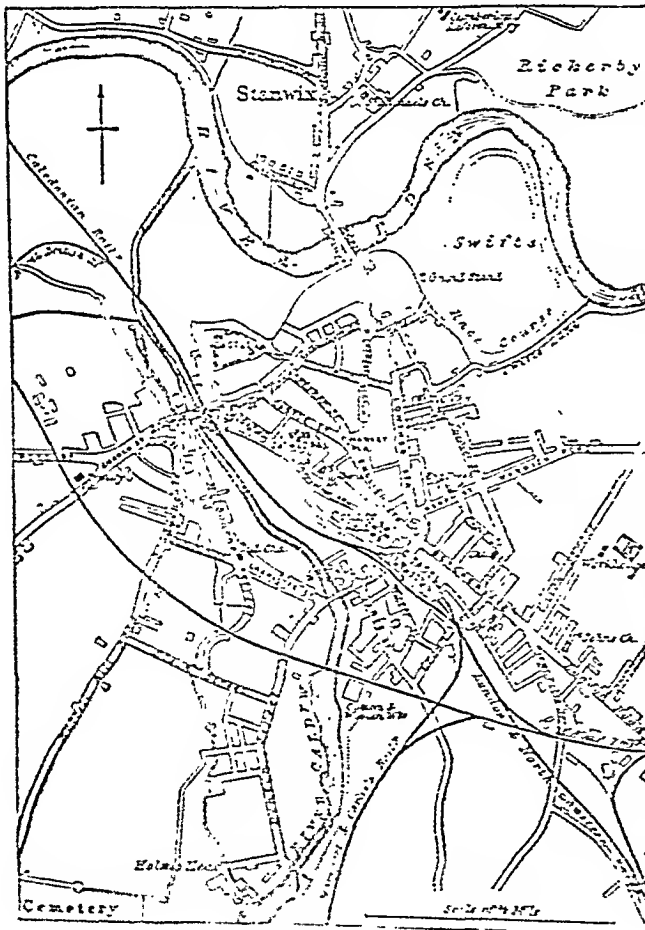

Carleton is *facile princeps* among Irish novelists, and it is to his pages that one must look for an adequate picture of the peculiar Irish character. His style is clear, graphic, and pleasing; the plots of his stories are generally slight but well constructed. In his pictures of peasant life he is unsurpassed; the lights and shades of Irish character, the buoyant humour and domestic virtues that under other conditions would lead their possessors to prosperity and happiness, and the fatal flaws that seem to render it impossible for Ireland ever to become capable of self-government, receive equal justice at his hands. He invariably writes from intimate acquaintance with the scenes described and from loving sympathy with the many good and noble elements in the Irish nature. He does not hesitate to point out the darker features of Irish life, nor to draw attention to the fatal system of education and priestly supremacy that did so much to produce them.

Carleton, after spending some years in America, settled in Dublin, where he died on the 30th January 1869. For many years before his death he had enjoyed a pension of £200 from the Crown.

CARLI, or CARLI-RUBBI, GIOVANNI RINALDO, COUNT OF, (1720-1795), a celebrated Italian writer on antiquities and economies, was born at Capo d'Istria, in 1720. He was early distinguished for the extent and variety of his acquirements, and at the age of twenty-four was appointed by the senate of Venice to the newly-established professorship of astronomy and navigation in the University of Padua, and intrusted with the superintendence of the Venetian marine. After filling these offices for seven years with great credit, he resigned them, in order to devote himself to the study of antiquities and political economy. His principal economic works are his *Delle Monete, e della Istituzione delle Zecche d'Italia*; his *Ragionamento sopra i Bilanci economici delle Nazioni* (1759), in which he maintained that what is termed the balance of trade between two nations is no criterion of the prosperity of either, since both may be gainers by their reciprocal transactions; and his *Sul libero Commercio dei Grani* (1771), in which he argues that free trade in corn is not always advisable. Count Carli's merits were appreciated by Leopold of

Tuscany, afterwards emperor, who, in 1765, placed him at the head of the council of public economy, and of the board of public instruction. In 1769 he became privy councillor, in 1771 president of the new council of finances. The duties of these offices he continued to discharge with ability for several years; but for some time before his death, which took place in February 1795, he was relieved from their toils,—retaining, however, their emoluments, as a reward for his important services. It was during the leisure thus afforded that he completed and published his very valuable *Antichità Italiane*, in which the literature and arts of his country are ably discussed. Besides the above, he published many works on antiquarian, economic, and other subjects, including *L'Uomo Libero*, in confutation of Rousseau's *Contract Social*; an attack upon the Abbé Tartarotti's assertion of the existence of magicians; *Observazione sulla musica antica e moderna*; and several poems.

CARLISLE, a parliamentary and municipal borough, the capital of Cumberland, 301 miles N.N.W. from London; 54° 54' N. lat., 2° 55' W. long. It is situated on an eminence enclosed by the three streams—the Eden, the Caldew, and the Petteril. The Eden, which is the principal river, is joined by the Petteril on the east side of the city; about a mile further west, as it flows through fertile holms, it is joined by the Caldew, and about six miles further on it falls into the Solway Firth. A handsome stone bridge, built in 1812-15, at a cost of £70,000, spans the Eden, midway between the mouths of the Petteril and the Caldew.

Plan of Carlisle.

All the three streams are unnavigable. In the Eden there is good salmon fishing. Before the Romans invaded Great Britain a Celtic town was erected on the site of Carlisle; and when the Romans came they occupied and improved it. Archaeologists consider it doubtful whether the Romans made it a military station to aid in the defence of their

newly-acquired colony against the incursions of the Picts; but Roman coins, pottery, inscribed tablets, and other remains have been found in such abundance that there can be no doubt Carlisle was, if not a military post, a town of considerable importance in those days. The great wall of Severus, extending from the Solway Firth to the German Ocean, crossed the River Eden at Carlisle; and remains of this great barrier may still be seen on the outskirts of the city. The Solway end of the wall, traces of which are still to be seen, was about twelve miles from Carlisle, at Bowness; and there was an important Roman camp, the Amboglana, of the *Notitia*, about fifteen miles eastward of the city, called Birdoswald, of which interesting remains are still in existence.

Carlisle was the *Luguvallum* of the Romans. This name was afterwards abbreviated to *Luell*, and with the prefix *Caer* (a city), became *Caer-Luelli*, and afterwards by easy transition, *Carloli* and *Carlisle*. After the departure of the Romans in the 5th century the Picts laid the city in ruins; but in the 7th century it was rebuilt by Egfrid, king of Northumberland. In 875 the town was attacked by the Danes, who burned the houses, pulled down the wall, and massacred the inhabitants. In this state of desolation it was left for 200 years, with no inhabitants but some few Celts who lodged themselves among the ruins. In 1092 William Rufus, impressed with the importance of Carlisle as a Border military station, ordered the town to be rebuilt and fortified, and left a garrison there. It was not, however, until after the capture of the town in the reign of Stephen, by David, king of Scots (who died within its walls in 1153), that the castle, the walls, and the citadel were completed.

After undergoing two sieges the town was surrendered to the English Crown in 1217. Edward I. held three parliaments in Carlisle. In 1298, after the battle of Falkirk, he marched to Carlisle; and nine years later it was while crossing Burgh Marsh, about four miles from that city, with his army, to quell the third revolt which had occurred in Scotland during his reign, that he sickened and died. A monument has been erected on the spot to commemorate the event. With his last breath he enjoined his son to prosecute the enterprise, and never desist until he had completed the subjugation of Scotland. The nobles hastened to Carlisle to pay homage to the new king, Edward II., to whom, however, the legacy of vengeance against the Scots proved but a "heritage of woe." In 1315, after the independence of Scotland had been won by the decisive battle of Bannockburn, Robert Bruce, following up his success by ravaging the north of England, besieged Carlisle Castle. There he met with determined resistance on the part of the garrison and the inhabitants, under Sir Andrew Harcla, governor. Bruce, who had his headquarters at the cathedral, made a general assault on all the gates of the town on the ninth day; but the citizens defied their position with such valour that the besiegers soon beat a retreat, having only killed two of the besieged. Sir Andrew Harcla was created earl of Carlisle and Lord Warden of the Marches for this gallant defence of the city; but he was afterwards found guilty of treason and executed at Harraby Hill. In 1345 the Scots burned Carlisle and Penrith. "They were very much annoyed," says Lysons, "by small forces collected by Bishop Kirkby and Sir Thomas Lacy. The bishop and Sir Robert Ogle had a sharp skirmish with the enemy; the prelate was unhorsed during the encounter, but having recovered his saddle continued to fight valiantly, and contrived greatly to win the victory." Nor was it only the "church militant" which did the state much service in those days. In one of the sieges the women of Carlisle helped in the defence of the city by pouring boiling water and rolling heavy stones from

the walls upon the heads of the beleaguering Scots below. In the 15th century Richard, duke of Gloucester, was governor of Carlisle Castle, and during his governorship extensive repairs were made in the old fortress, and in the course of time, during the reigns of Henry VIII. (who built the citadel) and Elizabeth, it was adapted to artillery. In 1568 Mary Queen of Scots, having fled from Lochleven, arrived in a fishing boat at Workington, a Cumberland seaport 32 miles from Carlisle, and was there met by the deputy-governor of Carlisle, and conducted to Carlisle Castle, where she was lodged nominally as a guest but actually as a prisoner. She remained there for two months. In the year 1596 a daring exploit was performed by Sir Walter Scott of Buccleuch. William Armstrong, a redoubtable Borderer, better known as "Kinnmont Willie," having been taken prisoner in disregard of a truce or understanding which facilitated his capture, the "Bold Buccleuch," with 200 followers, attacked Carlisle Castle, and rescued the prisoner, an achievement which gave dire offence to Queen Elizabeth.

During the civil wars Carlisle was harassed by frequent troubles; but the next event of importance occurred in 1644, when the city and castle were besieged by the Parliamentary forces under General Leslie for eight months. Sir Thomas Glenham, the commander-in-chief of the royal troops, was in charge of the garrison, who were reduced to great extremities before they surrendered on 25th June 1645. Their valiant resistance was recognized by the besiegers, who allowed them to march out "with their arms, flying colours, drums beating, matches lighted at both ends, bullets in their mouths, and twelve charges of powder a-piece." The Parliamentary army pulled down some important portions of the cathedral buildings, and out of the materials erected a guard-house in the market-place. In 1648 Sir Philip Musgrave and Sir Thomas Glenham effected the capture of Carlisle by surprise; but in October it was again surrendered to Cromwell, according to treaty. At this time great distress prevailed in the county, considerable families having barely the necessaries of life, while numbers of the poor died on the highways.

In the Scottish rebellion of 1745 Carlisle again figured in history. The Pretender, Prince Charles Edward, laid siege to it, the three divisions of the army with which he marched from Edinburgh having converged at the city. The castle was at that time garrisoned by only two companies of invalids and some disaffected militia, and Colonel Durand, who was in command, found it necessary, with great reluctance, to surrender. "Bonnie Prince Charlie" rode into the town on a white charger, with a hundred Highland pipers playing a triumphal march in front, and made a house in English Street, which is still in existence, his headquarters. But in December of the same year the duke of Cumberland arrived and bombarded the castle, which his grace described as "an old hencoop, which he would speedily bring down about their ears," and on the 30th the garrison surrendered. The duke quartered his soldiers in the cathedral, and thirty-one of the rebels were subsequently executed at Harraby Hill. The tower in which Mary Queen of Scots was imprisoned was pulled down in 1835; but a considerable portion of the ancient castle still remains, and it is used as a garrison for the 2d Brigade Depot. Only a small portion of the old city walls now exists, and the city gates have entirely disappeared.

Carlisle suffered in 1380 from a great fire, which destroyed 1500 houses in three of the principal streets; and the plague in 1598 carried off 1076 persons, one-third of the inhabitants.

Carlisle is the see of a bishop. The cathedral was founded by William Rufus, and completed by Henry I. The original proportions of the building have been very

much curtailed. A disastrous fire, in 1292, destroyed the nave, only a small part of which now remains. The most interesting architectural feature of the cathedral is the east window, which has been pronounced by archaeologists to be one of the finest in the kingdom, the harmony of its parts and the easy flow of its lines being particularly remarkable. The remains of Dr Paley are interred in one of its aisles, and a stone pulpit, richly carved in Caen-stone and ornamented with white alabaster, has been erected to his memory. The window in the north transept has been filled with stained glass in memory of the five children of Dr Tait, archbishop of Canterbury, who died of scarlet fever while his grace was dean of Carlisle. The cathedral possesses many memorials of interest. A large portion of the adjacent priory, founded by William Rufus, was destroyed during the civil wars, but the remains may still be traced on the south side of the cathedral. A convent of grey friars which existed in the city was destroyed by the fire in 1292. There was also at one time a convent of black friars, and a hospital founded at St Nicholas for lepers; the latter was destroyed in the 17th century. According to Lyson's *History*, the bowels of Richard Cœur de Lion were buried in Carlisle cathedral.

In addition to the cathedral and the castle, the chief buildings in Carlisle are the court-houses—two large round towers built upon the site of the old citadel; the county jail, contiguous thereto; the news-room, the post-office, the railway station, the infirmary, and two of the joint-stock banks. There is a market-cross in the centre of the market-place, and two marble statues adorn the principal streets. One of these, between the two court-houses (by Musgrave L. Watson), is of William, earl of Lonsdale; the other, in the market-place (by Woodington), is of James Steel, editor and proprietor of the *Carlisle Journal*, a citizen who during his lifetime took a prominent part in local public affairs. In addition to the cathedral there are eight established churches in Carlisle, and several places of worship for Independents, Methodists, Presbyterians, Baptists, and Roman Catholics. Its literary and scientific institutions include a mechanics' institution, a young men's Christian association, and several working men's reading rooms, managed entirely by working men themselves. Its charities consist of an infirmary with 100 beds, a dispensary, and a fever hospital; and in connection with the infirmary there is a convalescent institution at the seaside at Silloth, to which patients are admitted upon payment of a small weekly sum. There is a school-board, of nine members; a school of art; and a cathedral grammar school.

Carlisle is a great railway centre. The London and North-Western, the Midland, the Caledonian, the North British, and the Glasgow and South-Western Railways have each a terminus there; while the North-Eastern Company have access to the city by their Newcastle and Carlisle section. In 1876 more than sixty passenger trains left Carlisle Citadel station every week-day, and as many more entered the city.

The principal business of Carlisle is the manufacture of cotton goods, the finishing of sileries, the printing of calicoes, and the manufacture of bisuits. There are also within the city two or three large iron-works, and the manufacture of felt hats is carried on upon a large scale. A dock and railway to Silloth, on the Solway Frith, 21 miles from Carlisle, were constructed in 1855 to facilitate the transit of the commerce of the district, and this gradually superseded Port Carlisle, which is no longer used as a harbour.

Carlisle returns two members of parliament. Its municipal government is vested in a mayor (unpaid), ten aldermen, and thirty councillors, who also constitute the Urban Sanitary Authority. To them belong the gas-works

and water-works, and by them a system of sewerage was carried out in 1854 at a cost of about £30,000. The city has a recorder and separate court of quarter sessions.

The market is held on Saturdays and Wednesdays, the former being the principal market. The grain is sold in the open street in bulk. Population in 1871, 31,074.

CARLISLE, a town of the United States, capital of Cumberland county in Pennsylvania, about 2½ miles south of the Conedogwinet Creek, and 18 miles west of Harrisburg by the Cumberland Valley Railway. The town is well built, has spacious streets, and contains thirteen churches. Of its public buildings the most interesting is Dickinson College, which was founded in 1783, and possesses an extensive library. In the immediate neighbourhood are barracks, which date from 1777, and are capable of containing 2000 men; and about four miles to the north, in a pleasant valley of the Blue Mountains, is the summer resort known as Carlisle Springs. Carlisle was founded in 1751, and in 1794 it was the headquarters of Washington during the Whisky Rebellion. On the night of 1st July 1863 it was bombarded by the Confederate troops. Population in 1870, 6650.

CARLISLE, FREDERICK HOWARD, FIFTH EARL OF (1748–1825), a statesman and author, was born in 1748. During his youth he was chiefly known as a man of pleasure and fashion; and after he had reached thirty years of age, his appointment on a commission sent out by Lord North to attempt a reconciliation with the American colonies was received with sneers by the Opposition. The failure of the embassy was not, however, due to any incapacity on the part of the earl, but to the unpopularity of the Government from which it received its authority. He was, indeed, considered to have displayed so much ability that he was entrusted with the vice-royalty of Ireland in 1780. The time was one of the greatest difficulty; for while the calm of the country was disturbed by the American rebellion, it was drained of regular troops, and large bands of volunteers not under the control of the Government had been formed. Nevertheless, the two years of Carlisle's rule passed in quietness and prosperity, and the institution of a national bank and other measures which he effected left permanently beneficial results upon the commerce of the island. In 1789, in the discussions as to the regency, Carlisle took a prominent part on the side of the Prince of Wales. In 1791 he opposed Pitt's policy of resistance to the dismemberment of Turkey by Russia; but, on the outbreak of the French Revolution he left the Opposition, and vigorously maintained the cause of war. In 1815 he opposed the enactment of the Corn Laws; but from this time till his death, which occurred in 1825, he took no important part in public life. Carlisle was the author of some political tracts, a number of poems, and two tragedies, the *Father's Revenge* and the *Stepmother*, which received high praise from his contemporaries.

CARLISLE, GEORGE WILLIAM FREDERICK HOWARD, SEVENTH EARL OF (1802–1864), Lord-Lieutenant of Ireland, was born in London, 18th April 1802. He was the eldest son of the sixth earl by his wife Lady Georgiana Cavendish, eldest daughter of the duke of Devonshire, and bore at first the courtesy title of Lord Morpeth. He was educated at Eton and Christ Church, Oxford, where he earned a reputation as a scholar and writer of graceful verse, obtaining in 1821 both the Chancellor's and the Newdigate prizes for a Latin and an English poem. Two years later he graduated B.A. as first class in classics. In 1826 he accompanied his uncle, the duke of Devonshire, to Russia, to attend the coronation of the Emperor Nicholas, and became a great favourite in society at St Petersburg. At the general election of the same year he was returned to parliament as member for the family borough of Mor-

peth. In one of his earliest speeches he post, a town of risk of forfeiting the good opinion of the great wall of defence of the Russian emperor against the German on him in reference to the suppression and remains of insurrection of 1830. In the agitation for skirts of the reform he took the side of Earl Grey; and which are still solution of parliament, which took place at Bowness; he was elected member for Yorkshire. This ambogiana till after the passing of the Reform Bill in 1832 the city, following year he was returned for the West of Scotland still in in 1835 he was appointed by Lord Melbourne Secretary for Ireland, a position at that time of great importance. O'Connell being then at the height of his reputation, his name-prefix post he held for about six years, winning great popularity by his amiable manners and kindly disposition. In 1841, he availed himself of his seat at the election of 1841, he availed himself of his leisure thus afforded him to visit the United States, and afterwards gave an account of this visit in a popular lecture first delivered at Leeds and subsequently repeated at other places. In 1846 he was again elected for the West of Scotland. Two years later, on the death of his father, he succeeded to the peerage and took his seat in the Upper House. He accepted office as Chief Commissioner of Woods and Forests, and afterwards as Chancellor of the Duchy of Lancaster. The great event of his life, however, was his appointment by Lord Palmerston to the Lord-Lieutenancy of Ireland in 1855. This high office he continued to hold till March 1858, and again from June 1859 till within a few months of his death. His retirement in August 1864 was necessitated by failing health. Lord Carlisle was not a man of great and original power, but he was above the average in knowledge, in acquirements, and in eloquence. As a debater he held his own in the midst of a large number of great orators, and in the stormy controversies of his Irish secretaryship he succeeded in carrying through the House of Commons several measures of great importance. His literary tastes and culture were displayed in various popular lectures and in several published works. Among these may be mentioned a lecture on *The Life and Writings of Pope* (1851); *The Last of the Greeks*, a tragedy (1828); a *Diary in Turkish and Greek Waters* (1854), the fruit of travels in the East in 1853 and 1854; and a volume of *Poems*, published after his death. He took warm interest in the reformation of juvenile criminals, and established on his own estate one of the best conducted reformatories in the country. Lord Carlisle died at Castle Howard on the 5th of December 1864. He was never married, and was succeeded in the peerage by his brother. In 1866 appeared his *Viceregal Speeches*, collected and edited by J. Gaskin.

CARLOW, an inland county of Ireland, in the province of Leinster, situated between 52° 26' and 52° 54' N. lat., and 6° 30' and 7° 12' W. long., and comprising an area of 346 square miles, or 221,342 acres. It is bounded N. by Kildare and Wicklow, E. by Wicklow and Wexford, S. by Wexford, and W. by Queen's County and Kilkenny, Excepting Louth it is the smallest county in Ireland.

The surface of the county is in general level or gently undulating, and of pleasing appearance, except the elevated tract of land known as the ridge of Old Leighlin, forming the commencement of the coal measures of Leinster, and the south-eastern portion of the county bordering on Wexford, where the wild and barren granitic elevations of Knockroc (1746 feet) and Mount Leinster (2610 feet) present a bolder aspect.

There are no lakes or canals in the county, neither does it contain the source of any important river; but on its western side it is intersected from north to south by the Barrow, which is navigable throughout the whole extent of the county and affords means of communication

Wexford; while on the eastern border the Slaney, not navigable in any part of its course through the county, passes out of Carlow into Wexford at New Ross. Railway communication connects the county with Dublin, with Wexford, and with Kilkenny and Waterbury.

The geological formation of the county is mainly granitic, and the valley of the Barrow north of Goresbridge presents prominent formations of limestone observed in Ireland, and a great coal district of Leinster commences in the western part of the county at Gallows Hill Bog (974 feet). The limestone is frequently of such a nature as to split easily into layers, known in commerce as Carlow flags. Porcelain exists in the neighbourhood of Tullow; but no attempt has yet been made to turn this production to use.

The soil is of great natural richness. Agriculture is the chief occupation of the inhabitants, but is not so fully developed as the capabilities of the land would suggest. It will be observed from the following table that no progress has been made within the last twenty-two years in the acreage under tillage:—

Year.	Meadow.	Potatoes.	Turnips.	Oats.	Barley Bere, &c.	Wheat.	Under Crops.
1853	21,837	10,608	6,306	27,707	6,700	6,687	84,422
1875	32,151	10,351	5,189	22,165	6,755	2,718	81,638

The pasture land is of excellent quality, and generally occupied as dairy farms,—the butter made in this county maintaining a high reputation in the Dublin market. The farms are frequently large, and great attention is paid to the breeding of cattle. Within the last twenty-two years a large advance has been made in the stock of the county, which was in 1852 and 1875 respectively as follows:—

Year.	Horses, Mules, Asses.	Cattle.	Sheep.	Pigs.	Goats.	Poultry.
1852	9,823	34,531	42,825	22,618	3,501	106,654
1875	10,251	48,672	77,225	23,631	3,361	164,492

The staple trade of the county is in corn, flour, meal, butter, and provisions, which are exported in large quantities. There are no manufactures.

The peasantry dwell chiefly in detached cottages, or in all villages, there being but three towns—Carlow, Bagenalstown, and Tullow—in which the inhabitants exceed 2000 persons.

The population has decreased within the twenty years ending 1871, at a slightly higher rate than that of the province of Leinster in general, owing probably to the want of manufacturing and mining industries. In 1851 the population was 68,078, and in 1871, 51,650 (males 25,464, females 26,186), showing an average decrease of 1.2 per cent. per annum.

In April 1871 there were 6 superior and 99 primary schools in operation, attended by 6454 children, and at the date the following was ascertained to be the state of elementary instruction:—24,496 could read and write; 17,868 could read but could not write; and 17,868, or 34 per cent. of the population, could neither read nor write.

Of the whole inhabitants, 88 per cent. adhere to the Roman Catholic faith, the number professing that religion being 45,621, while 5656 were Episcopalians, and of various other denominations. As regards emigration, the county has contributed more than the average of the province. During the five years 1871 to 1875, there were registered 3881 persons, a number equal to 7½ per cent. of the population at the former date. The poor law union, which does not include the whole county, relieved in 1874, 100 persons or 6½ per cent. of the inhabitants. The county belongs to the diocese of Leighlin and to the military district of Dublin. The assizes are held at Carlow, and quarter sessions at that town and also at Bagenalstown and Tullow. Carlow returns three members to parliament, two for the county and one for the borough of Carlow.

Previous to the arrival of Strongbow, and for some time afterwards, what is now the county of Carlow was divided into the districts of Hy Cabanagh and Hy Drone, forming the northern portion of the principality of Hy Kinselagh. Its most ancient Irish families were the Kavanaghs (descended from the celebrated Maemurrough, king of Leinster), the O'Byans, the O'Nolans, and the O'Mores. After the English settlement, the families of St Aubin, De la Frayne, Birmingham, Carew, De la Landes, Grace, and Butler, held extensive possessions here. In the time of Queen Elizabeth appear the families of Bagnal, Eustace, Burton, O'Brien, Coke, Bernard, Vigors, Burdett, Bunbury, Beaumont, and Browne.

Under the name of Catherlogh, the present county was made shire-ground in the reign of King John. It is now divided into seven baronies,—Carlow, Forth, Idrone East and West, Rathvilly, and St Mullins Lower and Upper, and contains forty-seven parishes and parts of parishes. The relics of antiquity in the county comprise large cromlechs at Browne's Hill near Carlow and at Hacketstown, and a Rath near Leighlin Bridge, in which were found several urns of baked earth, containing only small quantities of dust. Some relics of ecclesiastical and monastic buildings exist, and also the remains of several castles built after the English settlement. The ruins of a round tower existed at the commencement of the present century near the church of Kellystown, but they are not now visible.

CARLOW, a parliamentary borough, and the capital of the county of Carlow, situated on the River Barrow, which is navigable for small craft to its junction with the Grand Canal at Athy, is 45 miles (56 by rail) south-west of Dublin. It is a neat and in some parts a well-built town, of modern aspect. The principal buildings are—the Roman Catholic College of St Patrick, a plain but spacious building, the parish church, an old building, with a handsome steeple of modern erection; the Roman Catholic chapel or cathedral, a large and elegant structure; the court-house where the assizes are held, an octagonal stone building with a handsome Ionic portico; the lunatic asylum for this and the adjoining counties; the county jail; the union workhouse; and barracks for cavalry and infantry. The Wellington bridge over the River Barrow connects Carlow with the suburb of Graigue.

The industries of the place consist of brewing and flour-milling, and a considerable trade is carried on in the sale of butter and eggs.

Carlow was formerly of considerable importance. In the reign of Edward III. the king's exchequer was removed thither, and £500, a large sum at that period, applied towards surrounding the town with a strong wall. The castle (supposed to have been founded by Hugh de Lacy, but sometimes attributed to King John), situated on an eminence overlooking the River Barrow, is still a chief feature of attraction in the general view of the town, although there is not much of the original building left. It consisted of a hollow quadrangle, with a massive round tower at each angle. In the early part of the reign of Queen Elizabeth it was taken, and the town burned by the Irish chieftain Rory Oge O'More. When summoned to surrender by Ireton, the Commonwealth general, during the disastrous war of 1641, Carlow submitted without resistance. In the insurrection of 1798 the castle was attacked by an undisciplined body of insurgents, many of whom were intoxicated. They were speedily repulsed, and suffered severe loss, no quarter being given; and, in the confusion of their flight, many of the insurgents took refuge in houses, which the king's troops immediately set on fire. After the slaughter, about 420 bodies were collected and buried.

The town obtained a charter of incorporation at an early period, and was re-incorporated, with enlarged privileges, by James I. The corporation, which was styled "The Sovereign, Free Burgesses, and Commonalty of the Borough of Catherlogh," and was authorized to return two members to the Irish parliament, was extinguished by the Municipal Reform Act. The borough, which is under the Towns Improvement Act, sends one member to the imperial

parliament. Population in 1851, 9121, inhabiting 1375 houses, and in 1871, 7842, inhabiting 1367 houses.

CARLOWITZ, a town of Hungary, in the former Slavonian military frontier and circle of Peterwardein, is situated on the right bank of the Danube, eight miles south-east of Peterwardein. Population in 1873, 4419. It is the seat of the Greek archbishop in the Austrian dominions, and has, besides the cathedral, two Greek churches, a Roman Catholic church, Servian and German schools, seminaries for the Greek and Catholic clergy, a gymnasium, a lyceum, and a hospital. There is important wine cultivation. The peace between Austria, Turkey, Poland, and Venice was concluded here in 1699.

CARLSBAD, or **KAISERKARLSBAD**, formerly **WARY**, a royal free town of Bohemia, on the Tepel, near its junction with the Eger, 70 miles W.N.W. of Prague. It is situated in a beautiful narrow valley between steep granite mountains, and consists chiefly of lodging-houses and hotels for the accommodation of visitors, but has also some good shops and private houses, a theatre, hospitals, as well as schools, reading-rooms, &c. It is the seat of the district judge, custom-house, and excise. Carlsbad is the most aristocratic watering-place in Europe. It is most frequented from the middle of June to the middle of August, and the number of visitors averaging from 12,000 to 20,000. The permanent population is nearly 9000 (1873). The warm springs differ but little from each other in their component parts, the principal ingredients being sulphate of soda, carbonate of soda, and common salt. Of the ten springs the Sprudel, Hygiea, Bernhardt, Neubrunnen, and Schlossbrunnen are the principal, having temperatures ranging from 165° to 122° Fahr. They are said to have been discovered in 1370, during a hunting excursion, by the Emperor Charles IV., to whom a statue has been erected in the market-place. The resident inhabitants make many curious articles in iron, steel, tin, and wood, for which they find a ready market during the season. The mountains in the neighbourhood have been made accessible, and here and there nice plots of ground have been laid out for visitors. The town has a post-office, railway, and telegraph stations. It lies in 50° 13' N. lat. and 12° 53' E. long.

CARLSBURG, a fortified town of Transylvania, capital of the county of Unter-Weissenburg, situated on the north bank of the Maros, 54 miles south of Clausenburg. It consists of the upper town, or citadel, and the lower town. It has a fine Roman Catholic cathedral (containing among other tombs that of John Hunniades), Lutheran and Reformed churches, and a synagogue; also an ecclesiastical seminary, gymnasium, observatory, public library, mint, &c. Population in 1874, 7955. Lat. 46° 4' 17" N., long. 23° 34' E.

CARLSHAMN, or **KARLSHAVEN**, a small seaport town of Sweden, in the laen of Carlskrona, on the Baltic, 27 miles west of Carlskrona. It has manufactures of sailcloth, leather, and tobacco. The harbour is small but secure, and by means of it a considerable trade is carried on in corn, ironware, timber, pitch, tar, and potash. Shipbuilding and fisheries are also prosecuted. Population in 1873, 5492.

CARLSKRONA, or **BLEKINGE**, a laen or province of Sweden, bounded on the N. by Kronoberg, N.E. by Calmar, E. and S. by the Baltic, and W. by Christianstadt. It has an area of 5398 square miles, and (1873) 127,877 inhabitants. Its principal towns are Carlskrona, Carlshamn, and Soelvestborg. The smallest and most fertile province of the kingdom, it has a mild climate and has been called the garden or park of Sweden. The inhabitants are lively and distinguished for beauty, and the principal industries are connected with agriculture and forestry, fishery, and shipping.

CARLSKRONA, the capital of the above province, a seaport

on the Baltic, in 56° 10' N. lat., 15° 33' E. long., 55 miles east of Christianstadt. It is named from its founder Charles XI., and is built upon five small islands connected with each other and with the mainland by bridges. The town is well built, consisting partly of brick and stone, but principally of wooden houses, and has broad streets. The harbour, which is fortified, is capacious and secure, with a sufficient depth of water for the largest vessels. It has three entrances; the principal, and the only one practicable for large vessels, is on the south side of the town, and is defended by two strong forts. The dry docks are of great extent, and have been cut out of the solid granite rock. The arsenal and other buildings connected with the docks are extensive, and are separated from the town by a wall. The manufactures are naval equipments, linen cloths, tobacco, and refined sugar; the exports, metals, potash, tar, pitch, &c. The town is very deficient in good water. Carlskrona is the principal station of the Swedish navy. It is the seat of the Government and Admiralty offices, has a handsome town-hall, navy-arsenal and hospital, naval and other schools, churches, and navy-yards. Population in 1873, 16,653.

CARLSRUHE, or **KARLSRUHE** (**CHARLES'S REST**), a city of Western Germany, capital of the grand duchy of Baden.

Plan of Carlsruhe.

It stands on an elevated plain of the Hardwald (which nearly surrounds it), 380 feet above the level of the sea, 5 miles from the Rhine, and 39 miles W.N.W. of Stuttgart. The Frankfort and Basel Railway passes the city. Carlsruhe takes its name from Charles William, margrave of Baden, who, owing to disputes which he had with the citizens of Durlach, erected in 1715 a hunting-seat, around which the town has since been built. From the palace the principal streets, seventeen in number, radiate in the form of an expanded fan, in a S.E., S., and S.W. direction. The palace, erected in 1751 on the site of the previous erection of 1715, is a plain building in the old French style, composed of a centre and two wings, presenting nothing remarkable except the octagon tower (*Bleikurm*),

from the summit of which a splendid view of the city and surrounding country is obtained, and the marble saloon, in which the meridian of Cassini was fixed or drawn. In front of the palace is the Great Circle, a semi-circular line of buildings, containing the Government offices and the palace of the margraves of Baden. Carlsruhe has several fine public squares, the principal of which are the Castle-place—with Schwanthaler's statue of the late grand duke Charles Frederick in the centre—and the market-place. In the centre of the latter is a pyramid in honour of Charles William, the founder of the city, whose remains are interred there. Among the public buildings are the council-house, the palace of the margrave of Baden, hall of representatives, mint, post-office, barracks, arsenal, theatre, hall of fine arts, museum, the famed polytechnic school (with 800 students), cannon foundry, a synagogue, and several Protestant and Catholic churches. There are also several hospitals, a deaf-mute asylum, botanic gardens, and lyceum; military, medical, and veterinary schools, academies of architecture, painting, and music, and numerous literary and scientific associations. The town is adorned with several public fountains, and is supplied with water by an aqueduct from Durlach. Carlsruhe carries on a considerable trade, and has engineering, carriage, chemical, silk, cotton, carpet, woollen, jewellery, tobacco, and snuff manufactories. The town is surrounded by beautiful parks and gardens. Population (1875), 43,000. Lat. $49^{\circ} 1' N.$, long. $8^{\circ} 25' E.$

CARLSTAD, a province or laen of Sweden, also called Wermland's Laen. It is bounded W. and N.W. by Norway, N.E. by Falun, E. by Obevo, and S. by Wenersborg and Lake Wener. The surface is mountainous and wooded, and is interspersed with numerous lakes and rivers. The province contains 300 iron mines, 80 foundries, and 300 forges. The neighbourhood of Fyrksdalen is called the Swedish Switzerland. The principal towns are Carlstad, Cristenshamm, and Philipstad. Population in 1873, 263,037.

CARLSTAD, the capital of the above province, stands on the island of Tingvalla, at the mouth of the Clara-Elf, on the north shore of Lake Wener. One of two bridges connecting it with the mainland is the longest and most beautiful stone-bridge in Sweden. The town is the seat of a bishop, and has a handsome cathedral, a gymnasium, a theatre, a cabinet of natural history, and an agricultural society. The Gotha canal has considerably increased its commerce. Carlstad exports copper, iron, salt, timber, &c. It was founded by Charles IX., from whom it takes its name. Population in 1874, 7412.

CARLSTADT, a royal free city of Austrian Croatia, in the comitat of Agram, the capital of the district of the same name, stands on the Kulpa, which here receives the Korana and the Dobra, 32 miles south-west of Agram. It consists of the fortress (which is surrounded by ramparts, trenches, and palisades), the inner town, and a suburb. Carlstadt is the seat of a Greek bishop, and five Catholic churches, a Catholic gymnasium, and many handsome public buildings. It has a considerable transit trade, and manufactures the liqueur called *rosoglio*. It is situated in $45^{\circ} 27' N.$ lat. and $15^{\circ} 36' E.$ long. Population (1871), 5515.

CARLSTADT (**KARLSTADT**), a district of Bavaria, in Lower Franconia, containing 29,014 inhabitants. The capital, of the same name, which is situated on the right bank of the River Main, has a population of 2240.

CARLSTADT, **KARLSTADT**, or **KARLOSTADT** (1480–1541), whose real name was ANDREAS RUDOLF BODENSTEIN, one of the boldest of the German Reformers, first the friend and afterwards the opponent of Martin Luther, was born at Carlstadt in Franconia, in 1480, thus being by three years Luther's senior. In early life he was distinguished by a thirst for knowledge, and a restless disposition which led him to visit various countries and to

pass from school to school. He went to Rome, and there plunged into the scholastic philosophy and theology; and having obtained the degree of bachelor of divinity, he arrived, in 1504, at Wittenberg. Here he was appointed professor at the university, first in the philosophical faculty, and ultimately (in 1513) in the theological. After obtaining his degree of doctor in theology in 1510, he held a canonry and was chosen archdeacon. In 1511 he was appointed dean or rector of the university; and in the following year it fell to his lot to confer the degree of doctor on Luther. At this time their friendship appears to have begun. Carlstadt had already attained a high reputation for learning, eloquence, and logical power. For the purpose of studying the canon law he went a second time to Rome in 1515, returning to Wittenberg in the following year. In the storm of persecution which raged against Reuchlin, Carlstadt took the part of the persecuted scholar. He also adopted about this time the views of Luther; and in April 1517 he published a series of theses in which he asserted that the authority of Holy Scripture was above that of the fathers of the church, and that in the absence of Scripture decision an appeal must be made from the fathers to reason. It was at the end of October in the same year that Luther affixed his theses to the church door at Wittenberg, and Carlstadt strenuously supported him. In 1519 he undertook to hold a disputation with Dr Eck, one of the greatest scholars of the age, on grace and free will. It took place at Leipsic in June, at the very time when the diet was sitting at Frankfort for the election of the emperor. Carlstadt as debater was not able to cope with Eck; and the discussions were tedious and almost fruitless. In the Papal bull against Luther, promulgated in 1520, Carlstadt was particularly named and condemned; and he was the first to appeal from the judgment of the Pope to a general council.

In 1521 he accepted an invitation from Christian II. of Denmark to teach the doctrines of the Reformation in that kingdom, but he made a very short stay there. Differences of opinion and petty jealousies were beginning to spring up between Luther and Carlstadt; and these ripened into bitter discussion and open hostility. Carlstadt's impetuous temper led him to become the advocate of violent measures for the attainment of those ends which Luther and the other Reformers hoped to compass by persuasion. In consequence of the riotous agitation stirred up in Wittenberg by his speeches, writings, and manner of procedure during Luther's confinement in the Wartburg, Luther declared openly against him. For the next two years he remained quiet. But in 1523, being compelled to leave Wittenberg, he retired to Orlamünde in Thuringia, and there got himself elected pastor by the people. His violent proceedings favoured the suspicion that he was associated with the Anabaptists, and was implicated in the schemes of Münzer, leader of the great peasant revolt. The elector of Saxony sent Luther to investigate the true state of things; and when Luther preached against Carlstadt at Jena they held a discussion on the "Real Presence," which Carlstadt was the first to deny, and an open quarrel broke out between them. He was now ordered to leave the territories of the elector. For some time he wandered about from place to place, and at Rotenburg excited fresh tumults and instigated the people to destroy the images and pictures in the churches. Pursued as a promoter of the peasant insurrection, he was driven to strange shifts, and exposed to great hardships, his life even being in danger. In his extremity he wrote to Luther, offering to prove his innocence, and entreating him to intercede for him with the elector, and get permission for him to return to Saxony. Luther listened to him, printed his defence, and succeeded in inducing the elector to comply with his request. For

several years Carlstadt led a quiet, retired life, engaged in farming and commerce. But he grew weary of this enforced suppression of his eager life and longings, and, allying himself with some of the fanatical teachers, he once more attacked Luther. The controversy, in which Zwingli took part in support of the views of Carlstadt on the Supper, grew fiercer than ever; and Carlstadt, the permission for his return to Saxony being now revoked, made his escape into Friesland. Thence he passed into Switzerland, where, through Zwingli's influence, he was named first a deacon in the church of Zurich and then pastor at Altstetten. He afterwards returned to Zurich as archdeacon, and preached there with much success. In 1534 he settled as pastor and professor of theology at Basel, and this post he occupied till his death. To his exemplary Christian character and life at Basel testimony is borne by Grynaeus in a letter to Pitiscus, chaplain of the Elector Palatine. As Carlstadt was the first to assert several of the leading principles of Protestantism, so was he also the first to write against celibacy, and the first Protestant divine to take a wife. His writings, which were almost exclusively polemical, have fallen into oblivion. He died at Basel, December 24, 1541.

CARLUKE, a burgh of barony, in the county of Lanark, Scotland, situated near the right bank of the Clyde, 5 miles north-west of Lanark. Its inhabitants (3423) are principally engaged in cotton-spinning, and in the extensive coal, iron, and lime works in the vicinity.

CARLYLE, JOSEPH DACRE (1759-1804), a celebrated Orientalist, was born in 1759 at Carlisle, where his father was a physician. Having completed his education at the grammar-school, he went in 1775 to Cambridge, was elected a fellow of Queen's College in 1779, and in 1783 took a master's degree. During his stay at college, with the assistance of a native of Baghdad then resident at Cambridge, he had attained great proficiency in Arabic literature; and after succeeding Dr Paley in the chancellorship of Carlisle, he was appointed, in 1794, professor of Arabic in the university of Cambridge. Two years before his appointment he published his translation of the *History of Egypt* written by Maured Allatafet Jemalledin, known in the East as the historiographer of Egypt; and two years after his election to the professorship, a volume of *Specimens of Arabic Poetry*, from the earliest times to the extinction of the khalifs, with some account of the authors. Having been appointed chaplain by Lord Elgin to the embassy at Constantinople, he prosecuted his researches in Eastern literature, and made a lengthened tour through Asia Minor, Palestine, Greece, and Italy, collecting in his travels several valuable Greek and Syriac MSS. for a projected critical edition of the New Testament, collated with the Syriac and other versions—a work, however, which he did not live to complete. On his return he was presented by the bishop of Carlisle to the living of Newcastle-upon-Tyne, where he died in 1804. After his death there appeared a volume of poems, descriptive of the scenes of his travels, with prefaces extracted from his journal. Among other valuable works which he left unfinished was a half-corrected edition of the Bible in Arabic.

CARMAGNOLA, a town of Italy, near the right bank of the Po, in the province of Turin, and 16 miles by rail to the south of that city. It was formerly fortified, and the older portion is still surrounded with walls, while a fragment of its ancient castle is preserved in the form of a tower to the church of San Filippo. It contains five parish churches, several convents, and a hospital. A considerable trade is carried on, especially at the fair in June, in silk, flax, hemp, and cattle. Population in 1869, 12,799. Carmagnola, during the Middle Ages, belonged to the marquises of Saluzzo, and formed one of their frontier

towns. In the 16th century it was fortified by the French, but it fell into the hands of the Savoyards in 1588, and was assigned to them at the peace of 1601. On its capture in 1792 by the army of the Revolution, its name became famous as the title of a republican dancing-song which finished every verse with the refrain—*Dansons la Carmagnole, Vive le son du canon*. The word thus introduced to popularity was soon applied to a vest of common stuff and peculiar shape, which was recognized as the sign of a true Republican; and not long after it was jocularly used to designate the exaggerated reports that were published of the victories of the patriot army.

CARMAGNOLA, FRANCESCO BUSSONE, COUNT OF (1390-1432), one of the most celebrated Condottieri of the early part of the 15th century, was born at Carmagnola in 1390. He was first in the service of Filippo Maria Visconti, duke of Milan, who raised him to the rank of count and made him governor of Genoa. Having, however, lost Visconti's favour, Carmagnola became general of the Venetian army, wrested Brescia from the hands of his old master, and inflicted a severe defeat upon him at Maclodio (1427). But in 1431, having failed to prevent the defeat of the Venetian fleet, and having been unsuccessful in an attempt to surprise Cremona, he incurred the suspicion of the senate, who, not daring to show their disapproval while he was surrounded by his soldiers, lured him to Venice, and there tortured and beheaded him (1432).

CARMARTHEN, COUNTY OF, or CARMARTHENSHIRE (Welsh *Caerfyrddin*), a county in South Wales, bounded on the N. by Cardigan, on the E. by Brecon and Glamorgan, on the S. by Carmarthen Bay, an inlet of the Bristol Channel, and on the W. by Pembroke. Its greatest length is, from S.W. to N.E., about 40 miles; its greatest breadth, S.E. to N.W., about 24 miles. It possesses an area of 947 square miles, or 606,172 acres (of which about 95,600 are occupied by commons and waste land), and is thus the largest of all the Welsh counties. It contains 5 hundreds and 97 parishes, and is in the diocese of St David's.

The whole of the northern, and by far the largest, portion of Carmarthenshire is chiefly occupied by the Silurian geological formation. To the south of this, and crossing the county in a direction from S.W. to N.E., there stretches a belt of the Old Red Sandstone, varying in width from 1½ to 4 or 5 miles. This is succeeded on its southern edge by narrow belts of the carboniferous limestone, and the millstone grit; south of which the whole remaining portion of the county is occupied by the coal measures, forming part of the great South Wales coalfield.

In the south-east adjoining the border of Breconshire, there is a range of bleak and somewhat lofty mountains, called the Mynydd Dû or Black Mountains, where the Carmarthenshire Vau rears its lofty summit about 2600 feet high. The rest of the county is thickly studded with rounded green hills, few of which exceed 1000 feet in height, and is intersected by valleys and glens, many of them presenting scenes of great beauty and interest.

The principal river is the Towy, with its tributaries the Gwili and Cothi, which drains the central basin of the county, and enters the sea in Carmarthen Bay immediately to the east of the river Taf. The latter stream, with its numerous affluents, drains the western portion of the county; while in the north, the Teifi separates Cardigan from Carmarthenshire. The Llwchwr, springing from the Black Mountains, separates in its lower course Glamorgan from this county.

The climate is mild, except in the very elevated parts of the county; but the annual fall of rain is very great, amounting at Carmarthen in 1875 to no less than 60·87 inches. Agriculture is generally not in a very forward

nection with the mountains of Samaria. Composed almost entirely of oolitic formations, it is furrowed externally with numerous ravines and other irregularities, while within it is eaten out into countless caves. Its greatest height is about 1750 feet. By the Biblical authors it is celebrated for its fertility; and its very name, which signifies the "vineyard of the Lord," bears witness to its repnte. At present there are only a few unimportant patches subjected to cultivation; and most of the mountain is covered with a thick brushwood of evergreens which rises at some parts into forest. The tree which more than any other gives its character to the scenery is the *Quercus Ilex*, or prickly oak; but the lentisk and myrtle are also abundant, and the profusion of lesser shrubs and aromatic herbs and flowers is altogether remarkable. The vine is almost extinct except in the neighbourhood of the village of Esia; but wine-presses hewn out of the rock show that its cultivation must at one time have been common. In the poetical books of the Scriptures allusions to Carmel are frequent; and it is especially celebrated in Biblical story as the scene of the sacrifice by Elijah which decided the claims of Jehovah and Baal. The exact site of the prophet's altar is fixed by tradition at El Muharakah at the eastern extremity of the ridge, where a rough structure of hewn stones is still visited as a place of sacrifice by the Druses. Various other places in the neighbourhood are connected with his name in one way or other, and the mountain itself, as well as the convent dedicated to the Virgin Mary, is familiarly known in the East as Mar Elyas. The origin of certain fruit-like fossils, which occur in some of the rocks is explained by the legend that the keeper of a garden, having scornfully refused to let Elijah share in its produce, was punished by his melons and plums being instantly cursed into stone. At a slightly later period the mountain afforded an asylum to the prophet Elisha; and, according to Jamblichus, Pythagoras sought the inspiration of its solitudes. In the time of Vespasian it was the seat of an oracle; and Pliny speaks of its inhabitants as *gens sola et toto in orbe prater ceteras mira*. The sanctity and seclusion of the place attracted a number of Christian hermits as early as the 4th century; and here in the 12th century originated the order of the Carmelites. In 1209 the convent of St Brocardus was founded at the fountain of Elijah; but the monks were massacred in 1238 and the building fell into decay. Another convent was erected in 1631; but it was destroyed in 1821 by Abd-ullah of St Jean d'Acre, who employed the ruins to build the walls of his city. A few years later the building was restored by command of the Porte, the expense being defrayed partly by Abd-ullah and partly by the contributions procured by the monk John Baptist who wandered through a part of Europe, Asia, and Africa in pursuit of his mission. The building is large and commodious, and hospitable entertainment is freely rendered by the fraternity to travellers of any nation or religion whatever. The mountain was at one time dotted with hamlets; but these have been almost all depopulated by the warlike Druses. An attempt to establish American colonists in some of the villages resulted in failure; but in quite recent years considerable success has attended the efforts of a body of German Protestant dissenters, who call themselves Templars. Their principal settlement, founded in 1869, is at Haifa or Caipha, a town of from 2000 to 3000 inhabitants, at the northern end of the promontory, which is usually identified with the Roman *Sycamina*. (See the works of Irby and Mangles, Van de Velde, Thomson, Robinson, Tristram, and Stanley; and for legendary details, Mislin, *Les Saints Lieux*, 1851-57.)

CARMELITES, one of the four orders of Mendicant Friars. It is perhaps difficult to say whether upon the whole the Franciscans or the Carmelites have invented and

propagated the more monstrous fictions respecting their own commencements and subsequent story. But as regards the very tender point of their first foundation, the latter must be admitted to have distanced their competitors. For the history of the Franciscans at least commences with a basis of solid and indubitable historical fact, whereas in the case of the Carmelites we plunge at once into the region of fable, and fable of the most monstrous kind. Mount Carmel is celebrated in Scripture as the abode of Elijah and Elisha, the former of whom the Carmelites claim as their founder. Elijah, or Elias, say the writers of the order, became a monk under the ministry of angels; and his first disciples were Joram, Michu, and Obadiab. They declare further that the wife of the latter, having bound herself by a vow of chastity, received the veil from the hands of Elias himself, and became the first abbess of the Carmelite female order. They tell us also that Pythagoras was a member of this order, and that he had on Mount Carmel several conversations with the Prophet Daniel on the subject of the Trinity. They further assert that the Virgin Mary and Christ himself assumed the habit and profession of Carmelites.¹ We first, however, reach the solid ground of something like history in the account left by Phocas, a Greek monk of the Isle of Patmos, who visited the Holy Land in 1185, and who concludes the narrative of his journeying by relating that the cave of Elias was then visible on Mount Carmel, and that there had existed there a large monastery, the walls still to be seen from the remains of the buildings; that some years previously a monk in priest's orders, with white hair, had arrived there, coming from Calabria, and had established himself there in obedience to orders given him by Elias in a vision. He made, continues Phocas, a small enclosure among the ruins of the monastery, and built a bell tower and a little church. He then collected about ten companions, with whom, concludes Phocas, he still continues to live there. To these recluses, Albert, bishop of Vercelli, who had become patriarch of Constantinople, gave a "rule" about the year 1209. And this must be considered to constitute the foundation of the Carmelite order.

This rule consists of only sixteen articles; and it appears from it that the monks on Mount Carmel were at that time eremitical, dwelling in separate little houses. The lodging of the prior was placed at the entrance into the enclosure, and the church was in the middle of the enclosed space. The rule contains the ordinary injunctions and prohibitions as regards masses and other services to be heard or said, and kinds of food to be avoided, with some unimportant specialities of dates and seasons. Albert further enjoined on them to labour constantly with their hands, and to practise much silence. This rule was approved by Pope Honorius III. in 1226.

It is related that two English crusaders, John de Vesci and Richard de Grey, carried some of the recluses on Mount Carmel with them to England, and founded the first Carmelite monastery in England at Alnwick. Much about the same time—nearly the middle of the 13th century—Louis IX. of France, on his return from the Crusades, took with him to Paris some of the Mount Carmel monks, and established them under the name of Carmelites in a monastery there. Others passed from Mount Carmel into Italy and Spain under the special protection of the popes. The number of their establishments was very rapidly and very largely increased; and they held their first European general chapter at Aylesford in England in 1245.

The Carmelites, however, can refer to papal briefs, bulls,

¹ For a full account of all these absurdities, see a very curious work, printed at Paris in 1751, but with the date of Berlin, entitled *Ordres Monastiques, Histoire extraite de tous les Auteurs qui ont conservé à la posterité ce qu'il y a de plus curieux dans chaque Ordre*.

and rescripts of a much earlier time, in which their existence is recognized John V. (ob. 686), Stephen V. (ob. 817), Leo IV. (ob. 855) Adrian II. (ob. 872), Sergius III. (ob. 911), Gregory VII. (ob. 1085), and Alexander III. (ob. 1181) may be cited among the early popes who conferred privileges or special indulgences on the order. They further quote John XXII. (ob. 1334), Sixtus IV. (ob. 1484), Julius III. (ob. 1555), Pius V. (ob. 1572), Gregory XIII. (ob. 1585), Sixtus V. (ob. 1590), and Clement VIII. (ob. 1605) as having all, in various documents, recognized the fact of their foundation by Elias. And, lastly, Benedict XIII. in 1725, permitted the order to erect in St Peter's, among the statues of the founders of the religious orders, that of Elias as their founder, with the inscription,—*Universus Ordo Carmelitarum fundatori suo Sancto Eliae prophetae erexit!*

The term *Universus* in the above legend is intended to indicate that all the different branches of the order participated in the erection of the statue, although they have become entirely separate societies. The monks of that portion of the order which had adhered to the ancient rule, modified and mitigated, however, in some respects by Innocent IV. (ob. 1254), and more largely by Eugenius IV. (ob. 1447), are termed Carmelites of the Ancient Observance. Shortly after the changes made in the rule by Pope Eugenius IV., several local reformations were effected in the order in different countries,—one in France by the general Jean Soreth of Normandy in 1451, and another in the congregation at Mantua, which rapidly spread itself, and, much to the disgust of the general of that portion of the order which adhered to the old rule, obtained from the Pontiff the right to elect a vicar-general of their own, not subject to the jurisdiction or the approbation of the general. Various other partial reformations were effected, and the members of those congregations which adopted them are styled "Reformed Carmelites." But a more important, or at least a more marked and decided division into two branches was brought about by one of the most noteworthy personages in all the Catholic hagiology, Saint Teresa. This extraordinary woman, a native of Avila, in old Castile, became a Carmelite nun in a nunnery of the order in that city in 1535. She at once determined on carrying out the rule in all its primitive strictness; but finding this insufficient to satisfy her abounding zeal and ambition, she obtained in 1562 a brief from Pope Pius IV. authorizing her to establish a separate branch of the order, the more austere observances of which should be modelled according to her own views. Very shortly several nunneries of "Barefoot Carmelite Nuns" were established, mainly in Spain. Her success thus far soon led her to the more ambitious project of introducing a similar reform among the Carmelite body of the other sex. And this also she accomplished by the assistance of two or three of the leading members of the Carmelite community. The members of the communities which received this reformed rule, or which were founded for the observance of it, were called Barefoot Carmelites (*Carmes Déchaussés*, or *Carmelites à pieds nus*), in distinction to those of the older bodies. For some time, however, the monasteries and nunneries of the Barefoot Carmelites remained subject to the general of the parent body; till in 1550 Pope Gregory XIII. at the instance of Philip II. of Spain, permitted them to elect their own provincial generals, who were, however, still subject to the general of the entire order. But Sixtus V. having regard to the greatly increased and increasing number of their establishments, granted them, in 1587, the privilege of electing a vicar-general of their own. Finally, Clement VIII., in 1593, separated them entirely from the other Carmelites, empowered them to elect a general of their body, and constituted them a separate Order of Friars Mendicant,—dispositions which were subsequently confirmed by Gregory XV.

The Carmelites originally wore white woollen dresses. But inasmuch as the Orientals among whom they dwelt deemed this colour a mark of nobility, they adopted striped dresses, specimens of which may still be seen in ancient paintings, the colours of such stripes being sometimes white, grey, and black, and sometimes white and dark brown. After their establishment in Europe, however, these striped dresses were abandoned, and by the authority of Honorius IV., they began in 1267 to wear a white cape and scapulary, which was, however, shortly afterwards changed for dark brown. Over this dress they now wear a white cloak and hood when they quit their convent.

The device, both of the original body and of the Barefoot Carmelites, consists of a mountain, topped by three stars, and above this a crown, from the middle of which comes forth an arm grasping a sword. The mountain represents Mount Carmel; the stars symbolize the Virgin—*Stella maris*—to whom the order is more especially dedicated; the crown figures forth her supremacy; the arm is the arm of Elias; and the sword it grasps is the token of his zeal. A

line drawn across the top of the mountain differentiates the device as used by the Barefoot Carmelites. The order has been, and is indeed still, a very wide-spread one, in all quarters of the globe.

CARMICHAEL, GERSHOM (1672–1729), a metaphysician of whom Sir William Hamilton has said that he "may be regarded, on good grounds, as the real founder of the Scottish school of philosophy." He was born about the year 1672, probably in London, where his father, a Presbyterian minister who had been banished by the Scotch Privy Council for his religious opinions, was then living. Gershom was educated at Edinburgh University. He graduated there in 1691, and soon after became a Regent at St Andrews. In 1694 he was elected a Master in the University of Glasgow,—an office that was converted into the professorship of Moral Philosophy in 1727, when the system of Masters was abolished at Glasgow. He was an eminently successful teacher, attracting students from England as well as Scotland, but his warm temper led him into various disputes with the principal and other college authorities, in consequence of which he was more than once suspended from his functions. His works are *Breviucula Introductio ad Logicam*, a treatise on logic and the psychology of the intellectual powers, in which among other things he affirms that all knowledge may be resolved into immediate judgments known in their own light; *Synopsis Theologiae Naturalis*; and an edition of Puffendorff *De Officio Hominis et Civis*, with notes and supplements of high value. Carmichael died in 1729.

CARMINE, a pigment of a bright red colour obtained from cochineal. It may be prepared by exhausting cochineal with boiling water and then treating the clear solution with alum, cream of tartar, or acid oxalate of potassium; the colouring and animal matters present in the liquid are thus precipitated. Or an aqueous decoction of black cochineal is made, and treated with stannic chloride: a slow deposition of carmine then takes place; the liquid is poured off, and the carmine dried. Another process is to add to 15 quarts of boiling river water 1 lb of cochineal, and a clear solution of 6 drachms of carbonate of soda in 1 lb of water, and boil for thirty minutes. The liquid is then cooled, and 6 drachms of powdered alum are stirred in. After twenty minutes the resulting scarlet liquid is decanted, mixed well with the white of two eggs beaten up in $\frac{1}{2}$ lb of water, and again boiled for a short time; it is then left quiet for about half an hour, after which it is decanted, and the carmine which has been deposited is drained on a cloth, spread out on plates with an ivory or silver spatula, covered with white paper, and dried. By this process about 1½ oz. of carmine is obtained from 1 lb of cochineal. Another method is to add 3 oz. of nitre and 4 oz. of acid oxalate of potassium to an infusion of 1 lb of cochineal, and to boil for ten minutes. After four hours' standing, the liquid is poured into flat dishes, where it is left for three weeks. At the end of this time it is freed of the coating of mould formed upon it, and is drawn off, leaving a firm layer of carmine of fine colour. There are several other modes of preparing carmine, in some of which gelatine is used to assist its precipitation. The quality of carmine is affected by the temperature and the degree of illumination during its preparation,—sunlight being requisite for the production of a brilliant hue. It differs also according to the amount of alumina present in it. It is sometimes adulterated with cinnabar, starch, and other materials; from these the carmine can be separated by dissolving it in ammonia. Good carmine should crumble readily between the fingers when dry. Chemically, carmine is said to be a compound of colouring matter and a special animal principle with an acid from one of the agents employed to precipitate them.

Its discovery is attributed to a Franciscan monk of Pisa. Carmine is used in the manufacture of artificial flowers, water-colours, rouge, cosmetics, and crimson ink, and in the painting of miniatures. Carmine Lake is a pigment obtained by adding freshly precipitated alumina to decoction of cochineal.

CARMONA, a town of Spain in the province of Seville, situated about 15 miles east of the city of that name, on a gentle elevation that overlooks an extensive plain. Its castle, now in ruins, was formerly the principal fortress of Peter the Cruel, and contained a spacious palace within its defences. The principal entrance to the town is an old Moorish gateway; and the gate on the road to Cordova is partly of Roman construction. Part of the ancient college of San Teodomir is of Moorish architecture, and the tower of the church of San Pedro is an imitation of the Giralda at Seville. The principal trade is in oil, corn, and cattle. Carmona, the Roman Carmo, was the strongest city in Further Spain in the time of Julius Cæsar; and its strength was greatly increased by the Moors, who surrounded it with a wall and ornamented it with fountains and palaces. In 1247 Ferdinand III. of Castile took the city, and bestowed on it the motto—*Sicut Lucifer lucet in Aurora, sic in Wandalia Carmona*. The Carmona fair, which is held in April, affords an almost unequalled opportunity of observing the genuine costumes and customs of southern Spain. Population, 20,704.

CARNAC, a village of France, in the department of Morbihan and arrondissement of L'Orient, about 9 miles south-west of Auray, which is the nearest railway station. It owes its celebrity to the rude stone monuments in its vicinity, which are among the most extensive and interesting of their kind. The most remarkable consist of long avenues of menhirs or standing stones; but there is also a great profusion of other erections, such as dolmens and barrows, throughout the whole district. About half a mile to the north of the village is the Menec system, which consists of eleven lines, numbers 942 menhirs, and extends a distance of 3376 feet. The terminal circle, whose longest diameter is 300 feet, is somewhat difficult to make out, as it is broken by the houses and gardens of a little hamlet. Further to the north-east there is another system at Kermario (Place of the Dead), which consists of 994 stones, many of them of great size—some, for example, 18 feet in height—arranged in ten lines and extending about 4000 feet in length. Still further in the same direction is a third system at Kerlescant (Place of Burning), composed of 266 stones, which are distributed into thirteen lines, terminated by an irregular circle, and altogether extend over a distance of 1000 feet or more. A fourth system at Menec Vilhan, due east of the village of Carnac, has 125 stones. The alignment of Kermario points to the dolmen of Kercado (Place of St Cado), where there is also a barrow, explored in 1863; and to the east of Menec stands the great tumulus of Mont St Michel, which measures 317 feet in length and 192 feet in width at the base, and has at present a height of 33 feet. The tumulus, which is crowned with a chapel, was excavated by René Galles in 1862; and the contents of the sepulchral chamber, which include several jade and fibrolite axes, are preserved in the museum at Vannes. About a mile east of the village is a small piece of moorland called the Boceno, from the *bocenieu* or mounds with which it is covered; and here, in 1874, the explorations of Cleuziou and Mihi brought to light what they suppose to be the remains of a Gallo-Roman town. The tradition of Carnac is that there was once a convent of the Templars or Red Knights on the spot; but this it seems is not supported by history. Similar traces were also discovered at Mané Bras, a height about three miles to the east. The rocks of which these various

monuments are composed is the ordinary granite of the district, and most of them present a strange appearance from their coating of white lichens. For further details the reader may consult the *Prehistoric Times* of Sir John Lubbock, who visited Carnac in 1867 along with Dr Hooker; the *Guide to the Principal Chambered Barrows and other Prehistoric Monuments in the Islands of the Morbihan, &c.* (1875), by W. C. Lukis, who spent considerable portions of seven years in the district; the various publications of René Galles, such as his *Fouilles du Mont Saint Michel en Carnac*, 1864; and *Tumulus et dolmens de Kercado*, 1864; Fouquet's *Des monuments celtiques et des ruines romaines dans le Morbihan*, 1873; *Journal of Anthropol. Soc. of London*, 1869, p. cxxiii.; Jephson's *Walking Tour in Brittany*, 1866; and the *Proceedings of the Soc. of Scot. Antiq.*, 1875.

CARNARVON, COUNTY OF, (Welsh *Caer-yn-arfon*), a maritime county of North Wales, is bounded on the N. by Beaumaris Bay, on the E. by Denbigh, on the S.E. by Merioneth; on the S.W. by Cardigan Bay, and on the W. by the Irish Sea and the Menai Strait. There is a small detached portion of the county on the N. coast of Denbighshire. The greatest length of this county is from north-east to south-west, and measures about 55 miles; while its greatest breadth from south-east to north-west is about 23 miles. Nearly one-half of its whole length forms a spur-like peninsula, varying from five to nine miles in width, projecting in a south-west direction into the Irish Sea, and forming Cardigan Bay on the south, and Carnarvon Bay on the north. The county possesses an area of 579 square miles, or 370,273 acres, and contains 10 hundreds and 76 parishes.

The Lower Silurian and Cambrian beds may be termed the basis of the geological features of this county; but they are so completely penetrated in every direction by intrusive igneous rocks that there is hardly a square mile of surface in the whole county free from their presence. These consist chiefly of compact felspar, feldspathic traps, greenstone, quartz porphyries, and syenite. On the west, along the shore of the Menai Strait, there is a narrow belt of carboniferous limestone; of this the Great Orme's Head is also composed; and on the western side of the peninsular part of the county is a broad band of chlorite and mica schist with serpentine interspersed. Carnarvon is rich in mineral treasures; for, besides lead and copper lodes and an appreciable amount of gold, its numerous slate quarries are amongst the most valuable mineral properties in the United Kingdom, and yield princely incomes to the fortunate possessors, besides furnishing employment to many thousands of workmen.

Carnarvon is the most mountainous of all the Welsh counties, and its mountains are the grandest of any in the British islands south of the Forth. The Snowdon range fills up the whole of the centre of the county; and, with its lofty summits rising to the height of between 3000 and 4000 feet, throws an air of grandeur and sublimity over scenery which is of the most romantic and beautiful description. The summit of Snowdon itself is 3570 feet above the level of the sea, and it is surrounded by a phalanx of giants, many of them but little lower than itself. Among the more important of these, within the county, are the Carnedd Llewelyn, 3482 feet; the Carnedd Dafydd, 3430 feet; the Glyder Fawr, 3275 feet; the Elidyr-fawr, 3033 feet; the Moel Siabod, 2863 feet; Moel Hebog, 2578 feet; and Drum, 2527 feet in height. The rocks of which the Snowdonian range is composed are for the most part of a very bold and rugged description, which adds to the impressiveness of their immense masses.

Some of the valleys are characterized by the extreme of wild and rugged grandeur, being walled in by the naked

great historic importance. It extended along the eastern coast about 600 miles in length, and from 50 to 100 miles in breadth. It was bounded on the N. by the Guntoor circar, the limit being the small River Gundezama, which falls into the sea at Muntapilly, and thence it stretched southward to Cape Comorin. It was divided into the Southern, Central, and Northern Carnatic. The region south of the River Coleroon which passes the town of Trichinopoly, was called the Southern Carnatic. The principal towns of this division were Tanjore, Trichinopoly, Madura, Tranquebar, Negapatam, and Tinevelly. The Central Carnatic extended from the Coleroon River to the River Pennar; its chief towns were Madras, Pondicherry, Arcot, Vellore, Cuddalore, Pullicat, Nellore, &c. The Northern Carnatic extended from the River Peuniar to the northern limit of the country; and the chief towns were Ongole, Carwarec, and Samgaum. The Carnatic, as above defined, comprehended within its limits the maritime provinces of Nellore, Chingleput, South Arcot, Tanjore, Madura, and Tinevelly, besides the inland districts of North Arcot and Trichinopoly. The population of this region consists chiefly of Brahmanical Hindus, the Mahometans being but thinly scattered over the country. The Brahmans rent a great proportion of the land, and also fill different offices in the collection of the revenue and the administration of justice. Throughout the country they appropriate to themselves a particular quarter in every town, generally the strongest part of it. The country in former times was the scene of unremitting violence and strife between the numerous chieftains and petty potentates, among whom it was divided; and forts and fortresses accordingly crown almost all the elevated points. They are built of a square form; from the long period of internal tranquillity which the country has enjoyed, they are now rapidly falling into decay. Large temples and other public monuments of civilization abound. The temples are commonly built in the middle of a square area, and enclosed by a wall 15 or 20 feet high, which conceals them completely from the public view, as they are never raised above it.

In the early centuries of the Christian era, the Carnatic or Carnata seems to have been formed part of the Panja or Pandion kingdom; but about the middle of the 11th century it passed under the power of the Belalas, a family of Rajput race, which at that time was making itself supreme in Southern India. Of the greatness of this dynasty the ruins of Bisuagar, their capital, still give striking witness; but it succumbed before the mightier Mahometan potentates.

The Carnatic was first invaded by this new power in 1310 A.D., when they defeated the Hindu sovereign and conquered the country, which, after being divided between the kingdoms of Bijapore and Golconda, became ultimately tributary to the sovereigns of the Deccan. In the 17th century it was overrun by the armies of Aurungzebe; but it was again dismembered from the Mongol empire in 1717, when Nizam ul-Mulk obtained possession of the Deccan and the south of India. In 1743 he appointed Anwar ud-Deen nabob of the Carnatic, with his capital at Arcot; in 1754 a competition for the government arose; and after a long and tedious war, in which the English and the French took different sides, Mahomet Ali was left in possession of that portion of the Carnatic which was the fruit of the successes achieved by the British. Central Carnatic was laid completely waste by Hyder Ali, but was again reconquered by the British in 1783. In 1801 all the possessions of the nabob of the Carnatic were transferred to the British by a treaty, the conditions of which were, that a revenue of several lacs of pagodas should be reserved to the nabob annually, and that the British should under-

take to support a sufficient civil and military force for the protection of the country and the collection of the revenue. On the death of the nabob in 1853 it was determined to put an end to the nominal sovereignty, a liberal establishment being provided for the family.

The Southern Carnatic, when it came into the possession of the British, was occupied by military chieftains called polygars, who ruled over the country, and held lands by doubtful tenures. They were unquestionably a disorderly race; and the country, by their incessant feuds and plunderings, was one continued scene of strife and violence. Under British rule they have been reduced to order, and their forts and military establishments have been destroyed.

CARNEADES, a Greek philosopher, founder of the Third or New Academy, was born at Cyrene about 213 B.C. Little is known of his life. He learned dialectics under Diogenes the Stoic, and under Hegesinus, the third leader of the Academy in descent from Arcesilaus. The chief objects of his study, however, were the works of Chrysippus, opposition to whose views is the mainspring of his philosophy. "If Chrysippus had not been, I had not been either," he is reported to have said on one occasion. The most notable incident in his life was the embassy to Rome in 156. His eloquence and powerful reasoning excited among the Roman youth an enthusiasm for philosophical speculations, and roused the ire of Cato, who insisted on Carneades, with his companions, being sent from the city. According to Diogenes Laertius, Carneades died in his eighty-fifth year, i.e., in 129 B.C.; according to Cicero he survived to the age of ninety.

Carneades is the most powerful of the ancient sceptics. Fundamentally he is at one with Arcesilaus (see ARCESILAUS); but he carried out his principles with such fulness and skill, both on the negative and on the positive side, that he is called with justice the founder of the New Academy. Negatively, the philosophy of Carneades is a polemic against the Stoic theory of knowledge in all its aspects. Experience, he thinks, clearly shows that there is no true impression. There is no notion that may not deceive us; it is impossible to distinguish between false and true impressions; *φαντασία καταληπτική* must be given up. There is no criterion of truth. Not content with attacking this fundamental position of the Stoic philosophy, Carneades also assailed their theology and physics. In answer to the Stoic doctrine of final cause, of design in nature, he points to those things which cause destruction and danger to man, to the evil committed by men endowed with reason, to the miserable condition of humanity, and to the misfortunes that assail the good man. There is, he concludes, no evidence for the doctrine of a divine superintending providence. Even if there were orderly connection of parts in the universe, this may have resulted quite naturally. No proof can be advanced to show that this world is anything but the product of natural forces. Carneades further attacked the very idea of God. He points out the contradiction between the attributes of infinity and individuality. Like Aristotle, he insists that virtue, being relative, cannot be ascribed to God. Not even intelligence can be an attribute of the divine Being. Many of the arguments employed in this connection by Carneades have little value, but the general line of criticism is highly suggestive and anticipates much in modern thought.

The positive side of Carneades's teaching resembled in all essentials that of Arcesilaus. Knowledge being impossible, a wise man should practise *εποχή*, withholding of judgment. He will not even be sure that he can be sure of nothing. Ideas or notions are never true, but only probable; nevertheless, there are degrees of probability, and hence degrees of belief, leading to action. This theory

of probability was worked out with some care, but little is known of its application to practice. The views of Carneades on the *summum bonum* were not clearly known even to his disciple and successor Clitomachus. He seems to have held that virtue consisted in the direction of activity towards the satisfaction of the natural impulses. Carneades left no written works; his opinions seem to have been systematized by his follower Clitomachus. (See Diog. Laer. bk. iv., Cicero, and Sextus Empiricus. An admirable survey of Carneades is given by Zeller, *Phil. d. Griechen*, iii. pt. 1.)

CARNIOLA (in German, *Krain*), a duchy and crown land of the Austrian empire, bounded on the N. by Carinthia, on the N.E. by Styria, S.E. and S. by Croatia, and W. by Trieste, Görz, and Istria. It has an area of 3857 English square miles, and the civil population in 1869 amounted to 463,273, of whom 220,000 were males and 243,264 females. It is occupied in the N. by the southern slopes and offshoots of the Carinthian Alps, in the W. by the Julian Alps and the Karst or Carso Mountains, and on the S.E. frontier by the Utschoken Mountains. The highest point is the Terglon, which rises to nearly 10,000 feet, and bears on its northern declivity the only glacier in the duchy. No part of Europe presents a greater number of caves, subterranean streams, funnels, and similar phenomena; and the grottoes of Adelsberg, especially, are among the most extensive and interesting in the world. The principal river of the duchy is the Save, which rises in the N.W. corner, and flows south-east; its main source is in the Wochein Lake, and its more important tributaries are the Gurk, the Kraker, and the Leibnitz. The climate is rather severe, and the soil comparatively unproductive. In 1870, by official statistics, there were about 336,731 acres of arable land, 25,844 in vineyards, 406,325 in meadows and gardens, 504,879 in pasture, and 418,017 in woods. Millet is the grain principally grown, and furnishes the favourite national fare; maize is not uncommon, but wheat and rye are rarely met with. The country is rich in mineral wealth; in 1870 it yielded 23,632 tons of quicksilver ore—most of it obtained from the mines of Idria—9401 of iron ore, 7630 of copper ore, 195 of zinc and a small quantity of lead. The weaving of linen and lace is very common throughout the country, and distillation is carried on by a considerable number of the farmers on a small scale. Carniola is divided into the eleven districts of Adelsberg, Gottschee, Gurkfeld, Krainburg, Laibach, Litaj, Loitsch, Radmannsdorf, Rudolfswerth, Stein, and Tchernembl; and the capital Laibach ranks as a separate division. There are fourteen towns, twenty-three market villages, and 3231 hamlets,—the most populous places being Laibach, with 22,593 inhabitants, Upper Idria 3813, Krainburg 2668, and Rudolfswerth 2068. By far the greater part of the population is of Slavonic race,—the German element amounting to little more than a fifteenth of the whole. Nearly all are Roman Catholics, 956 being Protestants, and 315 adherents of the Greek Church. By the law of 1861 the Carniola diet consists of thirty-seven members, including, besides the bishop, ten appointed by the landed proprietors, eight by the towns and centres of industry, sixteen by the rural communes, and two by the commercial chambers at Laibach; six members are sent to the imperial diet. During the Roman empire Carniola formed part of Noricum and Pannonia. Conquered by Charlemagne, the most of the district was bestowed on the duke of Friuli; but in the 10th century the title of margrave of Carniola began to be borne by a family resident in the castle of Kieselberg near Krainburg. Various parts of the present territory were, however, held by other lords, such as the duke of Carinthia and the bishop of Friesing. Towards the close of the 14th century all the separate portions had

come by inheritance or bequest into the hands of Rudolph IV. of Austria, who took the title of duke of Carniola; and since then the duchy has remained a part of the Austrian possessions, except during the short period from 1809 to 1813, when it was incorporated with the French Illyrian Provinces. In 1849 it became a crown land.

CARNIVAL. This word is probably most commonly written in English as it is here given; but it is extremely difficult to say what is the most correct orthography. Of course for the solution of any doubt upon the subject we turn immediately to the Italian vocabularies and practice. But on doing so we find ourselves at the beginning not at the end of our difficulty. Fanfani, whose dictionary is constructed on the basis of the Della Crusca vocabulary, gives only "Carnevale."¹ Moroni also in his ecclesiastical dictionary gives both "Carnevale" and "Carnovale." Boiste, following the "Académie," gives "Carnaval," as the French form. Facciolati in his appendix of low Latin terms gives only *Carnisprivium*. Our mode of writing "Carnival" would seem, therefore, to be the only possible way of spelling the word which is unsupported by the authority of other languages; yet, if that which seems to be the most obvious, and is the most generally accepted meaning and derivation of the word, be the correct one, "Carnival" is surely the most natural form of a word intended to express "farewell to flesh-meat,"—*Carni-vale*. But there are sufficiently strong reasons for doubting whether such be really the etymology of the word. And the generally received notion seems to have naturally suggested itself to those who, understanding the term in its modern, popular, and specially non-Italian meaning, to signify the few last days of licence and feasting immediately preceding Lent, have supposed that this feasting was meant as a sort of valedictory consolation for the privations about to follow. But such is not the proper meaning of the term, and it is hardly yet popularly so understood in Italy. It is still very commonly taken there to signify the whole of the time from the first day of the year to Shrove Tuesday inclusive. But neither is this accurately correct. Carnival time properly begins with the day following the festival of the Epiphany, that is the 7th of January, and lasts till midnight on Shrove Tuesday. Now, although it may be natural enough for those who consider "Carnival" to mean the three or four days of revelry which immediately precede Lent to imagine that such revelry celebrates their coming forty days of abstinence, it is hardly likely that a season of the year beginning between two and three months before such "farewell to flesh" should be named from that circumstance. The Della Crusceans, with Du Cange and Muratori, suppose the word to be derived from *Carnavallare* (*avallare*, Ital. to swallow), from the greater quantity of flesh-meat used at that time of the year. But the Spaniards, following the older low Latin phrase "*Carnisprivium*," speak of Carnival as *Carnes tollendas*. And the phrase met with in the older ecclesiastical writers, *Carnisprivium sacerdotum* (applied to the period beginning with Sexagesima Sunday, from the fact of the regular clergy of most rules having practised a partial abstinence from that day till the beginning of Lent), would not seem to favour the supposition. It is to be observed also that there is another name for the period of carnival, once quite as common in Italy as that of which we are speaking, though now nearly obsolete, *Carnasciale*; and Muratori says that he has nothing to oppose to those who think that *Carnevale* is merely another form of *Carnasciale*, the meaning of which is to abound in (or use unrestrictedly) flesh,—*carne sciature*. Ferrario, on the other hand, maintains that the word was originally merely the same with "Carnalia," indicating an

¹ But the Della Crusca *vocabolario* itself, as well as Du Cange, Muratori, and other authorities, give either form, Carnevale or Carnovale.

origin much earlier than any ecclesiastical observance, and used in the same way as "Saturnalia," "Liberalia," &c.

And, in fact, whatever may have been the origin of the word, there can be little doubt that the origin of the *thing* dates from ante-Christian times. The Bacchanalian festivals of antiquity were celebrated by the Romans, who adopted them from older nations, twice in the year, indicating the early connection of those rites with the phenomena of the solar system, in the winter and in the summer. And the primitive church, finding it, doubtless, impossible to suppress, as it would fain have done, those popular revels, adopted its usual policy of at least fitting them in to its system, and assigning to them a meaning connected with its own practices and observances. The Lupercalian festival in honour of Pan and Ceres, observed in February (which Pope Gelasius I., who died in 496, strove to supersede by substituting for them the festival of the Purification of the Blessed Virgin, with special illumination of candles on the altar *Candlemass*)—also coincided with the period of carnival, as did also (at a little earlier period of the year) the mediæval celebration of the Festival of Fools, equally a survival of the same old Pagan midwinter revelling. Specially the use of masks and torches can be traced as the continuation of ancient practices.

The spirit of compromise, which has so generally characterized the dealings of the church with "the world" is very notable in its attitude towards the popular observances of carnival; and more especially so, as needs must have been the case, in those cities in which the Pope was temporal ruler as well as spiritual pastor. For many generations past these carnival gala doings, especially at Rome, were recognized as an important element in the material prosperity of the city. They were good for trade. They induced large numbers of people, foreigners and provincials, to throng to Rome. The Government of the popes, accordingly, not only looked leniently on carnival excesses, but took active steps to promote and assist the revelry. But the Pope was at the same time the universal bishop of souls! And, as the writer of Moroni's dissertation on the subject says, "If the church tolerates the inveterate custom of carnivalesque diversions, especially the masquerades, groaning all the while, it promotes exercises of piety at the same time, since the consequences of these travesties are dangerous, as affording opportunities for immoral conduct. And the Bacchanalian revelries of carnival, which are nothing else than an imitation of the abominable debauches of Pagans, when they abandon themselves to their passions, have been constantly denounced by the voice of reason, by that of the gospel, by the sacred canons, by the councils, and by all the pontiffs and zealous pastors of the churches, from the earliest ages down to our own days. The church from Septuagesima Sunday covers her altars, and her ministers assume vestments of penitence. She suspends the song of Hallelujah, and mingles tears and sighs of sadness with the joyous accents of the people. She assumes purple-coloured vestments and altar-cloths in sign of mourning, suppresses her hymns, and proposes for our contemplation the fatal fall of our first parents, and the lamentable effects of that great sin." But at the same time the Cardinal Vicar, in whose hands was the police of Rome, was giving special permission for the wearing of masks in the streets, naming the days when people might pelt each other with sham comfits, regulating the exact size and nature of these, and planning the whole arrangement of the revels. Clement IX. (ob. 1669) used to shut himself every year during carnival in the convent of St Sabina in the Aventine, that he might at least not see what he could not avoid tolerating. Clement XI., in 1719 and 1721, issued two apostolical briefs with the view of repressing the licence of carnival. Benedict XIII. (ob. 1730)

always passed the carnival in the strictest retirement in the Dominican convent of St Sixtus. Benedict XIV. (ob. 1758) strove, by an encyclical letter of the 1st of January 1748, to moderate some of the worst excesses of licentiousness to which the carnival every year gave rise. But his efforts mainly restricted themselves to the merely formal points of insisting that the revelry should not be prolonged beyond the midnight of Shrove Tuesday, and forbidding the appearance of masks in the streets on Sundays and Fridays; adding a promise of plenary indulgence to all who would contribute to counterbalance the sins of carnival by the practice of certain extra-devotional exercises during those days. Nevertheless, in the last years which preceded the destruction of the Pope's temporal power, when the inhabitants of Rome were bent on manifesting by every possible means their discontent at the ruling order of things, and their desire to associate themselves with the rest of liberated and united Italy, and for this reason were disposed to abstain from all carnival rejoicings, the priestly Government did everything in its power to promote the usual holiday doings, and excite the people to the accustomed revelry.

The Roman Carnival is recorded by several contemporary writers of records and diaries, to have been especially splendid during the papacy of the great Farnese Pope Paul III., 1534-1549,—days when Rome was still overflowing with wealth sent thither by all tributary Christendom. And the year 1545 is mentioned by several chroniclers as having been marked by special magnificence. The carnival sports seem at that time to have consisted mainly of three divisions, the races in the Corso (which, formerly called the Via Lata, took its present name from them), and the spectacular pageants of the "Agona," now the Piazza Navona, and of the Testaccio. The races seem to have taken place on each of the eight days which were then held to constitute the period devoted to holiday-making. These races seem to have prevailed in one form or another from time immemorial; and before they were run in the Corso, as at present, took place in the open space in the neighbourhood of the Porta St Sebastiano, not far from the present Protestant cemetery. It was in the time of Paul II. (ob. 1471) that they were moved to the Corso. The Piazza del Popolo, which now forms the starting-place, was not then in existence. The races started from the Arch of Domitian, in the immediate vicinity of the Palazzo Fiano, and terminated in the Piazza di Venezia, so named from the huge palace, now the property of Austria, which the Venetian Pope Paul II. (Barbò) had just built. "In these races," says the writer in Moroni's *Dizionario*, "ran, during the eight days of carnival, old and young, boys, Jews, horses, asses, and buffaloes, the prizes consisting in a certain flag or banner called *palo*." The institution of these races as they existed subsequently, and still exist to the present day, belongs to a subsequent period. The principal feature of the carnival, however, in the days we are speaking of, consisted in the so-called sports, "giuochi," of the Agona and the Monte Testaccio. The former seem to have consisted of little more than one of those colossal processions of which that age was so fond. A full account of those processions may be found in a MS. preserved in the Albani library, entitled *The True Progression of the Festival of Agone and Testaccio, celebrated by the Gentlemen of Rome, on the Thursday and the Monday of Carnival in the year 1545, according to the practice of the Ancient Romans, together with a True Description of the Triumphal Cars*.

The following account of the games at Monte Testaccio is abridged from Crescimbeni, who has preserved the description left by a contemporary writer. The Testaccio is an artificial mound of considerable size, composed of potsherds, the accumulation of many generations, long since well covered with turf.

to be thrown, either from the balconies and windows to the carriages, or *vice versa*. Other days are set apart for the throwing of "coriandoli," as they are termed, little round pellets about the size of a pea made of plaster, and manufactured and sold in enormous quantities. These *coriandoli* are supposed to represent confits, which tradition declares to have been the only things thrown in the olden time before the spirit of carnival was, as is supposed, spoiled and vulgarized by the influx of strangers from the north. But the reader has already seen that the flinging of dust, flour, and disagreeable things of all sorts had to be repressed at a very early time. At the present day the principal fun seems to consist in flinging down bushels on bushels of these plaster *coriandoli* on the passers in the streets, mainly in the Corso, from the balconies, and in the return fire of these from the cars which pass up and down the Corso. These cars are huge machines, of which a large waggon forms the basis, built up sometimes in the form of a ship, or a castle, or other such device, and made gay-looking with garlands and abundant bright coloured calico. Some dozen or so of young men, generally in uniform fancy dresses, stand on these machines, and work hard at returning, with such best vigour and activity as they may, the pelt- ing they endure from the balconies. The ladies are mainly the occupants of these. All are masked; those who are prudent wear masks of wire gauze, for a handful of these *coriandoli* vigorously and dexterously thrown point blank into the face is not an attack to be despised. Meanwhile everybody shrieks at the top of his voice, the masks affect a counterfeit and high falsetto note, with which they invariably address the unmasked and each other. Then at a given signal begins the running of the *barbèri*, or riderless horses. Some ten of them are led to the starting place in the Piazza del Popolo, with loosely hanging little spiked machines, contrived to act as spurs, hanging to their sides, and crackers attached to them, which are fired at the moment of starting. A gun gives the signal for the compact crowd in the Corso to make a lane for the horses to run through.

By the aid of the police and soldiers this is more or less satisfactorily accomplished, and the horses dash through it, the crowd closing behind them as they run. Rarely, or perhaps it would be more accurate to say never, does a Carnival pass without two or three accidents, frequently fatal ones, in consequence of incautious persons getting knocked down by the rushing horses. The race is run in about two minutes. The winning "post" is a sheet hung across the street at the spot hence called *Ripresa dei Barbèri*, in the Piazza di Venezia. The prizes consist, as in olden time, of certain standards of velvet, gold lace, and the like, called "*palio*," which are after the race paraded through the Corso. In these days sums of money, 300 or 400 francs, are usually added by the municipality. The price of these prizes was formerly furnished by the Jews, as has been seen. And popular tradition says that the Jews were permitted to furnish the horses and prizes as a concession to humanity, in lieu of running themselves in *propria persona*. It is undoubtedly true that they were so compelled to run. But it would seem that they did not do so *exclusively*, other categories of persons, as the boys, the youths, the old men, having done the same. These races of the *barbèri* were abolished in the year 1874, but were re-established in 1876, in accordance with the wishes of a large portion of the Romans. It remains to mention the peculiar diversion of the *Moschetti* (tapers), which takes place immediately after sunset on Shrove Tuesday. Everybody in the streets, in the balconies and windows, and in the carriages, carries a taper, and everybody endeavours to extinguish the tapers of his neighbours, principally by means of flapping with handkerchiefs, and keep his own alight. All the other features of a modern carnival are common to all the principal Italian cities, but the *Moschetti* and the *Barbèri* are peculiar to Rome. The fun ends by burning at midnight on Shrove Tuesday a colossal figure supposed to represent the carnival. These are the public and out-door aspects of carnival. But besides this all the theatres have masked balls, called *Veglioni* (from *Vigilare*, watch or keep awake, *Veglia*, a vigil, or keeping awake; the addition of the intensive termination *one* gives the word the signification of "a great keeping awake," i.e., a festival to last nearly all night). In all classes of society also carnival is deemed the especial season for bull-fights, and for festivities of all kinds.

Of the other Italian cities, besides Rome, Venice used in old times to be the principal home of carnival. But small remains of it are to be seen there now. A stage, gay with coloured draperies and gas, set up by the municipality in the great square of St Mark, on which a few masked and domineered figures go and dance to music provided by the town, constitutes pretty well the whole of the once celebrated carnival of Venice. Turin, Milan, Florence, Naples, all put forth competing "programmes" for the carnival, all induced by the same motive,—the good of trade. The institution has become everywhere a matter of pure money-getting speculation. Milan and Naples are now the most active competitors with Rome in this respect. In old times Florence was conspicuous for the licentiousness of its carnival; and the *Canti Carnascialeschi*, or Carnival Songs, of Lorenzo de' Medici remain still, though a somewhat rare book, to show to what extent that licence was carried. (T. A. T.)

CARNIVORA, or Flesh-eating Animals, is the name employed to designate the important order of Mammals which contains the dogs, cats, hyænas, weasels, bears, badgers, and others. By some zoologists the Carnivora are divided into the *Pinnipedia*, or aquatic carnivora, as the seals and walrus, and the *Fissipedia*, which are mostly terrestrial, as the dogs, cats, &c. By others again the *Pinnipedia* are regarded as possessing characters sufficiently distinctive to justify their being placed in a separate order of Mammals. See MAMMALIA.

CARNOT, LAZARE NICOLAS MARGUERITE (1753-1823), was born at Nolay in Burgundy, May 13, 1753. After receiving a good mathematical education in his native province, he was admitted as an officer of the engineer corps under the patronage of the prince of Condé; and he was beginning to gain some reputation as an author by means of a prize eulogy on Vauban, two mathematical essays, and a number of verses of no great value, when the Revolution drew him into political life. In 1791 he was returned to the National Assembly for the Pas de Calais, and it was not long before he became a member of the Committee of Public Safety under Robespierre. He took a leading part in the most revolutionary measures; before his election he had addressed a paper to the Assembly proposing the seizure of the property of the church, and he now proposed to arm 30,000 *sans-culottes* with pikes, and to destroy all the citadels in France, and voted for the overthrow of the nobility and the execution of the king. His genius, however, was more military than political; he effected an important improvement in the discipline of the army, and his activity and spirit contributed materially to the successes of the Republic. One of his chief exploits was the victory of Wattignies, where he led in person, and headed a charge on foot. In 1794, after the fall of Robespierre, Carnot had to defend his colleagues, Collot d'Herbois and Barère, from the charge of complicity with the crimes of their leader, and himself only escaped arrest through the glory of his military services. He based his defence on the argument that no member of the Committee was to be held responsible for the deeds of any of the others, since pressure of business made it necessary to sign orders without staying to learn their contents; and, though the excuse is far from sufficient, it was probably true that Carnot, amid the unceasing toils of a minister of war, was not aware of many of the atrocities which were committed. In 1795 he became one of the five directors of the Republic, and it was now that he projected his famous *Plan for the Invasion of England*, by landing two armies simultaneously on the coasts of Sussex and Yorkshire. But not long after he was proscribed, and compelled to take refuge in Germany. Here, though under the protection of a monarch, he published his *Mémoire Justificatif*, in which he declares himself the "irreconcilable enemy of kings." On the downfall of the Directory he returned to France, and became minister of war, but he soon resigned this office, consistently refusing to consent to the election of Napoleon as consul for life; and on the abolition of the tribunate in 1806 he retired into private life, became an active member of the Institute, and devoted himself to the pursuit of science. After the Russian campaign, believing that the independence of France depended upon the success of its emperor, he offered his services to Napoleon, and was made governor of Antwerp, which he defended till the abdication in 1814. He was still faithful to the Republic, and his revolutionary *Mémoire au Roi* did powerful service to the anti-royalist cause. On Napoleon's return from Elba, Carnot was made minister of war, but the time was past for carrying out the vigorous measures which he proposed. On the overthrow of the empire he retired first to Warsaw, and then to Magdeburg, where he died in 1823.

Besides the above-mentioned writings, Carnot was the author of several works on mathematical subjects, of which the best is his *Réflexions sur la Méthode du Calcul Infinitésimal*, and several on political subjects, including *Réponse de Carnot, l'un des fondateurs de la république, au rapport du Bailleul sur la conspiration du 18 fructidor* (1798); *Exploits des français depuis le 22 fructidor au 1^{er} jusqu'au 15 pluviôse an III. de la république*; *Exposé de la situation de l'Empire* (1815); *Exposé de la conduite du général Carnot depuis le 1^{er} juillet 1814*.

CARNUNTUM, an ancient town in Upper Pannonia, on the right bank of the Danube. It was of Celtic foundation, but became at a somewhat early period a Roman post, and was raised to the rank of a colony and a municipium. For three years during his wars with the Marcomanni and Quadi it was the residence of Marcus Aurelius, and here a part of his *Meditations* was composed. The town was taken and destroyed by the German invaders in the 4th century; but it was afterwards rebuilt, and continued to be a place of some importance till its final destruction in the wars against the Magyars in the Middle Ages. Extensive ruins, supposed to be those of Carnuntum, still exist at Hainburg or Hainburg, a small town of Lower Austria, about 24 miles east of Vienna.

CARO, ANNIBALE (1507–1566), poet, was born at Civita Nuova, in 1507. He became tutor in the family of Ludovico Gaddi, a rich Florentine, and then secretary to his brother Giovanni, by whom he was presented to a valuable ecclesiastical preferment at Rome. At Gaddi's death, he entered the service of the Farnese family, and became confidential secretary in succession to Pietro Ludovico, duke of Parma, and to his sons, duke Ottavio and cardinals Ranuccio and Alexander. Caro's most important work was his translation of the *Aeneid* (Venice, 1581, Paris, 1760). He is also the author of *Rime*, *Canzoni*, and sonnets, a comedy named *Gli Straccioni*, and two clever *jeux d'esprit*, one in praise of figs, *La Fischeide*, and another in eulogy of the big nose of Leoni Aneona, president of the Academia della Vertù. Caro's poetry is distinguished by very considerable ability, and particularly by the freedom and grace of its versification; indeed he may be said to have brought the *verso scioltto* to the highest development it has reached in Italy. His prose works consist of translations from Aristotle, Cyprian, and Gregory Nazianzen; and of letters, written in his own name and in those of the cardinals Farnese, which are remarkable both for the baseness they display and for their euphemistic polish and elegance. His fame has been greatly damaged by the virulence with which he attacked Ludovico Castelvetro in one of his canzoni, and by his meanness in denouncing him to the holy office as translator of some of the writings of Melancthon. He died at Rome about 1566.

CAROLAN, TURLOCH, the most famous of the modern Irish bards, was the son of John Carolan or O'Carolan, a respectable descendant of an ancient tribe of East Breifny, a district now forming part of the counties of Meath and Westmeath. He was born at a place called Newtown, near Nobber, in the county of Meath about the year 1670. His father, being reduced to a state of poverty, quitted his native county and eventually settled at Alderford, co. Rosecommon, on the invitation of the family of M'Dermott Roe. It was here that the future bard received his education, which appears to have been very limited, as he never acquired more than a smattering of the English language. In his eighteenth year he was seized with small-pox, and totally deprived of sight. This misfortune led to his becoming a professional bard or itinerant minstrel. His benefactress having provided him with a harp, a horse, and attendant, he began his avocation in his twenty-second year by visiting the houses of the surrounding gentry, his wanderings being chiefly confined to Connaught. It is said, however, that he never played for

hire, and that at the houses where he visited he was welcomed more as a friend than as an itinerant minstrel. To the family of M'Dermott Roe he was attached by the tenderest ties of gratitude and affection, and for them were composed some of his sweetest strains. The number of Carolan's musical pieces, to nearly all of which he composed verses, is said to exceed 200. He died on the 25th March 1738, and was buried at Kilonan. His poetical *Remains* in the original Irish, with English metrical translations by Thomas Furlong, are printed in Hardiman's *Irish Minstrelsy* (1831). Many of his songs are preserved among the Irish MSS. in the British Museum.

CAROLINA, NORTH and SOUTH. See NORTH CAROLINA and SOUTH CAROLINA.

CAROLINE, AMELIA AUGUSTA (1768–1821), wife of George IV. of Great Britain, second daughter of Charles William Ferdinand, duke of Brunswick-Wolfenbüttel, was born on the 17th May 1768. She was brought up with great strictness, and her education did not fit her well for her after station in life. In 1795 she was married to George, the Prince of Wales, who disliked her, and separated from her after the birth of a daughter in January 1796. The princess resided at Blackheath; and as she was thought to have been badly treated by her profligate husband, the sympathies of the people were strongly in her favour. About 1806 reports reflecting on her conduct were circulated so openly, that it was deemed necessary for a commission to inquire into the circumstances. The princess was acquitted of any serious fault, but various improprieties in her conduct were pointed out and censured. In 1814 she left England and travelled on the Continent, residing principally in Italy. On the accession of George in 1820, orders were given that the English ambassadors should prevent the recognition of the princess as queen at any foreign court. Her name also was formally omitted from the liturgy. These acts stirred up a strong feeling in favour of the princess among the English people generally; and she at once made arrangements for returning to England and claiming her rights. She rejected a proposal that she should receive an annuity of £50,000 a year, on condition of renouncing her title and remaining abroad. Further efforts at compromise proved unavailing; the princess arrived in England on the 6th June, and one month later a Bill to dissolve her marriage with the king on the ground of adultery was brought into the House of Lords. The trial began on the 17th August 1820, and on the 10th November the Bill, after passing the third reading, was abandoned. The public excitement had been intense; the boldness of the queen's counsel, Brougham and Denman, unparalleled; and the ministers felt that the smallness of their majority was virtual defeat. The queen was allowed to assume her title, but she was refused admittance to Westminster Hall on the coronation day, July 19, 1821. Mortification at this event seems to have hastened her death, which took place on the 7th August of the same year.

CAROLINE ISLANDS, a widely-scattered archipelago in the Pacific Ocean to the east of the Philippines and the north of New Guinea, between 3° and 11° N. lat., and 135° and 177° E. long. By the Spaniards, who lay claim to the whole, they are divided into the Western, the Central, and the Eastern Carolines.

The Western, better known as the Pelew, Pellew, or Palau Islands, have a total area of 346 square miles, and are nearly encircled by a coral reef. The principal members of the group are Babelthau, with an area of 275 miles, Coröre, Uruedzapel, Jaracong or Errakong, Kiangle, Eimelius, Pellelew, and Angour or Ngaur; and the general title of Errekeltiu Islands is applied to all the archipelago to the south of Babelthau. The surface is frequently well wooded and the soil fertile; and bread-fruit, cocoa-nuts,

sugar-cane, arums, oranges, and bananas are grown in abundance. Cattle, sheep, and pigs have been introduced; there is a great variety of birds, and the lagoons abound with turtle and fish. The inhabitants are a dark copper-coloured race, and bear evident traces of Malay and Papuan blood. Not only the separate islands, but even the villages form independent but co-operative republics. The most peculiar institution is the *Clöbbergoll*, a kind of corporation for purposes of mutual aid and defence. The women have *clöbbergolls* of their own, and possess a considerable share of political influence. The Pelewese still used stone instruments and weapons at the close of last century, but produced a variety of artistic articles with their limited means. They have five kinds of recognized currency in the islands, consisting of pieces or beads of ancient glass and enamel, to which they ascribe a divine origin. The population seems to be rapidly decreasing; Dr Semper calculates that at present the whole group contains 10,000 inhabitants. The Pelews were brought prominently into notice by Captain Henry Wilson, whose ship—the “Antelope”—was wrecked, in August 1783, on one of the islands. A narrative of his residence on the islands was published by George Keate, in 1788. Dr Semper gives a graphic account of his intercourse with the natives in his *Die Palau-Inseln im Stillen Ocean*, 1873; and in the *Journal des Muséum Godeffroy*, Hamburg, 1873, Alfred Tetens describes his visit during 1865–1868.

The Central Carolines, or those which are more usually known as the Carolines proper, consist of about 48 groups with 400 or 500 islands. Omitting Ualan, Puyupet, and Rug the area is hardly 20 square miles, but including them it amounts to 360. The Ngoli, Gulu, or Matelotas group lies to the north-east of the Pelews, and consists of three islands inhabited by a few people from Yap. Yap or Guap lies further to the north-east, is about 10 miles in length, and has an excellent harbour on the south-east. The natives are at a higher level of civilization than most of their neighbours; they cultivate the betel-nut with great care, build first-rate boats, lay out their villages regularly, pave their streets, and construct stone piers and wharves. A Spanish mission was established in the island in 1856. A map and description will be found in the *Godeffroy Journal* for 1873, which also gives an account of the Ulithi, Elivi, or Mackenzie group, previously described by Captain Wilkes of the United States exploration. The Ulea, Swede, and Lütke Islands are of little importance; but the Hugoleu or Rug group, discovered in 1824 by Duperrey, is composed of five large and about forty smaller islands, and contains nearly 35,000 inhabitants, who are divided into two distinct races—a black and a red—which are often at war with each other. The Mortlock or Young William's group, which received its former name from its discoverer in 1793, consists of three atolls called respectively Satoan, Etal, and Lunkunor. The natives, who number about 3400, are of Samoan origin, and are the only worshippers of regular idols in the archipelago. To the north-east lies Ngatik, Nutik, or Raven Island, discovered in 1773, and inhabited by immigrants from Puyupet, greatly mingled with foreign blood. An account of a visit by the “Star” to the last three or four islands is given in the *Geographical Magazine* for 1874. Puyupet (Bornabi, Bonabe, Bonibet, Funopet, or Panapee), also called Ascension by the French, along with the two low atolls of Andema and Paphenemo (known to English sailors as Ant's Islands and Pakeen respectively), constitute the group called by Admiral Lütke the Seniavine. The population at the time of the “Novara's” visit in 1858 was 2000, reduced by small-pox from 5000 in 1846. There is a small colony of whites, and the island has been the seat of an American mission since 1851. The island is the chief rendezvous for the

whalers in that part of the Pacific. There is a remarkable mass of ruins in the centre of the island, which seems to have belonged to a fortification. (See Kubary, “Die Ruinen von Naumatie auf der Insel Ponape,” in the *Godeffroy Journal*.) Ualan Kusai, or Strong's Island, which occupies almost the centre of the Carolines proper, is a volcanic island with an area of about 30 square miles and a population from 700 to 1000. It was discovered in 1804 by the American Crozer, and is the seat of an American mission.

The Eastern Carolines are otherwise known as the Malgrave Archipelago, and comprise the Radak, Ralik, or Marshall group and the Gilbert group. The total population is estimated at 100,000. They were discovered by the two voyagers whose names they bear in 1788.

The Carolines were probably first visited by Alvaro de Saavedra in 1528; in 1579 Drake discovered the Pelews; and in 1686 another group was added to the list by Admiral Francesco Lazemo. To the last-mentioned navigator they owe the name they now bear, which was given in honour of Charles II. of Spain.

See besides the works mentioned above, the voyages of Freycinet, Duperrey, D'Urville, Lütke, and Chamisso; Cheyne's *Islands in the Western Pacific Ocean*, 1852; J. Van der Hoeven, *Beschrijving van Schieds van Inboorlingen der Carolinen-Eilanden*, 1865; and articles by J. B. Davis and W. T. Pritchard in *Anthropological Journal*, 1866.

CARORA, a well-built town of Venezuela, in the province of Barquisimeto, 94 miles S.S.W. of the town of Coro, on the River Moreva or Tocuyo. It carries on a considerable trade in aromatic balsams, gums, cochineal, agricultural productions, cattle, and mules. Before the wars of independence it contained about 9000 or 10,000 inhabitants, and at present it numbers about 6000. Its foundation dates from 1752.

CAROUGE, a town of Switzerland, in the canton of Geneva, and about two miles south of that city, with which it is connected by a horse-railway. It is situated in the midst of fine orchards and meadows; and the neighbourhood is thickly studded with villas. Cotton-spinning and the manufacturing of leather and pottery are the principal industries. About 1780 King Victor Amadeus of Savoy endeavoured to attract the workmen of Geneva to Carouge, and thus to render it the rival of the greater city; but the occupation of his country by the Revolutionary forces in 1792 prevented the success of the undertaking. The population in 1870 was 5871.

CARPATHIAN MOUNTAINS, or KRAPACKS, the eastern wing of the great central mountain system of Europe. They lie between 44° 30' and 49° 40' N. lat., and 17° and 26° E. long., enclosing Transylvania and Hungary, and form a curve 800 miles long, the concavity of which is towards the south-west. The south-eastern extremity of the curve is at Orsova on the Turkish frontier, where the Danube separates it from the northern spurs of the Balkan or Hæmus range. The western extremity is at Presburg in Hungary, on the same river. The breadth of the Carpathian Mountains is between 100 and 200 miles. They form the main water-shed between the northern seas and the Black Sea. The valley of the March divides them from the Silesian and Moravian chains; the valley of the Lower Danube, from the system of the Alps. They are almost entirely in Austrian territory. The chief divisions are the Little Carpathians on the west, between the Waag and the March; to the east of these, the Jablonka Mountains; then the Western Carpathians, or Carpathians proper; and lastly, the East Carpathians to the south-east of Transylvania. The Western Carpathians include the groups of the Tatra, Lomnitz, and Bisztra. Of these the highest is the Tatra, some of the peaks of which are free from snow only one month in the year. The Gerlsdorfer Spitze, the loftiest

point, has an altitude of 8685 feet. On the northern side are some small glaciers, which, however, hardly deserve the name. It is here that the mountain lakes, or "eyes of the sea" are found, in deep hollows between the steep and jagged granitic peaks. The main ridge of the Carpathians running east from the Tatra is called the Waldgebirge, the highest points of which are 2800 feet above sea-level. The Tatra and adjoining groups have a very important influence on the climate of the regions lying south of them, serving as a protection from the north wind. The East Carpathians, the southernmost member of the chain, occupy a quadrangular tract of about 25,500 square miles. The highest point is Mount Butschetje, in South Transylvania; it is 9528 feet in altitude. The chief passes of the Carpathians are those of Tergova, leading from Orsova to Temesvar; Vulcan, in the valley of the Schyl, and Rothe Thurm, in the Aluta valley, at the foot of Mount Surul, both on the south border of Transylvania; Tirsburg, between Bucharest and Kronstadt; Ojitos and Gymos between Moldavia and Transylvania; Borgo, leading from Bistritz to Bukovina; Jablunka on the route from Presburg to Cracow. The Carpathians are rich in metallic ores; lead and quicksilver, and also rock-salt, are obtained from them; there are large copper-workings in Zips, gold and silver mines at Krennmitz and Schemnitz in Hungary, and rich gold ores at Nagyag in Transylvania. Besides these substances, the Carpathians furnish a variety of minerals. Granite is an important constituent of the range. In the Liptan Mountains it is overlain by limestone; and in the Zipfer Mountains it is associated with limestone and gneiss. In the Waldgebirge the large deposits of sandstone afford a poor soil for cultivation. Basalt and other igneous rocks, with the remains of ancient craters, are met with in some districts of the Transylvanian Alps. On the slopes of the Carpathians large quantities of wheat and maize are raised; cattle and sheep are pastured in great numbers; and vineyards and orchards flourish. The vegetation presents four zones; that of the beech extends to 4000 feet above the sea, that of the Scotch fir to 1000 feet higher; above this grows a species of pine, which becomes dwarfed and disappears at an altitude of about 6000 feet, beyond which height is a zone of lichen and moss covered or almost bare rock.

CARPATHEUS, the ancient name of the island of Searpanto, about 30 miles south-west of Rhodes, in that part of the Mediterranean which was called, after it, the *Carpathium Mare*, or Carpathian Sea.

CARPENTARIA, GULF OF, an extensive arm of the sea deeply indenting the north coast of Australia, between 10° 40' and 17° 30' S. lat., and 136° and 142° E. long. It averages 350 miles in length and breadth, and is bounded on the E. by York Peninsula, and on the W. by Arnhem Land. At its south-east corner is situated a group of islands of which the largest is Wellesley; and towards the western side are the Sir Edward Pellew Islands and the Groote Eylandt. A large number of rivers find their way to the gulf, and some of them are of considerable size. On the eastern side there is the Mitchell River; at the south-east corner the Gilbert, the Flinders, the Leichhardt or Disaster, and the Gregory or Albert; and on the west the Roper River. Jan Carstensen, who undertook a voyage of discovery in this part of the globe in 1623, gave the name of Carpentier to a small river near Cape Dniiken in honour of Pieter Carpentier, at that time governor-general of the Dutch Indies; and after the second voyage of Abel Tasman in 1644, the gulf, which he had successfully explored, began to appear on the charts under its present designation.

CARPENTRAS, the chief town of an arrondissement in the department of Vaucluse in France, is situated on the left bank of the Auzon, 15 miles north-east of Avignon,

with which it is connected by means of a branch railway leaving the main line at Sorgues. It is well built, but the streets are narrow. Part of its old walls and towers are still standing, and the Porte d'Orange is a fine specimen of an ancient gateway. Among its buildings the most interesting are the Cathedral of St Siffrein, rebuilt in 1405, a triumphal arch, which forms the only important relic of the Roman period, the old Episcopal palace, and a hospital of the 18th century; and there are also a theatre, a public library of 12,000 volumes, and a museum of antiquities, as well as various municipal buildings. Water is brought to the town by an aqueduct of 48 arches, completed in 1734; and a canal of quite recent construction communicates with the Durance. Soap-works, distilleries, dye-works, and cotton factories are the chief industrial establishments; and there is trade in silk, saffron, oil, honey, and fruits. Carpentras is identified with *Carpentoracte*, a town of Gallia Narbonensis mentioned by Pliny, which appears to have been of some importance during the Roman period. In the Middle Ages its history is full of vicissitudes; it was captured and plundered by Vandal, Lombard, and Saracen. About 1313 it was for a time the residence of Pope Clement V.; and it continued, along with Avignon and the district of the Venaissin, of which it was regarded as the capital, to be administered by the Papal legate till the Revolution. The name of the "Carpentras Inscription" is specially appropriated by Semitic scholars to a few lines of Aramaic preserved on a stone in the Episcopal library, which are remarkable as probably the oldest specimen of rhythmic verse in the Semitic languages (see *Journal Asiatique*, 1868). Population in 1871, 7967.

CARPENTRY. See BUILDING, vol. iv. pp. 476-485.

CARPET is the name applied in modern times to a woven or felted fabric, made generally of wool, which is used for covering the floors of chambers or for spreading on the ground. The term is probably connected with the Latin *tapetes*, whence also comes the word tapestry, which, though now distinctively applied to hangings, was in early times not clearly distinguished from carpeting. Carpets and rugs were originally employed by Oriental nations for sitting, reclining, or devotionally kneeling upon; and when first introduced among Western communities they were also used as covers for tables and couches, or for laying before altars or chairs of state as *pedalin* or foot cloths. The processes for making tapestry hangings and carpets being the same, and the distinction of their application being vague, it was chiefly by the nature of the design that any line was, in mediæval times, drawn between the two classes.

The mention of carpets dates from a very remote period of antiquity. In Egypt they were first applied to religious purposes by the priests of Heliopolis, and were used to garnish the palaces of the Pharaohs. It was also a custom of antiquity to place them under the couches of guests at banquets. Regarding a carpet rug, which he considers to be of ancient Egyptian manufacture, Sir J. Gardner Wilkinson says,—"This rug is made like many cloths of the present day, with woollen threads, on linen strings. In the centre is the figure of a boy in white, with a goose above, the hieroglyphic of 'a child,' upon a green ground, around which is a border composed of red and blue lines," &c. (*Manners and Customs of the Ancient Egyptians*, vol. iii. pp. 141-2). The carpets of the Homeric age were generally white or plain cloths; but they were also sometimes produced with various colours and embroidered designs. At the supper of Iphicrates, purple carpets were spread on the floor; and at the magnificent banquet of Ptolemy Philadelphus (an account of which is given by Callixenus of Rhodes) we learn that underneath 200 golden couches "were strewn purple

carpets of the finest wool, with the carpet pattern on both sides; and there were handsomely embroidered rugs, very beautifully elaborated with figures. Besides this," he adds, "thin Persian cloths covered all the centre space where the guests walked, having most accurate representations of animals embroidered on them" (Athenæus, v. 26). The Babylonians, who were very skilful in weaving cloths of divers colours (Pliny, viii. 48), delineated upon their carpets entire groups of human figures, together with such fabulous animals as the dragon, the sphynx, and the griffin. These were numbered among the luxuries of Elagabalus. On the tomb of Cyrus was spread a purple Babylonian carpet, and another covered the bed whereon his body was placed (Arrian, vi. 29). These carpets were exported in considerable quantities to Greece and Rome, where they were highly esteemed. The pre-eminence of the ancient Babylonian carpet weavers does not appear ever to have been lost by their successors, and at the present time the carpets of Persia are as much prized and as eagerly sought by European nations as they were when ancient Babylon was in its glory.

Oriental carpets were first introduced into Spain by the Moors; and at a later date the Venetians imported them into Italy, and supplied Western Europe with this luxurious manufacture. We have frequent mention of them during the Middle Ages, and their costliness and magnificence are celebrated in the illuminated pages of fabliaux and romances. They were spread in the presence-chambers of royalty, before the high altars of chapels and cathedrals, in the bowers of "ladies faire," and on the summer grass. Many articles of furniture were also covered with them—beds, couches, tables, and regal faldsturies; but here it becomes difficult to distinguish between carpet and tapestry, both being used promiscuously. Tapestry of Baldekine or Baldachine (from Baldak, an ancient name of Baghdad) was a carpet inwrought with gold and silver threads. Such carpets were carried on poles, and uplifted as a canopy over the host, and over great personages in procession. The troubadours had carpets of gold embroidery which they laid upon the grass beneath them. Hearth-rugs and throne carpets, gorgeously emblazoned with heraldic centre-pieces, were the handiwork of high-born dames during the romance period. To some of them were attached fringes, but these were more usually composed of the fag-ends of the warp, like those of Persia, India, and Turkey. A black velvet carpet, "fringed with silver and gold, and lined with taffeta," is enumerated in the inventory of Archbishop Parker's household furniture in 1577. Rushes were strewn on the floor of Queen Mary's presence-chamber, and that of Elizabeth had the additional covering of a Turkey carpet. Long prior to this, however, Eastern carpets had been introduced. In the reign of Edward VI. we read that before communion-tables were placed—

"Carpets full gay,

That wrought were in the Orient."

Chequered matting appears to have been very generally used about the 15th century. In Lydgate's metrical life of St Edmund (MS. Harl., No. 2278), is a representation of the room wherein that saint was born, the floor is covered with chequered matting, and a fringed hearth-rug of Gothic design is before the fire-place. Carpets composed entirely of leather strips interlaced together may be seen in our antiquarian museums.

In the reign of Henry IV. the carpet manufacture appears to have been introduced from Persia into France. Colbert, the minister of Louis XIV., established the manufactory at Beauvais in 1664, which is now in the hands of the French Government, and produces very artistic specimens. A variety of these, "in Turkish, Peruvian, and Chinese styles," was exhibited at London in 1851. The

national manufactory of the Pacific. Treaty to the Great Exhibition, was beautiful carpets and tapestry. (See the Gobelin family, whose established shortly after the auf der Insel Helier (Gilles and Jehan Gobelin), in 1677 by Colbert from Japan Kusai, or supposed, from Flanders. An progenitors, two centuries earlier, centre of the reign of Henry VIII., by William brought their art, as was seen at a fair in England; and under attempt was made, in the time of 1000. It was more successfully Sheldon, to start this manufactory, and is the patronage of James I. established, with the superintendence otherwise both carpets and tapestry at Mortlake in Surrey, where comprise the sum of £2676 were produced. Toward this group. The Royal patron, and French sterling was contributed by its assist. But it does not weavers were brought over to they bear in Nantes in 1685, when appear that anything considerably first visited and, among them the revocation of the Edict of the discovered, and among them artizans of every trade fled to England, added to led in various parts. tapestry and carpet weavers, who set a last-mentioned a premium. About the year 1750, Mr Moore was awarded, which Turkey carpets; by the Society of Arts for the best imitation their manufac- and Parisot conducted an establishment for ages of France at Paddington, under the patronage of the Duke of Cumberland. Subsequently carpets were wrought in the same principle at Axminster, in Devonshire, when, in 1865, a name; and afterwards at Wilton, where the manufac- is still continued. The Board of Trustees for the Encouragement of Arts and Manufactures in Scotland offered prizes for the best Persian and Turkey carpets, which were carried off by Gregory, Thomsons, & Co. of Kilmarnock, and Whytock & Co. of Edinburgh. About ninety years previously they had been made in the vicinity of Holyrood Palace.

Carpets, as manufactured at the present day, range themselves under two classes. The first and ancient class being such as are made by knotting into the warp, tuft after tuft, the materials of the pattern; and the second consisting of those in which the pattern is woven up in the loom. To the first class belong Oriental carpets generally, as well as such as are woven at many places throughout Europe under the name of Turkish carpets. Persia is now as it has been from the most remote times, the recognized source of what is most truly artistic, durable, and valuable, in this manufacture; and after the products of that country those of various parts of India and Turkey are most esteemed.

Persian Carpets.—The carpet weaving of Persia is similar, in its process to the tapestry manufacture of Gobelin, Beauvais, or Aubusson. The tapestry, as is well known, consists of tufts of wool (French *moquettes*) or other fibre sewed on the strings of the warp, by means of small shuttle needles. The Persian carpet is formed by knotting into the warp tuft after tuft of woollen yarn, over each row of which a woof shot is passed, the fingers being here employed instead of the shuttle-needles, as the fabric is of a coarse description. In both methods the principle is the same. Both are formed in looms of very simple construction, the warp threads are arranged in parallel order, whether upright or horizontal, and the fabric and pattern are produced by coloured threads, hand-wrought upon the warp.

In Persia there are entire tribes and families whose occupation is that of carpet-weaving. These dispose of their productions at the bazaars to native merchants, and remove them to Smyrna or Constantinople, where they meet with European purchasers. The finest carpets belong, as to design and texture come from Kerman, Feraghan and Kurdistan. The Kerman products resemble in appearance the finest velvet pile carpets, but with the nap cut much shorter. The carpets of Feraghan are in appearance somewhat like Brussels carpets, while Kurdistan have their pattern on both sides and a

to smooth. The trade in real Persian carpets was formerly limited, owing to their small size, as they were seldom larger than hearth-rugs, long and narrow in shape; but with the extension of the European demand larger carpets are now made, and they are woven in pieces with separate borders, so that they can be sewed together. The introduction of aniline dyes into Persian designs is likely, it is feared, to be detrimental to the mellow effect of native colours. Very many of the imported carpets are considerably tarnished by exposure in bazaars, if they have not indeed been already used. To render these more saleable they are cleaned by cropping the surface, which in some cases is shaved quite close to the knot; hence a proportion of those brought to England have not their original richness and depth of pile. Carpets of silk were at one period extensively made in the country, but this manufacture has been entirely abandoned for more than a century. Felted carpets or *nurmuds* are also very largely made in Persia, but do not constitute an export commodity. Very beautiful patterns are produced in this felt carpeting, by means of coloured tufts of worsted inlaid or inserted during the process of manufacture, producing a regular pattern when finished.

Turkey Carpets.—The greater part of the real Turkey carpets imported into England are manufactured at Ushak or Ouchak, in the province of Aidin, about six days' journey from Smyrna, and rugs are principally made at Kulah, an adjacent village. In the provinces of Khodavendikiar, Adana, and Nish numerous households are employed in their production, as also in the districts of Bozrah, the city of Aleppo, and the villages of Trebizond. Here and there, throughout Carmania, such carpets are also made. The Turcomans of Tripoli, the women of Candia, and the peasants of Tunis and Algiers are likewise engaged in the fabrication of a similar kind of carpet. In none of these places, however, does any large manufactory exist; the carpets are the work of families and households. These carpets are woven in one piece, and there is this notable peculiarity in their manufacture, that the same pattern is never again exactly reproduced; no two carpets are quite alike. The patterns are very remarkable, being rude and simple in design, and coming down from a very remote period. The colours are rich and harmonious, red or green being the usual ground colours with blues, yellows, and black, but very rarely is any white permitted to appear. The design is usually made up of a large central more or less diamonded pattern with smaller diamonds filling up the corners and sides, the whole surrounded with a border of lines of the different colours. No representation of any living form, nearer than what might be taken as the rude outline of leaves, is introduced into the designs. The peculiarities of the patterns have been accounted for on the theory that the Turkey carpet represents inlaid jewelled work, which accords with the Oriental delight in jewels and works in precious stones.

Indian Carpets.—The manufacture of carpets, which have a very wide range of texture, quality, and material, is widely distributed throughout the East Indies. The weaving is carried on entirely by natives, who combine this as a domestic industry with agricultural labour according to the season. It has also been very widely adopted as a proper and profitable species of prison labour. The chief centres of the manufacture of woollen carpets, both for native use and export, are Mirzapore and Benares in the north-west provinces, and Masulipatam in the Madras Presidency, from which latter place the carpets most highly prized in Great Britain are imported.

At Benares and Moorshedabad are produced velvet carpets with gold embroidery. A very elaborate carpet, sent from Kashmir to the Exhibition of 1851 by Maharajah Goolab Singh, was composed entirely of silk, with a pile

nearly an inch thick, in every square foot of which, we are informed, there were at least 10,000 ties or knots. Ornamental hookah carpets and rugs with a silken pile are made in Mooltan, Amritsar, Peshawar, and Kashmir, those of Mooltan being the most famous. Woollen rugs are made very cheaply throughout Bengal and are in great demand; but for texture, workmanship, and colouring the rugs of Ellore, Tanjore, and Mysore are unsurpassed. Cotton carpets or *Suttringeas* are a cheap substitute for woollen fabrics in almost universal use throughout India. They are woven in stripes of either blue and white or red and white,—the principal centres of the manufacture being Agra, Barcilly, Patna, Birbhum, and Bardwan. The price of these articles is generally determined by their weight, but those of Agra are accounted the best. There is considerable variety in the designs of Indian carpets, but it is allowed they exhibit perfection of harmonious colouring. The prevailing colour is a full deep red, broken with leaves, &c., of an orange hue, and interspersed with soft-toned blues or greens. A creamy white is also introduced with excellent effect; but of late years the introduction of bleached whites has robbed the patterns of that mellow subdued effect which constituted one of their leading charms.

Carpets made in this hand or needle-work style to which we have hitherto been alluding have long been made at various places throughout Europe, and the manufacture is still continued. The most celebrated and artistic textures of this class are the Aubusson, Savonnerie, and Beauvais carpets of France, and the similar products of Manufacture Royale de Tapis of Tournai in Belgium. The manufacture of what are called Turkey carpets is also wide spread, and the common Axminster rugs of England are made on the same principle. But the characteristic carpet weaving of Europe is entirely the product of machine or loom work, and of such there are several distinct varieties. Of these the first is the

Kidderminster, or Scotch Carpet.—This is called also the ingrain carpet, and is made in many parts of Scotland and the north of England, and in the United States of America. It consists of worsted warp traversed by woollen weft, and is woven in pieces about a yard wide. It is composed of two distinct webs interlaced together at one operation and is therefore a double or two-ply carpet, similar on its two sides. In this article only two colours can with propriety be introduced, as otherwise it has a striped or mixed appearance. A pure or plain colour can only be obtained where the weft traverses the warp of the same colour. Suppose a crimson figure on a maroon ground; the one web is maroon, the other is crimson, and the pattern is produced by these intersecting each other at fixed points; what is crimson on one side being maroon on the other and *vice versa*. One beam contains the warp of both plies, arranged in two tiers, which is passed through the *mauls* or metallic eyes of the harness—two threads through each eye—and thence through the reed. The harness draws up certain warp threads, to admit of the passage of the shuttle with the weft, the pattern depending upon the warp threads which are so drawn up. This was formerly effected by means of a revolving barrel, whose surface was studded with pins, which by rotation acted upon the warp threads. These studs being arranged so as to produce one pattern, a separate barrel or a new arrangement of the studs was requisite for every other pattern. But this machine is now superseded by the more efficient Jacquard apparatus, which produces the pattern by means of an endless chain of perforated cards working against parallel rows of needles. The successful introduction of the power-loom for the use of the carpet weaver, which was accomplished by Dr Erastus B. Bigelow in America and Mr William Wood in

Patent Axminster Carpets owe their origin to Mr James Templeton of Glasgow, who obtained a patent for his invention in 1839. With a loom as simple as that required for Mr Whytock's patent tapestry, Mr Templeton succeeded in weaving patterns which embrace an unlimited

Preparation of Chenille for Templeton's Carpets.

variety of colours, and that with wool not printed, but dyed in the yarn. Further, these carpets are pile fabrics, and can be woven of a depth equal to any Oriental production; while for density, smoothness, and firmness of texture they cannot be surpassed. The manufacture involves two distinct weaving operations,—1st, the preparation of the chenille the strips of which form the weft, and 2d, the carpet-weaving proper. A design for the carpet to be woven is first prepared and accurately laid down in its proper colours on paper ruled into small squares. This design is then cut into small longitudinal strips and given to the chenille weaver to guide him as to the colours he is to use, and attaching these to the side of his web, he proceeds in regular order with length after length till the whole pattern is woven up (a, in wood-cut). The depth or thickness of the pile to be made is regulated by the spaces missed in passing warp threads through the reed. In the breadth of this web there may be ten, a dozen, or more separate chenilles, and consequently there is that number of separate repeats of the pattern available for the weaving which follows. This first web is cut into threads or strips (b) along its whole length according to the number of separate chenilles it contains, and the loose edges fold together by a peculiarity in the weaving (c), so that a double pile projects upwards from a firmly woven centre or back. The chenille strips now form the weft thread for the second weaving, and being woven into a strong linen or hempen backing in the same order that the strips were cut off from the original pattern, the colours combine as in the pattern, and the elements of the complete design come out as the weaving proceeds. Each length of the chenille strips thus makes up a complete section of the design, and if twelve strips were woven in the breadth of the chenille web, they give the material necessary for twelve repeats. The difficulties which opposed the successful issue of his invention Mr Templeton set himself to combat and overcome with unusual perseverance and determination, and his exertions have been rewarded by his products attaining the highest place in public estimation, and by the establishment of a most extensive trade in his carpets. At a much earlier period than most other manufacturers he perceived the high importance of obtaining the co-operation of the best artists and designers to supply him with appropriate and artistic patterns. In 1851 Mr Templeton obtained designs from Mr E. T. Parris, and later he was fortunate enough to secure the aid of such eminent decorative artists as Mr Digby Wyatt and Mr Owen Jones.

Carpeting of felted-wool upon which coloured patterns are printed are in large demand for crumb-cloths, and as a

cheap covering for the floors of bed-rooms, &c. A very large trade, chiefly export, is now carried on in carpets made from jute fibre. The chief centre of this trade is Dundee, and there the goods are chiefly woven in plain strips or chequered patterns, imitations of Kidderminster or Scotch carpeting being rarely attempted in this inferior fibre. The printing of jute carpets has been accomplished in a manner very pleasing to the eye, but it is feared that such goods would not satisfactorily meet the rougher test of human feet. Matting of coir (from the husk of the cocoanut), Manila hemp (*Musa textilis*), and Indian mat-grass (*Cyperus textilis*), are also in extensive use. Floor-cloths of various kinds come under a separate designation.

From the privately printed lectures of Mr Owen Jones on *The True and the False in the Decorative Arts* we extract the following on carpet-design:—

"Carpets should be darker in tone and more broken in line than any portion of a room, both because they present the largest mass of colour, and because they serve as a background to the furniture placed upon them.

"As a general rule, lighter carpets may be used in rooms thinly furnished than the contrary, as we should otherwise have too overpowering a mass of shade. Turkey carpets are by universal consent adopted for dining-rooms, but not all Turkey carpets (and indeed very few) are fitted for such a purpose. The generality of Turkey carpets consist of a border with the whole middle of the carpet forming one large pattern converging to the centre. All-over patterns are much more rare. In the East, Turkey carpets are placed on a raised platform or dais at one end of a saloon, and all round the edge of it are cushions on which the Easterns recline, so that the whole middle of the carpet is perfectly free, and the complete pattern is seen at a glance. This is not the case when they are transferred to our dining-rooms, where the dining table cuts off the best half of it. . . . The principle of design in a Turkey carpet is perfect, and our manufacturers would do well, instead of copying them in Axminster, as is their wont, to apply the principles to be learnt from them in producing carpets more in harmony with their requirements.

"I will say no more on the floral style, but to express a regret that the more perfect the manufacturing process in carpets becomes the more do they (the carpets) appear to lend themselves to evil. The modest Kidderminster carpet rarely goes wrong, because it cannot; it has to deal with but two colours, and consequently much mischief is beyond its reach. The Brussels carpet, which deals with five colours, is more mischievous. The tapestry carpets, where the colours are still more numerous, are vicious in the extreme; whilst the recent invention of printed carpets, with no bounds to its mobilitie, has become positively criminal." (A. WIL.—J. PA.)

CARPI, a town of Italy in the province of Modena, 10 miles north of that city, on a canal supplied by the Secchia. It is the seat of a bishop, and has a cathedral, a theological seminary, a modern palace, an old castle, and considerable remains of its ancient fortifications. Silk-growing, and silk-weaving, the manufacture of straw hats, and the cultivation of grain, hemp, and flax are the principal occupations of the inhabitants, who number about 17,500. In the 14th and 15th and part of the 16th century, it belonged to the Pico family; but it was taken possession of by Charles V. and bestowed on Alfonso d'Este.

CARPI, GIROLAMO DA (1501–1556), an historical and portrait painter, born at Ferrara, was one of Benvenuto Garofalo's best pupils. Becoming infatuated with the work of Antonio Leti, called Correggio, he quitted Ferrara, and spent several years in copying that master's paintings at Parma, Modena, and elsewhere, succeeding in aping his mannerisms so well as to be able to dispose of his own works as originals by Correggio. It is probable that not a few pictures yet attributed to the great painter are in reality the work of his parasite. Da Carpi's best paintings are a Descent of the Holy Spirit, in the church of St Francis at Rovigi; a Madonna, an Adoration of the Magi, and a St Catharine, at Bologna; and the St George and the St Jerome, at Ferrara.

CARPI, UGO DA (died 1536), a painter, was long held the inventor of the art of painting in chiaroscuro, afterwards brought to such perfection by Parmegiana and by

Baltasar Peruzzi of Siena. The researches of Huber and Breitkopf have proved, however, that this art was known and practised in Germany by Jan Ulrich Pilguin and Mair, at least as early as 1499, while the date of the oldest of Da Carpi's prints is 1518. Printing in chiaroscuro is performed by using several blocks. Da Carpi usually employed three,—one for the outline and darker shadows, another for the lighter shadows, and a third for the half-tint. By means of them he printed engravings after several pictures and after some of the cartoons of Raphael. Of these a Sybil, a Descent from the Cross, and a History of Simon the Sorcerer are the most remarkable.

CARPINI, JOANNES DE PLANO, author of a remarkable mediæval work on Northern Asia. He appears to have been a native of Umbria, where a place formerly called Pian del Carpine, but now Piano della Magione, stands near Perugia, on the road to Cortona. He was one of the companions and disciples of his countryman St Francis of Assisi, and from sundry indications can hardly have been younger than the latter, born in 1182. John bore a high repute in the order, and took a foremost part in the propagation of its teaching in Northern Europe, holding successively the offices of warden (*custos*) in Saxony, and of provincial (*minister*) of Germany, and afterwards of Spain, perhaps of Barbary, and of Cologne. He was in the last post at the time of the great Mongol invasion of Eastern Europe and of the disastrous battle of Liegnitz (April 12, 1241), which threatened to cast European Christendom beneath the feet of barbarous hordes. The dread of the Tartars was, however, still on men's mind four years later, when Pope Innocent IV. determined (1245) on sending a mission to the Tartar and other Asiatic princes, the real object of which apparently was to gain trustworthy information regarding the hordes and their purposes.

At the head of this mission the Pope placed Friar John, at this time certainly not far from 65 years of age, and to his discretion nearly everything in the accomplishment of the mission seems to have been left. The legate started from Lyons, where the Pope then resided, on Easter Day (16th April 1245), accompanied by another friar, who speedily broke down and was left behind. After seeking the counsel of an old friend, Wenceslaus, king of Bohemia, he was joined at Breslau by another minorite, F. Bennet the Pole, appointed to act as interpreter. The onward journey lay by Kiev; the Tartar posts were entered at Kaniev, and thence the route ran across the Dnieper (*Neper*) and the Don to the *Ethil* or Volga, on which stood the *Ordu* or camp of Batu, at this time the senior of the Chinghizid family. Here the envoys with their presents had to pass between two fires before being presented to the prince. Batu ordered them to proceed onward to the court of the supreme Kaan in Mongolia, and on Easter Day once more (April 8, 1246) they started on the second and most formidable part of their journey—"so ill," writes the legate, "that we could scarcely sit a horse; and throughout all that Lent our food had been nought but millet with salt and water, and with only snow melted in a kettle for drink." Their bodies were tightly bandaged to enable them to endure the excessive fatigue of this enormous ride, which led them across the *Taïc* (now called River Ural), and then north of the Caspian and the Aral to the Jaxartes (*quidam fluvius magnus cujus nomen ignoramus*), and the Mahometan cities which then stood on its banks; then along the shores of the Dzungarian lakes and so forward, till, on the Feast of St Mary Magdalene (22d July), at last they reached the imperial camp called *Sira Ordu* (Yellow Pavilion), near the Orkhon River,—this stout-hearted old man having thus ridden something like 3000 miles in 106 days.

Since the death of Okkodai the imperial authority had been in *interregnum*. Kuyuk, his eldest son, had now been

designated to the throne; his formal election in a great *Kurultai*, or diet of the tribes, took place while the friars were at Sira Ordu, numbered among 3000 to 4000 envoys and deputies from all parts of Asia and Eastern Europe, bearing homage, tribute, and presents. They afterwards, on the 24th of August, witnessed the formal enthronement at another camp in the vicinity called the Golden Ordu, after which they were presented to the emperor.

It was not till November that they got their dismissal, bearing a letter to the Pope in Mongol, Arabic, and Latin, which was little else than a brief imperious assertion of the Kaan's office as the scourge of God. Then commenced their long winter journey homeward; often they had to lie on the bare snow, or on the ground scraped bare of snow with the traveller's foot. They reached Kiev on the 9th of June 1247. There, and on their further journey, the Slavonic Christians welcomed them as risen from the dead, with festive hospitality. Crossing the Rhine at Cologne, they found the Pope still at Lyons, and there delivered their report and the Kaan's letter.

Not long afterwards Friar John was rewarded with the archbishopric of Autivari in Dalmatia, and was sent as legate to St Louis. We do not know the year of his death, but it would seem that his *successor* in the see died before April 1253; hence it is probable that John did not long survive the hardships of his journey.

He recorded the information that he had collected in a work, called in one MS. *Liber Tartarorum*, in another *Historia Mongolorum quos nos Tartaros appellamus*. The work is divided into eight ample chapters on the country, climate, manners, religion, character, history, policy, and tactics of the Tartars, and on the best way of opposing them, followed by a single chapter on the regions passed through. The book thus answers to its title. Like some other famous mediæval itineraries it shows an entire absence of a traveller's or author's egotism, and contains, even in the last chapter, scarcely any personal narrative. John of Pian del Carpine was not only an old man when he went cheerfully upon this mission, but was, as we know from accidental evidence in the annals of his order, a fat and heavy man (*vir gravis et corpulentus*), inasmuch that during his preachings in Germany he was fain, contrary to Franciscan precedent, to ride a donkey. Yet not a word approaching more nearly to complaint than those which we have quoted above appears in his narrative. His book, both in its defect of personal detail and in literary quality, is inferior to that written a few years later by a younger brother of the order, and envoy to the Mongol, William de Rubruck. But it is an excellent work, and in our own day an educated Mongol, Galsang Gombeyev, has borne detailed and interesting testimony to the great accuracy of its statements (see *Mélanges Asiat. tirés du Bullet. Hist. Philol. de l'Acad. Imp. de St Petersburg*, ii. p. 650, 1856).

The book must have been prepared immediately after the return of the traveller, for the Friar Salimbene, who met him in France in the very year of his return (1247), gives us these interesting particulars:—"He was a clever and conversable man, well lettered, a great discourser, and full of a diversity of experience. . . . He wrote a big book about the Tatars (*sic*), and about other marvels that he had seen, and whenever he felt weary of telling about the Tatars, he would cause that book of his to be read, as I have often heard and seen" (*Chron. Fr. Salimbene Parmensis in Monum. Histor. ad Prov. et Placent. pertinentia*, Parma, 1857).

For a long time the work was but partially known, and that chiefly through an abridgment in the vast compilation of Vincent of Beauvais (*Speculum Historiale*) made in the generation following the traveller's own, and printed first in 1473. Hakluyt (1598) and Bergeron (1634) published portions of the original work; but the complete and genuine text was not printed till 1839, when it was put forth by the late M. D'Avezac in the 4th volume of the *Résumé de Voyages et de Mémoires* of the Geog. Society of Paris,—a work of that great geographer which forms such a model of editorial taste, learning, and sagacity, as will hardly be surpassed or equalled.

John's companion, Benedictus Polonus, also left a brief narrative taken down from his oral relation. This was first published by M. D'Avezac in the work just named. (H. Y.)

CARPOCRATES, a Gnostic of the 2d century, about whose life and opinions comparatively little is known. He is said to have been a native of Alexandria and by birth a Jew. His family, however, seem to have been converted to Christianity. His Gnostic theory was for the most part

founded upon Platonism, and he made especial use of the doctrines of reminiscence and pre-existence of souls. He regarded the world as formed by inferior spirits who are out of harmony with the supreme unity, knowledge of which is the true *Gnosis*. The souls which remember their pre-existing state can attain to this contemplation of unity, and thereby rise superior to all the ordinary doctrines of religion or life. Jesus is but a man in whom this reminiscence is unusually strong, and who has consequently attained to unusual spiritual excellence and power. To the Gnostic the things of the world are worthless; they are to him matters of indifference. From this position it easily followed that actions, being merely external, were morally indifferent, and that the true Gnostic should abandon himself to every lust with perfect indifference. The express declaration of these Antinomian principles is said to have been given by Epiphaneus, son of Carpocrates. The notorious licentiousness of the sect was the carrying out of their theory into practice.

CARPZOV (in Latin *Carpovius*), the name of a family, many of whose members attained distinction in Saxony in the 17th and 18th centuries as jurists, theologians, and statesmen. They traced their origin to Simon Carpzov, who was burgomaster of Brandenburg in the middle of the 16th century, and who left two sons, Joachim and Benedict.

BENEDICT CARPZOV (1565–1624), first of this name, second son of Simon, was an eminent jurist. He was born in Brandenburg in 1565, and was educated at the universities of Frankfurt and Wittenberg and other German schools. He returned home in 1590, and was soon after nominated assessor in law. In 1595 he was appointed professor of law at Wittenberg, whence he removed in 1602 to the court of Sophia, electress of Saxony, at Colditz, who named him her chancellor. After some years he returned to Wittenberg, and died there, November 26, 1624, leaving five sons. He published a collection of writings entitled *Disputationes juridicæ*.

BENEDICT CARPZOV (1595–1666), second of the name, was the second son of the preceding, and like him was a great lawyer. He was born at Wittenberg in 1595, was at first a professor at Leipsic, obtained an honourable post at Dresden in 1639, became Ordinary of the Faculty of Jurists at Leipsic in 1645, and was named privy councillor at Dresden in 1653. Among his works, which had a very extensive influence on the administration of justice, even beyond the limits of Saxony, are,—*Definitiones forenses* (1638), *Practica nova rerum criminalium* (1635), *Opus decisionum illustrium Saxonie* (1646), *Processus juris Saxonici* (1657), &c. His last years were spent at Leipsic, and his time was entirely devoted to sacred studies. He read the Bible through fifty-three times, studying also the comments of Osiander and Crauer, and making voluminous notes. These have been allowed to remain in manuscript. He died at Leipsic, August 30, 1666.

AUGUST CARPZOV (1612–1683), fourth son of the first Benedict, distinguished himself as a diplomatist. Born at Colditz in 1612, engaged first as advocator of the court at Wittenberg, he was appointed in 1657 chancellor and president of the Consistory at Coburg, and from 1675 till his death was privy councillor at Gotha. He took part in negotiating the treaties of Osnaburg and Nuremberg. Like his brother he was a man of earnest piety, and published several devotional works. He died at Coburg, November 19, 1683.

JOHANN BENEDICT CARPZOV (1607–1657), fifth son of the first Benedict, was born at Rochlitz in 1607, became professor of theology at Leipsic, made himself known by a *Systema Theologicum*, in two volumes, and died at Leipsic, October 22, 1657, leaving five sons, all of whom attained some literary eminence.

JOHANN GOTTLÖB CARPZOV (1679–1767), grandson of the preceding, was born at Dresden in 1679. He was educated at Wittenberg, Leipsic, and Altdorf, became a learned theologian, and in 1719 was called to the chair of Oriental languages at Leipsic. In 1730 he was appointed superintendent and first pastor at Lübeck. His most important works were the *Introductio in libros canonicos bibliorum Veteris Testamenti*, and *Critica surra V. T.* He died at Lübeck, April 7, 1767.

JOHANN BENEDICT CARPZOV (1720–1803), grandson of the first Johann Benedict, was a distinguished classical scholar. He was born at Leipsic in 1720, became professor of philosophy there in 1747, and in the following year removed to Helmstädt as professor of poetry and Greek. In 1749 he was named also professor of theology. He was author of various philological works, wrote a dissertation on Moneius, and published an edition of Musæus. He died April 28, 1803.

CARRANZA, BARTELOMÉ DE (1503–1576), a Spanish primate and theologian, was born of noble family at Miranda in Navarre, in 1503. He studied at the university of Alcalá, and entered the Dominican order. The only Spaniard who could pretend to rival him in learning was Melchior Canus, and as professor of theology at Valladolid he gained so brilliant a reputation that students flocked thither from all parts of Spain to hear him. Charles V. selected him as envoy to the Council of Trent (1546). At this council he earnestly maintained that it was the duty of priests to reside in their benefices; and next year he (1547) followed up this appeal by publishing at Venice *De necessaria residentia episcoporum et aliorum pastorum*. He was also chosen by Charles to accompany to England the prince who afterwards became Philip II., on the visit which he made for the purpose of marrying Mary. Carranza became that queen's confessor, and laboured very zealously for the re-establishment of Roman Catholicism. In 1557 Philip appointed him to the archbishopric of Toledo, a post he was very reluctant to accept, as he foresaw the jealousy which his promotion would arouse; and indeed the bishop of Lérida the very next year denounced him to the Inquisition as a heretic, taking as pretext his *Commentarios sobre el catechismo Christiano*, published that year at Antwerp, though that book was approved by a commission of the Council of Trent. It was placed in the *Index Expurgatorius*, and Carranza was imprisoned for eight years, after which, on appealing to Rome, he was taken thither and confined (1566–1576) in the castle of St Angelo. In 1576 he received final sentence, being made to abjure opinions which he had never held, suspended from his archbishopric for five years, and banished to the Dominican convent of Minerva. Seven days after this judgment he died. The people of Spain honoured him as a saint, and Gregory XIII. placed a highly laudatory inscription on his tomb. His most famous work, *Summa Conciliorum*, first published at Venice in 1546, is of considerable value, and has been frequently reprinted.

CARRARA, a town of Italy, in the province of Massa-Carrara, about 62 miles north-west of Florence, is situated not far from the coast of the Mediterranean, in a deep valley watered by the Avenza. The principal buildings are the collegiate church of St Andrea, the Madonna delle Grazie, and the ex-ducal palace. The town owes its whole importance, as well as its very name, to the quarries in the neighbouring mountains, which from a very early period have been one of the principal sources of statuary marble in the world. They are for the most part situated close to the village of Torano, about a mile distant from the town. Of the 450 quarries at present in full working order, the best are those known as Canal Grande, Poggio, Donzio, and Palvaecio. The excavation gives employment to about

6000 men; and nearly 4000 are engaged in the cutting and polishing shops, which number about 115. In 1873 the total value of the marble extracted was £360,000. Carrara is built not far from the site of the ancient *Luna*, an Etrurian city of considerable importance; and the marble was known to the Romans as *Marmor Lunense*. Napoleon I. founded in the town an academy of fine arts, which still exists and possesses a large collection of statues. The only native sculptors of note are Alberti Maffeioli in the 15th century and Danese Cattaneo in the 16th. The population of the town proper is about 8000, but the commune contains 23,827.

CARREL, ARMAND, or more fully JEAN BAPTISTE NICOLAS ARMAND (1800-1836), a distinguished French publicist, was born at Ronen, 8th May 1800. His father was a merchant in good circumstances, and he received a liberal education at the college of his native town, afterwards attending the military school at St Cyr. He had an intense admiration for the great generals of Napoleon, and his uncompromising spirit and bold uprightness soon marked him out as a man of independent views, and to be suspected. Entering the army as sub-lieutenant he took a secret but active part in the unsuccessful conspiracy of Belfort. On the outbreak of war with Spain in 1822, Carrel, whose sympathies were altogether with the Spanish cause, sent in his resignation, and succeeded in effecting his escape to Barcelona. He enrolled himself in the foreign legion and fought gallantly against his former comrades. Near Figuières the legion was compelled to surrender, and Carrel became the prisoner of his old general, Damas. There was considerable difficulty about the terms of capitulation, and one council of war condemned Carrel to death. Fortunately some informality prevented the sentence being executed, and he was soon afterwards acquitted and set at liberty.

His career as a soldier being then finally closed, Carrel resolved to devote himself to literature. He came to Paris and began as secretary to Augustin Thierry, the celebrated historian. His services were found to be of great value, and on his side he not only obtained admirable training in habits of composition, but was led to investigate for himself some of the most interesting portions of English history. His first work of importance (he had already written one or two historical abstracts) was the *History of the Counter-Revolution in England*, an exceedingly able political study of the events which culminated in the Revolution of 1688. He gradually became known as a skilful writer in various periodicals; but it was not till he formed his connection with the *National* that he became a power in France. The *National* was at first conducted by Thiers, Mignet, and Carrel in conjunction; but after the revolution of July, Thiers and Mignet assumed office, and the whole management fell into the hands of Carrel. Under his direction the journal became the first political organ in Paris. His judgment was unusually clear, his principles solid and well founded, his sincerity and honesty beyond question; and to these qualities he united an admirable style, lucid, precise, and well balanced. As the defender of democracy he had frequently to face serious dangers. He was once in Ste Pelagie, and several times before the tribunal to answer for his journal. Nor was he in less danger from private enmities. Before his last fatal encounter he was twice engaged in duels with editors of rival papers. The dispute which led to the duel with M. Émile de Girardin was one of small moment, and might have been amicably arranged had it not been for some slight obstinacy on Carrel's part. The meeting took place on the morning of the 22d May 1836. De Girardin was wounded in the shoulder, Carrel in the abdomen. The wound was at once seen to be dangerous, and Carrel was conveyed to the house of a friend, where

he died after two days' suffering. His works, with biographical notice by Littré, have been published in five volumes (Paris, 1858). A fine estimate of his character will be found in Mill's *Dissertations*, vol. i.

CARRIAGE, a term which in its widest signification includes all structures employed for the purposes of transport of merchandize and movable goods and of human beings. Such vehicles are generally mounted on wheels, but the sledge and the litter are types of the exception to this rule. Carriages, according to the definition above given, includes in these days a vast variety of forms, ranging from the humble wheel-barrow and rude farin-cart up to the luxuriously appointed sleeping-cars of railways, and the state carriages of royal personages. A narrower application, however, limits the term to such vehicles as are used for the conveyance of persons, and it is in this restricted sense that the term is here used. Cars or carriages for use on railways or tramways are also excluded, and will be dealt with in other connections.

Although, doubtless, the primitive means of transport was by riding on the back of the horse, camel, elephant, or other animal, there is evidence that the use of certain kinds of carriages dates from a very remote antiquity. When Pharaoh advanced Joseph to the second place in Egypt "he made him to ride in the second chariot which he had;" and later, Joseph, by command of the king, sent waggons out of the land of Egypt to convey Jacob and his whole family to the land of his adoption. Thus at this early period there were two distinct types of carriage in use among the civilized inhabitants of Egypt,—a country which from its level character presented facilities for the development of this species of conveyance. The use of chariots in Egypt and among early nations generally was reserved for rulers and warlike leaders.

It was among the Romans that the use of carriages as a private means of conveyance was first established, and with that people carriages attained great variety of form as well as richness of ornamentation. In all times the employment of carriages depended greatly on the condition of the roads over which they had to be driven, and the establishment of good roads, such as the Appian Way, constructed 331 B.C., and others, greatly facilitated the development of carriage travelling among the Romans. In Rome itself, and probably also in other large towns, it was necessary to restrict travelling in carriages to a few persons of high rank, owing to the narrowness and crowded state of the streets. For the same reason the transport of goods along the streets was forbidden during the ten hours between sunrise and sunset. For long journeys and to convey large parties the *reda* and *carruca* appear to have been mostly used, but what their construction and arrangements were is not known. During the empire the carriage which appears in representations of public ceremonials is the *carpentum*. It is very slight, with two wheels, sometimes covered, and generally drawn by two horses. If a carriage had four horses they were yoked abreast, among the Greeks and Romans, not in two pairs as now. From the *carruca* are traced the modern European names,—the English *carriage*, the French *carrosse*, and the Italian *carrozza*. The *sirpea* was a very ancient form of vehicle, the body of which was of osier basket-work. It originated with the Gauls, by whom it was named *benna*, and by them it was employed for the conveyance of persons and goods in time of peace, and baggage during war. With its name are connected the modern French *banne*, *banneton*, *vannerie*, and *panier*,—all indicating basket-work. The *essedum* was a two-wheeled carriage, the form of which the Romans copied from the war cars of the Belgæ.

These various vehicles were sometimes very splendidly ornamented with gold and precious stones; and covered

carriages seem more and more to have become appendages of Roman pomp and magnificence. Sumptuary laws were enacted on account of the public extravagance, but they were little regarded, and were altogether abrogated by the emperor Severus. Suetonius states that Nero took with him on his travels no less than a thousand carriages.

On the introduction of the feudal system the use of carriages was for some time prohibited, as tending to render the vassals less fit for military service. Men of all grades and professions rode on horses or mules, and sometimes the monks and women on she-asses. Horseback was the general mode of travelling; and hence the members of the council, who at the diet and on other occasions were employed as ambassadors, were called *ritmeister*. In this manner also great lords made their public entry into cities.

Covered carriages were known in the beginning of the 16th century, but their use was confined to ladies of the first rank; and as it was accounted a reproach for men to ride in them, the electors and princes sometimes excused their non-attendance at meetings of the state by the plea that their health would not permit them to ride on horseback.

Covered carriages were for a long time forbidden even to women; but about the end of the 15th century they began to be employed by the emperor, kings, and princes, in journeys, and afterwards on state occasions. In 1474 the Emperor Frederick III. visited Frankfort in a close carriage, and again in the following year in a very magnificent covered carriage. Shortly afterwards carriages began to be splendidly decorated; that, for instance, of the electress of Brandenburg at the tournament held at Ruppin in 1509 was gilded all over, and that of the duchess of Mecklenburg was hung with red satin. When Cardinal Dietrichstein made his entrance into Vienna in 1611, forty carriages went to meet him; and in the same year the consort of the Emperor Matthias made her public entrance on her marriage in a carriage covered with perfumed leather. The wedding carriage of the first wife of the Emperor Leopold, who was a Spanish princess, cost, together with the harness, 38,000 florins. Those of the emperor are thus described:

"In the imperial coaches no great magnificence was to be seen; they were covered over with red cloth and black mails. The harness was black, and in the whole work there was no gold. The panels were of glass, and on this account they were called the imperial glass coaches. On festivals the harness was ornamented with red silk fringes. The imperial coaches were distinguished only by their having leather traces; but the ladies in the imperial suite were obliged to be contented with carriages the traces of which were made of ropes." At the magnificent court of Duke Ernest Augustus at Hanover, in 1681, there were fifty gilt coaches with six horses each. The first time that ambassadors appeared in coaches on a public solemnity was at the imperial commission held at Erfurt in 1613. Soon after this time coaches became common all over Germany, notwithstanding various orders and admonitions to deter vassals from using them. These vehicles appear to have been of very rude construction. Beckmann describes a view he had seen of Bremen, painted by John Landwehr in 1661, in which was represented a long quadrangular carriage, apparently not suspended by straps, and covered with a canopy supported by four pillars, but without curtains. In the side was a small door, and in front a low seat or box; the coachman sat upon the horses; and the dress of the persons within proved them to be burgoinasters. At Paris in the 14th, 15th, and even 16th centuries, the French monarchs rode commonly on horses, the servants of the court on mules, and the princesses and principal ladies sometimes on asses. Persons even of the highest rank sometimes sat behind their equerry on the same horse. Carriages, however, were used at a very early period in France; for

there is still extant an ordinance of Philip the Fair, issued in 1294, by which citizens' wives are prohibited from using them. It appears, however, that about 1550 there were only three carriages at Paris,—one belonging to the queen, another to Diana of Poitiers, and the third to René de Laval, a very corpulent nobleman who was unable to ride on horseback. The coaches used in the time of Henry IV. were not suspended by straps (an improvement referred to the time of Louis XIV.), though they were provided with a canopy supported by four ornamental pillars, and with curtains of stuff or leather.

Occasional allusion is made to the use of some kinds of vehicles in England during the Middle Ages. In *The Squire of Low Degree*, a poem of a period anterior to Chaucer, a description of a sumptuous carriage occurs:

"To-morrow ye shall on hunting fare
And ride, my daughter, in a chare.
It shall be cover'd with velvet red,
And cloth of fine gold all about your head,
With damask white and azure blue
Well diaper'd with lilies new."

Chaucer himself describes a chare as

"With gold wrought and pierrie."

When Richard II. of England, towards the end of the 14th century, was obliged to fly before his rebellious subjects, he and all his followers were on horseback, while his mother alone used a carriage. The oldest carriages used in England were known as chares, cars, chariots, caroches, and whirlicotes; but these became less fashionable when Ann, the wife of Richard II., showed the English ladies how gracefully she could ride on the side-saddle. Stow, in his *Survey of London*, remarking, "so was riding in those whirlicotes and chariots forsaken except at coronations and such like spectacles." The same writer states that in the year 1564 Guiliam Booner, a Dutchman, became the queen's coachman, and was the first that brought the use of coaches into England. Although Stow is incorrect in thus attributing the introduction of coaches to the time of Elizabeth, there is no doubt that at the period he indicates, the use of wheeled vehicles began to be so common that it then became a prominent public fact. "Little by little," he again states, "they became usual among the nobilitie and others of sort, and within twenty years became a great trade of coachmaking." By the beginning of the 17th century the use of coaches had become so prevalent that in 1601 the attention of Parliament was drawn to the subject, and a Bill "to restrain the excessive use of coaches" was introduced, which, however, was rejected on the second reading. Their use told severely on the occupation of the Thames watermen, and Taylor the poet and waterman complained bitterly both in prose and verse against the new-fangled practice:—

"Carroaches, coaches, jades, and Flanders mares
Doe rob us of our shares, our wares, our fares.
Against the ground we stand and knock our heels,
Whilst all our profit runs away on wheels."

The sneers of wits and watermen notwithstanding, coaches became so common, that in the early part of the 17th century they were estimated to number more than 6000 in London and its surrounding country.

Vehicles plying for public convenience, we have seen, were in existence during the period of the Roman empire, and concurrently with the renewal of carriage locomotion in the 16th century, public carriages were again re-established. Hackney coaches were first introduced in France during the minority of Louis XIV. by one Nicolas Sauvage, who lived at the sign of Saint Fiacre in the Rue St Martin, and hence hired carriages came to be called *fiacres*, though eventually the name was restricted to such

as were stationed for hire in the streets. In 1650 Charles Villermé obtained the exclusive privilege of hiring out *fiacres* in Paris for a payment of 5000 livres. The prototype of the modern omnibus first commenced plying in the streets of Paris on the 18th March 1662, going at fixed hours, at a stated fare of five sous. Soldiers, lackeys, pages, and livery servants were forbidden to enter such conveyances, which were announced to be *pour la plus grande commodité et liberté des personnes de mérite*. In the time of Charles X. the omnibus system in reality was established; for no exclusion of any class or condition of person who tendered the proper fare was permitted in the vehicles then put on various routes, and the fact of the carriages being thus at the service of all gave rise to the present name.

Hackney coaches were first established in London in 1625. Writing in 1634 to Lord Stafford, Mr Garrard says,—“Here is one Captain Bailey; he hath been a sea captain, but now lives on the land, about this city, where he tries experiments. He hath erected, according to his ability, some four hackney-coaches, put his men in livery, and appointed them to stand at the May-pole in the Strand, giving them instructions at what rate to carry men into several parts of the town, where all day they may be had. Other hackney-men seeing this way, they flocked to the same place, and perform their journeys at the same rate, so that sometimes there is twenty of them together.”

In 1637 there were in London and Westminster no fewer than 50 such coaches; in 1652 they had increased to 200, and in 1654 to 300, employing 600 horses. In 1694 the number of hackney coaches was limited to 700, and in 1715 to 800. Thus, notwithstanding the competition of sedan chairs, the hackney-coach held its place and grew in importance till it was, about 1820, supplanted by the *cabriolet de place*, now shortened into “cab,” which had previously held a most important place in Paris. In that city the cabriolet came into great public favour about the middle of the 18th century, and in the year 1813 there were 1150 such vehicles plying in the Parisian streets. The original cabriolet was a kind of hooded gig, inside which the driver sat, besides whom there was only room left for a single passenger. Mr Hansom, the inventor whose name attaches to the London two-wheeled vehicle to the present day, patented his cab first in the year 1834. It consisted originally of a square body hung in the centre of a square frame, the two wheels being about 7 feet 6 inches in diameter, the same height as the vehicle. On this very numerous improvements were quickly made, and in 1836, after a fresh patent had been obtained in name of Messrs Gillett and Chapman, a company was formed for establishing hansom cabs essentially the same as now in use.

Of coaches possessing a history the two best known in the United Kingdom are Her Majesty's state coach, and that of the Lord Mayor of London. The latter is the oldest, having been built, or at least first used, for the procession of Sir Charles Asgill, Lord Mayor elect, in November 1757. The body of this wonderful vehicle is not supported by springs, but hung on leather straps; and the whole structure is very richly loaded with ornamental carving, gilding, and paint-work. The different panels and the doors contain various allegorical groups of figures representing suitable subjects and heraldic devices painted in a spirited manner. The royal state coach, which is described as “the most superb carriage ever built,” was designed by Sir William Chambers, the paintings on it were executed by Cipriani, and the work was completed in 1761. The following is an official description of it:—

“The whole of the carriage and body is richly ornamented with laurel and carved work, beautifully gilt. The length, 24 feet; width, 8 feet 3 inches; height, 12 feet; length of pole, 12 feet 4

inches; weight, 4 tons. The carriage and body of the coach is composed as follows:—Of four large Tritons, who support the body by four braces, covered with red morocco leather, and ornamented with gilt buckles, the two figures placed in front of the carriage bear the driver, and are represented in the action of drawing by cables extending round their shoulders, and the cranes and sounding shells to announce the approach of the monarch of the Ocean; and those at the back carry the imperial fasces, topped with tridents. The driver's foot-board is a large scallop shell, ornamented with bunches of reeds and other marine plants. The pole represents a bundle of lances; the splinter bar is composed of a rich moulding, issuing from beneath a voluted shell, and each end terminating in the head of a dolphin; and the wheels are imitated from those of the ancient triumphal chariot. The body of the coach is composed of eight palm-trees, which, branching out at the top, sustain the roof; and four angular trees are loaded with trophies allusive to the victories obtained by Great Britain, during the late glorious war, supported by four lions' heads. On the centre of the roof stand three boys, representing the genii of England, Scotland, and Ireland, supporting the imperial crown of Great Britain, and holding in their hands the sceptre, sword of state, and ensign of knighthood; their bodies are adorned with festoons of laurel, which fall from thence towards the four corners. The panels and doors are painted with appropriate emblematic devices, and the linings are of scarlet velvet richly embossed with national emblems.”

Modern Carriages.—The forms of carriages as now built are so numerous as almost to defy classification, and they altogether baffle detailed description. The climate, conditions of life, and various other circumstances of different countries have originated modified forms of carriage in each of them, some of which have come into general use, while others are seldom seen out of the land of their origin. Mr G. N. Hooper, of the firm of Hooper & Co. of London, who has given valuable assistance in the preparation of the present article, supplies the following table of modern carriages with the countries of their origin:—

Coach.	Kotze, Berlin.	Hungary or Prussia.
Chariot.	Compé.	France.
Barouche.	Calèche.	“
Britzka.	Britzka.	Austria.
Droski.	Droitzka.	Germany and Russia.
Cabriolet.	Cabriolet.	France.
Cab Phaeton.	Milord or Victoria.	England.
Mail Phaeton.	Mail phaeton.	“
Gig and Tilbury.	Tilbury.	“
Curricl.	Curricl.	Italy.
Landau.	Landau.	Germany.
Fourgon.	Fourgon.	France.
Dog-cart.	To-car.	England.
Omnibus.	Omnibus.	France (by Shillibeer, an Englishman).
Drag.	Malle-Anglaise.	England.
Park Phaeton.	Phaeton de parc.	“
Brougham.	Petit coupé.	“
Double Brougham.	Clarence.	(Lord Brougham).
Clarence.	Waggonette	England.
Waggonette.	Sociable.	“
Sociable.	T-cart.	“
T-cart.	“	“
Sociable-landau.	“	“
Basket carriage.	Panier-à-salade.	“
Britzka-chariot.	Eilwagen.	Germany.
Spider phaeton.	“	America.
Rockaway.	“	“
Char-à-côte.	“	Switzerland.
Tarantas.	Voiture de voyage.	Russia.
Kibitka.	“	“
Telega.	“	“
Troika.	“	“
Outside car on two or four wheels.	“	Ireland.
Sledge.	“	Russia, Norway, Germany, Canada, &c.
Carriole.	“	Norway.

In addition to this list there are numberless forms of fancy carriage, and the misdirected ingenuity of coach-builders is frequently exercised in the attempt to combine the features and advantages of several vehicles in one structure,

generally with the result of rendering it unfit to be used with comfort or safety in any form.

In comparing the carriages of the present day with those of earlier periods it should be borne in mind that many circumstances apart from the skill and invention of the coach-builder have combined to modify, or to necessitate the modification, of such structures. The condition of streets and roads was such, at no very remote date, as to permit of only the most cautious traffic within limited areas in vehicles of great strength, solidity, and weight. The paving of streets and macadamization of highways gave designers of carriages facilities for planning vehicles of a light, airy type on more elegant lines, of which opportunities they were not slow to take advantage. Again, previous to the introduction of railways, not only public coaches but private carriages had to be built with a view to afford accommodation for undertaking long journeys, which are now entirely performed by railway, and that circumstance also now enables the coach-builder to give primary attention to the comfort, gracefulness, and elegance of the vehicles he constructs. But after allowance is made for all such circumstances, there remains to coach-builders, and especially to those of Great Britain, a very large share of credit, for the inventive skill and ingenuity which has brought the modern carriage to that perfection of workmanship and artistic finish which it everywhere displays. To enumerate the improvements in coach-building, which have been effected chiefly in the present century, would demand a much greater space than can be devoted to this subject. It must suffice simply to point to the Collinge axle invented in 1792, now universally adopted, by means of which wheels require oiling only once in several months. The elliptic springs, upon which nearly all carriages are now mounted, were patented by Obadiah Elliott in 1804. A great many ingenious devices have also been adopted for facilitating the opening and closing of the head of landaus or such carriages as are made to be open or close at pleasure. And generally coach-building has enjoyed a full share of the advantages flowing from the improved mechanical devices and processes of modern times.

Coachmaking.—Coachmaking is a combination of crafts rarely united in one trade, embracing, as it does, work in such diverse materials as wood, iron, steel, brass, cloth, leather, ivory, hair, &c. A great division of labour and numerous highly skilled artisans are consequently employed in the various stages in the construction of a high-class carriage. The workmen include body-makers, who build up the part in which persons sit; carriage-makers, who make or fit together all the under parts of the vehicle on which the body rests; wheel-wrights, joiners, and fitters; trimmers, who fit up the inside of the carriage; and several classes of smiths for special work connected with the iron framing, axles, springs, &c. Painting is an important part of the business, those professing it being divided into body, carriage, and heraldry or ornamental painters; and after the painter comes the polisher who gives the final brilliant polish to the outside of the whole structure.

A very great deal in the coach-making business depends on the selection of materials. Ash is the kind of wood commonly used in the framework both of body and carriage; and the quality best suited for body-wood is that of a mild and free nature, while for the carriage the wood cannot be too strong or robust. Full-grown wood, of course, is best suited for both purposes, and the planks must be allowed to lie until they are properly seasoned, as is indeed most essential with all the wood used in the building of a carriage. After the framework is made, the lower part of the body is panelled up with the softest bay mahogany, plain and free from grain. The kinds of wood generally applied to coach-wheel making are elm or fustie for the naves, oak

for the spokes, and ash for the felloes; but beech felloes are often used, and it has been found by experience that beech, when the felloes are cut from the log shortly after it is felled, and kept until they become dry before being put upon wheels, answers admirably for this purpose. American hickory is also one of the best available woods for spokes as well as carriage poles; and a large trade is now conducted between Great Britain and the United States in the importation of American machine-made hickory wheels. Canadian black walnut has also come into use as a substitute for mahogany in panelling, and many other woods are available for special portions of carriages.

Formerly, in the making of coach-springs, nothing was used but German steel, which from its hardness was more apt to snap than the English steel now employed for that purpose. The latter combines with superior elasticity a strength that enables the spring-maker to fabricate his springs at least one-third lighter, while they stand equal fatigue. The iron mounting of coach-work requires the skill of experienced smiths; for, besides solidity, some degree of taste is requisite to form the shapes and sets of the different parts. No branch of coach-making contributes more to the elegance of the vehicle than that of the painter. His colours must be of the best quality in order to stand exposure in all weathers. The varnish used is copal, of which there are two kinds,—the finest for finishing the body, and the second for finishing the carriage. Between paints of different qualities and varnish, a well-finished carriage gets from twenty to twenty-four separate coats before it is finished. Between each coating of varnish colour and varnish the work is carefully rubbed smooth and flat with pumice or fine glass paper, and the final polish is attained by rubbing with the palm of the hand.

The growth and development of railway travelling, instead of checking the use of horse-drawn vehicles, or injuring the art of the coach-builder, has had a very powerful influence in the opposite direction. Railway travelling has caused an enormous increase in the use of cabs and other public vehicles, while increasing wealth has multiplied luxurious private carriages. The revival of the driving of four-horse drags, in imitation of the old stage coaches, between London and various suburban towns (one going to Brighton), which has taken place of late years, is deserving of note. These coaches were put on the road by members of several aristocratic clubs, not with a view to profit; their success, however, has been very great.

As a coach-making and coaching country, England has long held the foremost place. "The road," its coaches, and their drivers figure largely in the popular literature of the country, and the perfection of coach equipment has been an unailing source of national pride. British coach-builders still continue to hold, almost without dispute, the highest position in their craft; and that expensive luxury—a first-class London-built carriage—cannot, for honest workmanship, handsome lines, and beautiful finish, be excelled by any product of industry. (J. PA.)

CARRICKFERGUS, a maritime county of a town, and a co-extensive parliamentary borough of the same name, in the province of Ulster, in Ireland. It is enclosed by the county of Antrim, except on the S. where it is skirted by the Bay of Carrickfergus (Belfast Lough). It comprises an area of 16,702 acres, of which 129 are occupied by the town. The surface is in general hilly; Lough Mourne, a lake of about 90 acres in extent, is 556 feet above the level of the sea, and the highest mountain, Slieve True, which commands a magnificent prospect, attains an elevation of 1100 feet. The land near the sea-shore is an alluvial plain. The farms are small, except in the hilly district, where grazing is carried on. The chief crops are oats and potatoes, for which sea-weed, with lime and vegetable

matter, forms the manure; and the district has long been famous for the manufacture of cheese. The fisheries are valuable and extensive, and the oysters taken off the coast are highly prized for their size and flavour. At Duncrue, about a mile and a half from the town, on the property of the marquis of Downshire, rock-salt of remarkable purity and in large quantity is found in the Triassic sandstone.

According to ecclesiastical arrangement, this burghal county forms a single rectory in the diocese of Connor. The population numbered 8520 persons in 1851, and 9397 in 1871,—4280 males and 5117 females. The borough returns one member to parliament.

The town of Carrickfergus, from which the county and adjoining bay take their name, is $9\frac{1}{2}$ miles north-east of Belfast by rail. It stretches along the shore of Belfast Lough, is about one mile in length, and consists of the old or walled town in the centre, the Irish quarter on the west, and the Scotch quarter on the east,—the last being chiefly inhabited by fishermen, descendants from a colony driven by religious persecution from Galloway and Ayrshire about the year 1665. The town is irregularly built, and deficient in neatness. The principal building is the old castle, standing on a projecting rock, from which the town derives the name Carrick; it was formerly a place of much strength, and is still maintained as an arsenal, and mounted with heavy guns. The ancient donjon or keep, 90 feet in height, is still in good preservation. The parish church, an antiquated cruciform structure, was originally a chapel or oratory dependent on a Franciscan monastery. The entrance to a subterranean passage between the two establishments is still visible under the communion-table of the church. The jail, built on the site of the above-mentioned monastery, was formerly the county of Antrim prison. The court-house, which adjoins the jail, is a neat modern building. When Carrickfergus was the county town of Antrim (which it ceased to be in 1850), the assizes were held there. The town has some trade in domestic produce and in linen manufactures, there being several flax spinning-mills and a bleach-work in the immediate neighbourhood. Distilling is carried on in the town. Vessels of 100 tons burden can discharge at the pier, and there is a patent slip on the shore. The population of the municipal town was 3543 in 1851, and 4212 in 1871, with an excess at the latter date of 528 females. In 1871 567 were Catholics and 3645 Protestants, and of the latter 2056 were Presbyterians.

In the reign of Queen Elizabeth the town obtained a charter, and this was confirmed by James I., who added the privilege of sending two burgesses to the Irish parliament. The corporation, however, was superseded, under the provisions of the Municipal Reform Act of 1840, by a board of municipal commissioners. In 1152, John de Courcy, to whom Henry II. had granted all the parts of Ulster he could obtain possession of by the sword, fixed a colony in this district. De Courcy built the castle which afterwards came into possession of the De Lacy family, who, being ejected, invited Edward Bruce to besiege it (1315). After a desperate resistance the garrison surrendered. In 1386, the town was burned by the Scots, and in 1400 was destroyed by the combined Scots and Irish. Subsequently, it suffered much by famine and the occasional assaults of the neighbouring Irish chieftains, whose favour the townsmen were at length necessitated to secure by the payment of an annual tribute. In the reign of Charles I. many Scotch Covenanters settled in the neighbourhood to avoid the persecution directed against them. In the civil wars, from 1641, Carrickfergus was one of the chief places of refuge for the Protestants of the county of Antrim; and on July 10, 1642, the first Presbytery held in Ireland met there. In that year the garrison was commanded by General Munroe, who having afterwards relinquished the cause of the English Parliament, was, in 1648, surprised and taken prisoner by Sir Robert Adair. At a later period Carrickfergus was held by the partisans of James II., but surrendered in 1689 to the forces under King William's general Schomberg; and in 1690 it was visited by King William, who landed here on his expedition to Ireland. In 1760 it was surprised by a French squadron under Commodore Tlicurot, who landed with about 1000 men, and, after

holding the place for a few days, evacuated it on the approach of the English troops. Eighteen years later Paul Jones, in his ship the "Ranger," succeeded in capturing the "Drake," a British sloop-of-war, in the neighbouring bay; but he left without molesting the town.

CARRICK-ON-SUIR, a town of Ireland in the south riding of the county of Tipperary, province of Munster, is situated on the Suir, 14 miles east of Clonmel, with a station on the Waterford and Limerick railway. It was formerly a walled town, and contains some very ancient buildings, such as the parish church and the castle, erected in 1309, which belongs to the Butler family. On the other side of the river, but connected by a bridge of the 14th century, stands the suburb of Carrickbeg, with an abbey founded in 1336. The woollen manufactures for which the town was formerly famous still give employment to about 400 people; and upwards of 1000 are at work in the linen and flax factories. A thriving export trade is carried on in agricultural produce, and slate is extensively quarried in the neighbourhood. Carrick-on-Suir became a place of importance soon after the English conquest of Ireland, and it still gives the title of earl to a branch of the Butler family. Population in 1871, 7792.

CARRIER, in its general acceptation, is a person who conveys the goods of another for hire. In its mere colloquial use it was applied to the class of men, now rendered comparatively obsolete by the railway system, who conveyed goods in carts or waggons on the public roads. In jurisprudence, however, the term is collectively applied to all conveyers of property, whether by land or water; and in this sense the late changes and enlargements of the system of transit throughout the world have given additional importance to the subject. The law by which carriers, both by land and sea, are made responsible for the goods intrusted to them, is founded on the prætorian edict of the civil law, to which the ninth title of the fourth book of the Pandect is devoted. The edict itself is contained in these few words, "*nautæ, caupones, stabularii, quod cujusque saluum fore receperint, nisi restituent, in eos iudicium dabo.*" The beautiful simplicity of the rule so announced has had a most beneficial influence on the commerce of the world. Throughout the great civilized region which took its law directly from the Roman fountain, and through the other less civilized countries which followed the same commercial code, it laid a foundation for the principle that the carrier's engagement to the public is a contract of indemnity. It bound him, in the general case, to deliver what he had been entrusted with, or its value,—thus sweeping away all secondary questions or discussions as to the conditions of more or less culpability on his part under which loss or damage may have occurred; and it left any limitations of this general responsibility to be separately adjusted by special contract.

The law of England recognizes a distinction between a common and a private carrier. The former is one who holds himself out to the public as ready to carry for hire from place to place the goods of such persons as choose to employ him. The owner of a stage coach, a railway company, the master of a general ship, a wharfinger carrying goods on his own lighters are common carriers; and it makes no difference that one of the *termini* of the journey is out of England. It has been held, however, that a person who carries only passengers is not a common carrier; nor of course is a person who merely engages to carry the goods of particular individuals. If a man undertakes to carry goods safely, although he is not a common carrier, and is to have nothing for the carriage, he is responsible for damage sustained by his negligence. A common carrier is subject at law to peculiar liabilities. He is bound to carry the goods of any person who offers to pay his hire, unless there is a good reason to the contrary,

as, for example, when his carriage is full, or the article is not such as he is in the habit of conveying. He ought to carry the goods in the usual course without unnecessary deviation or delay. To make him liable there must be a due delivery of the goods to him in the known course of his business. His charge must be reasonable; and he must not give undue preference to any customer or class of customers. The latter principle, as enforced by statute, has come to be of great importance in the law of railway companies. In respect of goods entrusted to him, the carrier's liability, unless limited by a special contract, is, as already stated, that of an insurer. There is no question of negligence as in the case of injury to passengers, for the warranty is simply to carry safely and securely. The law, however, excepts losses or injuries occasioned immediately "by the act of God or the king's enemies"—words which have long had a strict technical signification. It would appear that concealment without fraud, on the part of the customer, will relieve the carrier from his liability for *negligence*, but not for actual *misfeasance*. Fraud or deceit by the customer (e.g., in misrepresenting the real value of the goods) will relieve the carrier from his liability. The responsibility of the carrier ceases only with the delivery of the goods to the proper consignee. By the Carrier's Act (11 Geo. IV. and 1 Will. IV. c. 68) the liability of carriers for gold, silver, &c. (in general "articles of great value in small compass") is determined. Should the article or parcel exceed £10 in value, the carrier is not to be liable for loss unless such value is declared by the customer, and the carrier's increased charge paid. Where the value is thus declared, the carrier may, by public notice, demand an increased charge, for which he must, if required, sign a receipt. Failing such receipt or notice, the carrier must refund the increased charge and remain liable as at common law. Except as above no mere notice or declaration shall affect a carrier's liability; but he may make special contracts with his customers. The carriage of goods by railway or canal or by sea is subject to special regulations. (See RAILWAYS and CHARTER PARTY.) A carrier of passengers is responsible for personal injuries only when they have been occasioned by his negligence or want of skill. Where there has been contributory negligence on the part of the plaintiff,—i.e., where he might, by the exercise of ordinary care have avoided the consequences of the defendant's negligence—he is not entitled to recover. By 9 and 10 Vict. c. 93 (commonly called Lord Campbell's Act), when a person's death has been caused by such negligence as would have entitled him to an action had he survived, an action may now be maintained against the party responsible for the negligence on behalf of the wife, husband, parent, or child of the deceased. Previously such cases had been governed by the maxim *actio personalis moritur cum persona*.

CARRIER, JEAN BAPTISTE (1756–1794), French Revolutionist, one of the actors most infamous for cruelty in the "Reign of Terror," was born at Yolai, a village near Aurillac in Upper Auvergne, in 1756. At the beginning of the Revolution (1789), he was merely an obscure attorney; and in 1792, with many others of the same class, he was chosen deputy to the National Convention. He was already known as one of the influential members of the Cordeliers Club, which with the Jacobins supported Robespierre. After the subjugation of Flanders he was one of the commissioners nominated in the close of 1792 by the Convention, and sent into that country to carry out a general spoliation of the inhabitants, which was called "organizing the progress of liberty." In the following year he took part in establishing the revolutionary tribunal, and said openly that for the prosperity of the republic at least half of its population must be "suppressed." He voted for

the death of Louis XVI., was one of the first to call for the arrest of the duke of Orleans, and took a prominent part in the revolution of May 31 (overthrow of the Girondists). After a mission into Normandy, Carrier was sent, early in October 1793, to Nantes, under orders from the Convention to suppress the revolt which was raging there, by the most severe measures. Nothing loath, he established a revolutionary tribunal, and formed a body of desperate men, called the Legion of Marat, for the purpose of destroying in the swiftest way the masses of prisoners heaped together in the jails. The form of trial was soon discontinued, and the victims were sent to the guillotine or shot or cut down in the prisons *en masse*. He also had large numbers of prisoners put on board a vessel with a trap door in its bottom, and sunk in the Loire by night. This process, first of the *noyades* of Nantes, called by its inventor "republican baptism," was twenty-five times repeated, so that the river became polluted with corpses, and a decree was issued, prohibiting the drinking of its water; and even in this wholesale slaughter of men, women, and little children, there were special aggravations. Such was the terror inspired by these deeds that for some time no one dared to denounce the perpetrator, who, in his reports to the Committee of Public Safety, deliberately lied. At length the horrible truth became known, and Carrier was recalled. He was now the object of general execration; and although, in consequence of the fall of Robespierre (9th Thermidor), he had a short respite, he was in November 1794 tried before the revolutionary tribunal. The proceedings lasted nearly a month, and on the 16th December, having vainly pleaded the orders of the Convention in his defence, he was condemned to death and executed.

CARRON, a small village of Scotland, in the county of Stirling and parish of Larbert, on the right bank of the Carron River, about two miles north-east of Falkirk. It is of importance for its iron-works, which were started in 1760 by a chartered company, with a capital of £150,000. There are five blast-furnaces and thirty-five bloomery forges, and they give employment to upwards of 2000 individuals. The carronade, a short kind of cannon with a large chamber for the powder, is so called because it was first made in perfection at these works. The river, which falls into the Forth three miles E.N.E. of Falkirk, is interesting as at one time the boundary of the Roman empire on the north-west. In the neighbourhood, are the ruins of the ancient Camelon, and not far from the iron-works is the site of a now demolished monument of great antiquity known as Arthur's Oven, or Oon. The population is about 2500.

CARSTARES, WILLIAM (1649–1715), a Scottish clergyman, born at Cathcart, near Glasgow, on the 11th February 1649, was the son of the Rev. John Carstares, a member of the extreme Covenanting party of Protestors. He was educated at the university of Edinburgh, and then passed over to Utrecht, where he commenced his life-long friendship with the prince of Orange, and began to take an active part in the politics of his country. At this time the state of Scotland was restless and unhappy in the extreme; and it was natural, therefore, that the Government should desire to silence Carstares, whom it had several reasons to dislike. He was the intimate of William; he had been the bearer of messages between the disaffected in Scotland and Holland; and he was believed to be concerned with the learned James Steuart in the authorship of a severe pamphlet—*An Account of Scotland's Grievances by reason of the D. of Lauderdale's Ministrie, humbly tendered to his Sacred Majesty*. Accordingly, on his return to England, at the close of 1674, he was committed to the Tower; the following year he was transferred to Edinburgh Castle, and it was not till August 1679 that he was released. After this he visited Ireland, and then became

pastor to a Nonconformist congregation at Cheshunt. During 1682 he was in Holland, but in the following year he was again in London, and was implicated in the Rye House Plot. On its discovery he was examined before the Scottish Council; but, though the torture of the thumb-screw was applied, he refused to utter a word till he was assured that his admissions would not be used in evidence, and in the disclosures he then made he displayed great discretion. On his return to Holland he was rewarded by William's still warmer friendship, and the post of court chaplain; and after the Revolution he continued to hold this office, under the title of royal chaplain for Scotland. He was the confidential adviser of the king, especially with regard to the affairs of his native country, and rendered important service to Presbyterianism, in promoting the Revolution Settlement.

At the accession of Anne, Carstares retained his post as royal chaplain, but resided in Edinburgh, having been elected principal of the University. He was also minister of Greyfriars, and afterwards of St Giles, and was four times chosen moderator of the General Assembly. He took an important part, too, in promoting the Union, and was consulted by Harley and other leading Englishmen concerning it. During Anne's reign, the chief object of his policy was to frustrate the measures which were planned by Lord Oxford to strengthen the Episcopalian Jacobites, especially a Bill for extending the privileges of the Episcopalian, and the Bill for replacing in the hands of the old patrons the right of patronage, which by the Revolution Settlement had been vested in the elders and the Protestant heritors.

On the accession of George I. Carstares was appointed, with five others, to welcome the new dynasty in the name of the Scottish Church. He was received graciously and with hearty thanks for his services, and the office of royal chaplain was again conferred upon him. A few months after he was struck with apoplexy, and died on the 28th of December 1715.

See *State-papers and Letters addressed to William Carstares*, to which is prefixed a Life by M'Cormick, 1774; and *Story's Character and Career of William Carstares*, 1874.

CARTAGENA, or CARTHAGENA, a fortified seaport of Spain on the Mediterranean Sea, in the province of Murcia, and 29 miles S. by E. of the town of that name, in 37° 36' N. lat. and 1° W. long. The town stands on a hill separated by a little plain from the harbour; towards the N. and E. it communicates with a fertile valley; on the S. and W. it is hemmed in by high mountains. The harbour, the finest on the eastern coast of Spain, is fringed by four hills; and the island called La Escombrera, the ancient *Scombraria*, 2½ miles from the narrow entrance, shelters it from the violence of wind and waves. The harbour is heart-shaped and deep, except near its centre, where there is a ledge of rocks only 5 feet under water. On the eastern side is a breakwater 842 yards in length. A tramway leads from the port to the centre of the mining district, a distance of about two leagues. The streets of the town are spacious, but not imposing; and the friability of the stone gives the houses a dilapidated look. The barracks, arsenal, wet and dry docks, marine school, parade, rope-walks, and the fortifications, are all in a neglected condition. The mines near the town are very productive, and thousands of men and beasts are employed in transporting ores of lead, iron, copper, zinc, and sulphur to the coast. In 1871 there were 150 blast-furnaces and 76 smelting furnaces at work. The profits vary according to the prices of English coal and coke. Among other mineral products of Cartagena may be mentioned gypsum, saltpetre, amethysts, and rubies. Barley and wheat are grown in fair quantity, and there are some extensive vineyards and olive yards. Esparto grass (*Stipa tenacissima*), a species of rush,

now much used in paper manufacture, is largely grown in the neighbourhood. It is the *spartum*, or Spanish broom, of the ancient Romans,—whence their name for Cartagena, *Carthago Spartaria*. It is still used locally for making shoes, ship's cables, mats, and a kind of spun cloth. Barilla, earthenware, glass, and silk are also among the manufactures of Cartagena. The former prevalence of fever, the abandonment of the arsenal, and the prosperity of the neighbouring port of Alicante have much affected the trade of the town during this century; the rail-road communication which now exists with Murcia promises, however, to bring about a revival of its commerce. The imports are chiefly coal and coke from Wales and the north of England. The principal exports are esparto grass and metallic ores; 195,000 tons of the latter were shipped in 1872, almost wholly to Great Britain. The British vessels cleared in 1872 were 244, tonnage 113,015. Of foreign vessels 413 were cleared, tonnage 184,933. The sanitary condition of the town is now greatly improved, as the Almaraz Marsh, which formerly caused much intermittent fever, has been drained. The drinking-water of Cartagena is not good; house-rent and food, with the exception of bread-stuffs, are dear; and there are many paupers and mendicants, to whom no public relief is afforded. The population in 1872 was estimated at 26,000, exclusive of the miners and the labourers in the works of the port.

Cartagena was founded about the year 243 B.C. by Hasdrubal, and was called *Carthago Nova* or New Carthage, to distinguish it from the African city of Carthage. It was conveniently situated opposite to the Carthaginian territory in Africa, and was early noted for its harbour, the best on the neighbouring coast of Spain. Its silver and gold mines were the source of great wealth both to the Carthaginians and to the Romans. In 210 B.C. this important place, the headquarters and treasure city of the Punic army, was stormed and taken with great slaughter by P. Scipio. The city continued to flourish under the Romans, who made it a colony, with the name *Colonia Victrix Julia Nova Carthago*. In 425 A.D. it was pillaged and nearly destroyed by the Goths. The modern Cartagena was a bishopric till the year 1219, when the see was removed to Murcia. It was rebuilt by Philip II. of Spain, for the sake of its harbour. In 1706, in the war of the Spanish Succession, it was occupied by Sir John Leake; and in the next year it was retaken by the duke of Berwick. On the 5th November 1823 the town capitulated to the French. In consequence of the insurrection in Spain, Cartagena was in 1844 again the scene of warfare. On the 23d August 1873 it was bombarded by the Spanish fleet under Admiral Lobos; on the 11th October a battle took place off the town, between the ships of the Government and the *Intransigentes*, and on the 12th January 1874 Cartagena was occupied by the Government troops.

CARTAGENA, or CARTHAGENA, a seaport town on the northern coast of South America, in the United States of Colombia, in 10° 25' 48" lat. and 75° 34' W. long. It is situated on a low sandy island, which, with the island south of it, Tierra Bomba, forms the harbour of Cartagena. To the east of the town, and connected with it and the mainland by bridges, is the suburb of Xiximani, on another island. The houses of Cartagena are of stone, with lattices and balconies of wood, and are regularly built, but mostly only one story high. The streets are well-paved, but dark and narrow; arrangements have lately been made for lighting them by petroleum gas. The principal buildings are the fortresses, some convents and churches, and the public hospitals. The town possesses a park and a theatre. The large cisterns in the walls contain a supply of excellent water. The mean temperature of Cartagena is about 83° Fahr. In the summer the heat is excessive, and yellow fever often commits great ravages; leprosy, also, is not unfrequent. The harbour, which is second to none on the north coast of South America, covers 40,000 acres; it affords complete security to ships in all weathers, and great facilities for loading and unloading. It is divided into three sections, Boca Grande and Pascaballos, and the Caldera, which have a depth of about 15 fathoms; and Boca Chica, which is deeper. The entrance to Boca Chica

is defended by the two forts—Angelo and San Fernando. Its narrowness, the shallows at its mouth, and the irregularity of the tides render a pilot necessary for ships passing through it. The roadstead for large vessels is about three miles from the city. A chain of salt-lakes, which open into the Bay of Cartagena to the S.W., and extend towards the Magdalena, in a valley through which that river may at one time have flowed, was taken advantage of by the Spaniards in former times for the construction of a canal. Very little cutting seems to have been necessary, except at Calamar, the point of junction with the river. During the War of Independence the old channel became choked up; it was reopened, however, in 1846, after which the flooding of the valley rendered the channel once more unnavigable, except for barges of light draught. On account of the closing of the Digue, the rival port of Barranguilla has been created, and a great amount of commerce has been transferred to Santa Martha. The rapidly-increasing requirements of trade in Colombia, and the great superiority of Cartagena as a shipping depôt, cannot fail, however, of securing before long the reopening of the route by the Digue. The imports of Cartagena from the United Kingdom are cotton goods, linen and woollen cloth, crockery-ware, glass, cutlery and hardware. The exports are sugar, tobacco, coffee, cotton, dividivi and dye woods, ivory-nuts, balsam of Tolu, caoutchouc, cocoa-nuts and fibre, and hides. Most of the cotton is obtained from wild plants, and the export is falling off year by year, as is also that of caoutchouc, from the wasteful cutting down of the india-rubber trees. The cultivation of sugar bids fair to succeed, for the climate and rich soil are adapted for the growth of the cane. The difficulty of obtaining labour has hitherto been a clog on agricultural enterprise in Cartagena. The value of bullion exported from Cartagena on British account in the year ending August 31, 1873, was £6237. The value of the imports was £153,160; the customs revenues, £41,400. There are no duties on exports. The number of vessels which entered the port in 1873 was 50, tonnage 30,637. The population of Cartagena, formerly estimated at 28,000, is now about 9000 only; four-fifths of these are black or coloured people. The town of Cartagena is the chief naval arsenal of New Granada. It was founded in 1533 by Pedro de Heredia; in 1544 it was seized by the French; it was taken in 1585 by Sir Francis Drake, and in 1697 by the French, who obtained from it over a million of money. In 1741 Vernon unsuccessfully besieged the town. It was taken by Bolivar in 1815, and surrendered to the royalists in the same year. Finally, it was captured by the republicans, September 25, 1821.

CARTAGO, an inland town of Costa-Rica, Central America, on a river of the same name, 60 miles from the Gulf of Nicoya. The town suffered severely from an earthquake in 1811, and has since then decreased in commercial importance, while the population has been reduced from about 9000 to 3000 inhabitants. The volcano Cartago, near the town, is 11,480 feet high.

CARTAGO, an inland city of the state of Cauca, in the United States of Colombia, South America, 130 miles north-west of Bogota, and situated on the Viega, an affluent of the Cauca. The inhabitants, numbering about 8000, carry on a considerable trade in horned cattle, fruits, coffee, cocoa, and tobacco. The climate is dry and salubrious, and the surrounding country well cultivated.

CARTE, THOMAS (1686-1754), an English historian, was born at Dunsmon, near Clifton, in 1686. He was educated at Oxford, and was first brought into public notice by his controversy with Dr Chandler regarding the Irish massacre, in which he defended Charles I. His attachment to the Stuarts also caused him to remain a non-juror, and on the discovery of the plot of Atterbury, whose

secretary he was, he was forced to flee to France. During his residence in that country he collected materials for an English edition of De Thon and Rigault. These papers were purchased by Dr Mead, under whose direction the book was published in a very handsome form. Being recalled to England through the influence of Queen Caroline, he published, in 1738, *A General Account of the Necessary Materials for a History of England*. The task of collecting these materials he undertook, with the assistance of subscriptions from various sources. The first volume of his history, which is only of value for its vast and careful collection of facts, was published in 1744. By the insertion in it of the statement that the king's evil had been cured by the Pretender, Carte forfeited the favour of most of his patrons. He, however, continued to publish; and the 2d volume appeared in 1750, the 3d in 1752, the 4th in 1755. His papers became the property of the University of Oxford, and were deposited in the Bodleian Library.

CARTER, ELIZABETH (1717-1806), a celebrated lady scholar, and translator of the works of Epictetus, was the daughter of the Rev. Dr Carter of Deal in Kent, and was born in that town, December 16, 1717. Her mother, Margaret Swayne of Bere, in Dorset, lost her fortune by investing it in the South Sea Stocks, and died of a decline when Elizabeth was about ten years old. Dr Carter educated his children, boys and girls alike; but Elizabeth's slowness of apprehension tired out his patience, and it was only by great perseverance that she conquered her natural incapacity for learning. She studied late at night and early in the morning, taking snuff and chewing green tea to keep herself awake; and she so injured her health by this that she suffered throughout her life from severe headaches. Miss Carter learned Greek and Latin from her father, and was specially proficient in Greek, so that Dr Johnson said concerning a celebrated scholar, that he "understood Greek better than any one whom he had ever known except Elizabeth Carter." She learned also Hebrew, French, German, Italian, Spanish, Portuguese, and lastly some Arabic. She studied astronomy, ancient geography, and ancient and modern history. In 1734 some of her verses appeared in the *Gentleman's Magazine* under the signature "Eliza," Carr the editor being a friend of her father. In 1738 she published a small collection of poems, and next year she translated from the French an attack on Pope's *Essay on Man* by M. Crousaz. In 1739 appeared her translation from the Italian of Algarotti's *Newtonianismo per le Dame*, calling it *Sir Isaac Newton's Philosophy explained for the use of the Ladies, in six Dialogues on Light and Colours*. Her translation of Epictetus was undertaken in 1749 to please her friends Dr Sæcker (afterwards archbishop of Canterbury) and Miss Talbot, to whom the translation was sent, sheet by sheet, as it was done. This work was published by guinea subscription in 1758. In 1762 Miss Carter printed a second collection of poems. Dr Carter, from 1762 to his death in 1774, lived with his daughter in a house at Deal, which she had purchased. Her literary earnings were augmented by an annuity settled on her in 1761 by Sir William Pulteney and his wife, who had inherited the fortune of her old friend Lord Bath; and she had another annuity from Mrs Montagu after that lady had become a widow. Among Miss Carter's friends and correspondents may be mentioned—Johnson (whom she came to know through Cave the bookseller in 1737, and who printed one or two of her papers in the *Rambler*), Bishop Butler, Savage, Horace Walpole, Richardson, Reynolds, Burke, Mrs Montagu, Hannah More, and Mrs Vesey, the hostess of the *Bas-Bleus*. Miss Carter never married, and lived to the age of eighty-nine. She died in Clarges Street, Piccadilly, 1806; and her nephew, the Rev. Montagu Pennington, published her *Memoirs* in 1808.

CARTESIANISM

BY Cartesianism is here meant the philosophy developed principally in the works of Des Cartes, Malebranche, and Spinoza. It is impossible to exhibit the full meaning of these authors except in connection, for they are all ruled by one and the same thought in different stages of its evolution. It may be true that Malebranche and Spinoza were prepared, the former by the study of Augustine, the latter by the study of Jewish philosophy, to draw from Cartesian principles consequences which Des Cartes never anticipated. But the foreign light did not alter the picture on which it was cast, but only let it be seen more clearly. The consequences were legitimately drawn. It may be shown that they lay in the system from the first, and that they were evolved by nothing but its own immanent dialectic. At the same time it is not likely that they would ever have been brought into such clear consciousness, or expressed with such consistency, except by a philosopher whose circumstances and character had completely detached him from all the convictions and prejudices of the age. In Malebranche, Cartesianism found an interpreter whose meditative spirit was fostered by the cloister, but whose speculative boldness was restrained by the traditions of the Catholic church. In Spinoza it found one who was in spirit and position more completely isolated than any monk, who was removed from the influence of the religious as well as the secular world of his time, and who in his solitude seemed scarcely ever to hear any voice but the voice of philosophy. It is because Cartesianism found such a pure organ of expression that its development is, in some sense, complete and typical. Its principles have been carried to their ultimate result, and we have before us all the data necessary to determine their value.

DES CARTES was, in the full sense of the word, a partaker of the modern spirit. He was equally moved by the tendencies that produced the Reformation, and the tendencies that produced the revival of letters and science. Like Erasmus and Bacon, he sought to escape from a transcendent and unreal philosophy of the other world, to the knowledge of man, and the world he lives in. But like Luther, he found within human experience, among the matters nearest to man, the consciousness of God, and therefore his renunciation of scholasticism did not end either in materialism, or in that absolute distinction between faith and reason which inevitably leads to the downfall of faith. What was peculiar to Des Cartes, however, was the speculative interest which made it impossible for him to rest in mere experience, whether of things spiritual or things secular, which made him search, both in our consciousness of God and our consciousness of the world, for the links by which they are bound to the consciousness of self. In both cases it is his aim to go back to the beginning, to retrace the unconscious process by which the world of experience was built up, to discover the hidden logic that connects the different parts of the structure of belief, to substitute a reasoned system, all whose elements are interdependent, for an unreasoned congeries of opinions. Hence his first step involves reflection, doubt, and abstraction. Turning the eye of reason upon itself, he tries to measure the value of that collection of beliefs of which he finds himself possessed; and the first thing that reflection seems to discover is its accidental and unconnected character. It is a mass of incongruous materials, accumulated without system and untested. Its elements have been put together under all kinds of influences, without any conscious intellectual process, and therefore we can have no assurance of them. In order that we may have

such assurance we must unweave the web of experience and thought which we have woven in our sleep, that we may begin again at the beginning and weave it over again with "clear and distinct" consciousness of what we are doing. *De omnibus dubitandum est.* We must free ourselves by one decisive effort from the weight of custom, prejudice, and tradition with which our consciousness of the world has been overlaid, that in that consciousness in its simplest and most elementary form we may find the true beginning of knowledge. The method of doubt is at the same time a method of abstraction, by which Des Cartes rises above the thought of the particular objects of knowledge, in order that he may find the primary truth in which lies the very definition of knowledge, or the reason why anything can be said to be true. First disappears the whole mass of dogmas and opinions as to God and man which are confessedly received on mere authority. Then the supposed evidence of sense is rejected, for external reality is not immediately given in sensation. It is acknowledged by all that the senses often mislead us as to the nature of things without us; and perhaps they may also mislead us as to there being anything without us at all. Nay, by a stretch of effort, we can even carry doubt beyond this point, we can doubt even mathematical truth. When, indeed, we have our thoughts directed to the geometrical demonstration, when the steps of the process are immediately before our minds, we cannot but assent to the proposition that the angles of a triangle are equal to two right angles; but when we forget or turn away our thoughts from such demonstration, we can imagine that God or some powerful spirit is playing upon our minds to deceive them, so that even our most certain judgments may be illusory. In this naive manner does Des Cartes express the idea that there are necessities of thought prior to, and presupposed in the truth of geometry. He is seeking to strip thought of all the "lendings" that seem to come to it from anything but itself, of all relation to being that can be supposed to be given to it from without, that he may discover the primary unity of thought and being on which all knowledge depends. And this he finds in pure self-consciousness. Whatever I abstract from, I cannot abstract from self, from the "I think" that, as Kant puts it, accompanies all our ideas; for it was in fact the very independence of this universal element on the particulars that made all our previous abstraction possible. Even doubt rests on certitude; alone with self I cannot get rid of this self. By an effort of thought I separate my thinking self from all that I think, but the thinking self remains, and in thinking I am. *Cogito ergo sum.* The objective judgment of self-consciousness is bound up with or involved in the very faculty of judging, and therefore remains when we abstract from all other objective judgments. It is an assertion involved in the very process by which we dismiss all other assertions. Have we not then a right to regard it as a primitive unity of thought and being, in which is contained, or out of which may be developed, the very definition of truth?

The sense in which Des Cartes understood his first principle becomes clearer when we look at his answers to the objections made against it. On the one hand it was challenged by those who asked, like Gassendi, why the argument should be based especially on thought, and why we might not say with as good a right *ambulo ergo sum.* Des Cartes explains that it is only as referred to consciousness that walking is an evidence of my existence; but if I say "I am conscious of walking, therefore I exist," this is

equivalent to saying, "I think in one particular way, therefore I exist." But it is not thinking in a particular way, but thinking in general that is co-extensive with my existence. I am not always conscious of walking, or of any other special state or object, but I am always conscious, for except in consciousness there is no ego or self, and where there is consciousness there is always an ego. Do I then always think, even in sleep, asks the objector; and Des Cartes exposes himself to the criticisms of Loeko, by maintaining that it is impossible that there should ever be an interval in the activity of consciousness, and by insisting that as man is essentially a thinking substance, the child thinks, or is self-conscious, even in its mother's womb. The child disappears when we observe that the question as to the conditions under which self-consciousness is developed in the individual human subject, does not affect the nature of self-consciousness in itself, or in its relation to knowledge. The force of Des Cartes's argument really lies in this, that the world as an intelligible world exists only for a conscious self, and that therefore the unity of thought and being in self-consciousness is presupposed in all knowledge. Of this self it is true to say that it exists only as it thinks, and that it thinks always. *Cogito ergo sum* is, as Des Cartes points out, not a syllogism, but the expression of an identity which is discerned by the simple intuition of the mind.¹ If it were otherwise, the major "*omne quod cogitat existit*" would require to have been known before the minor "*cogito*"; whereas on the contrary it is from the immediate consciousness of being as contained in self-consciousness that that major can alone be derived. Again, when Hobbes and others argued that thinking is or may be a property of a material substance, Des Cartes answers that the question whether the material and the thinking substance are one does not meet us at the outset, but can only be solved after we have considered what is involved in the conception of these different substances respectively.² In other words, to begin by treating thinking as a quality of a material substance, is to go outside of the intelligible world for an explanation of the intelligible world. It is to ask for something prior to that which is first in thought. If it be true that the consciousness of self is that from which we cannot abstract, that which is involved in the knowledge of anything, then to go beyond it and seek for a reason or explanation of it in anything else is to go beyond the beginning of knowledge; it is to ask for a knowledge before knowledge.

Des Cartes, however, is himself unfaithful to this point of view; for, strictly taken, it would involve the consequence, not only that there is nothing prior to the pure consciousness of self, but that there can be no object which is not in necessary relation to it. Hence there can be no absolute opposition between thought and anything else, no opposition which thought itself does not transcend. But Des Cartes commits the error of making thought the property of a substance, a *res cogitans*, which as such can immediately or directly apprehend nothing but thoughts or ideas; while, altogether outside of these thoughts and ideas, there is another substance characterized by the property of extension, and with which thought has nothing to do. Matter in space is thus changed, in Kantian language, into a "thing in itself," an object out of all relation to the subject; and on the other hand, mind seems to be shut up in the magic circle of its own ideas, without any capacity of breaking through the circle or apprehending any reality but itself. Between thought and being, in spite of their subjective unity in self-consciousness, a great gulf seems still to be fixed, which cannot be crossed unless thought should

become extended, or matter think. But to Des Cartes the dualism is absolute, because it is a presupposition with which he starts. Mind cannot go out of itself, cannot deal with anything but thought, without ceasing to be mind; and matter must cease to be matter ere it can lose its absolute externality, its nature as having *partes extra partes*, and acquire the unity of mind. They are opposed as the divisible and the indivisible, and there is no possible existence of matter in thought except a representative existence. The ideal (or, as Des Cartes calls it, objective) existence of matter in thought and the real (or, as Des Cartes calls it, formal) existence of matter out of thought are absolutely different and independent things.

It was, however, impossible for Des Cartes to be content with a subjective idealism that confined all knowledge to the tautological expression of self-consciousness "I am I," "What I perceive I perceive." If the individual is to find in his self-consciousness the principle of all knowledge, there must be something in it which transcends the distinction of self and not self, which carries him beyond the limit of his own individuality. What then is the point where the subjective consciousness passes out into the objective, from which it seemed at first absolutely excluded? Des Cartes answers that it is through the connection of the consciousness of self with the consciousness of God. It is because we find God in our minds that we find anything else. The proof of God's existence is therefore the hinge on which the whole Cartesian philosophy turns, and it is necessary to examine the nature of it somewhat closely.

Des Cartes, in the first place, tries to extract a criterion of truth out of the *cogito ergo sum*. Why am I assured of my own existence? It is because the conception of existence is at once and immediately involved in the consciousness of self. I can logically distinguish the two elements, but I cannot separate them; whenever I clearly and distinctly conceive the one, I am forced to think the other along with it. But this gives me a rule for all judgments whatever, a principle which is related to the *cogito ergo sum* as the formal to the material principle of knowledge. Whatever we cannot separate from the clear and distinct conception of anything, necessarily belongs to it in reality; and on the other hand, whatever we can separate from the clear and distinct conception of anything, does not necessarily belong to it in reality. Let us therefore set an object clearly before us, let us sever it in thought so far as is possible from all other objects, and we shall at once be able to determine what properties and relations are essential, and what are not essential to it. And if we find empirically that any object manifests a property or relation not involved in the clear and distinct conception of it, we can say with certainty that such property or relation does not belong to it except by arbitrary arrangement, or, in other words, by the external combination of things which in their own nature have no affinity or connection.

Now, by the application of this principle, we might at once assure ourselves of many mathematical truths; but, as has been already shown, there is a point of view from which we may doubt even these, so long as the idea of a God that deceives us is not excluded. If it is not certain that there is a God that cannot lie, it is not certain that there is an objective matter in space to which mathematical truth applies. But the existence of God may be proved in two ways. In the first place it may be proved through the principle of causality, which is a self-evident truth. We have in our mind many ideas, and according to the principle of causality, all these ideas must be derived from something that contains a "formal" reality which corresponds to their "objective" reality, i.e., which contains at least as much reality in its existence out of thought as they contain in

¹ *Resp. ad secundas objectiones*, p. 74,—quoting from the Elzevir edition.

² *Resp. ad tertias obiect.*, p. 94.

their existence in thought. Now we might derive from ourselves not only the ideas of other minds like ourselves, but possibly also of material objects, since these are lower in the scale of existence than ourselves, and it is conceivable that the idea of them might be got by omitting some of the qualities which distinguish ourselves. But the idea of God, of a being who is eternal and immutable, all powerful, all wise, and all good, cannot be derived from our own limited and imperfect existence. The origin, therefore, must be sought in a being who contains actually in himself all that is contained in our idea of him.

To this argument it was objected by some of the critics of Des Cartes that the idea of God as the infinite Being is merely negative, and that it is derived from the finite simply by abstracting from its conditions. Des Cartes answers that the case is just the reverse—the infinite is the positive idea, and the finite is the negative, and therefore the former is the presupposition of the latter. As Kant, at a later date, pointed out that space is not a general conception, abstracted from the ideas of particular spaces, and representing the common element in them, but that, on the contrary, the ideas of particular spaces are got by the limitation of the one infinite space that is prior to them, so Des Cartes maintains in general that the idea of the finite is had only by limitation of the infinite, and not the idea of the infinite by abstraction from the particular determinations of the finite. It is a necessary consequence of this that the self-consciousness of a finite being is bound up with the consciousness of the infinite. Hence the idea of God is not merely one among other ideas which we have, but it is the one idea that is necessary to our very existence as thinking beings, the idea through which alone we can think ourselves, or anything else. "I ought never to suppose," says Des Cartes, "that my conception of the infinite is a negative idea, got by negation of the finite, just as I conceive repose to be merely negation of movement, and darkness merely the negation of light. On the contrary, I see manifestly that there is more reality in the infinite than in the finite substance, and that therefore I have in me the notion of the infinite, *even in some sense prior to the notion of the finite*, or, in other words, that the notion of myself in some sense presupposes the notion of God; for how could I doubt or desire, how could I be conscious of anything as a want, how could I know that I am not altogether perfect, if I had not in me the idea of a being more perfect than myself, by comparison with whom I recognize the defects of my own existence?"¹ Des Cartes then goes on in various ways to illustrate the thesis that the consciousness of a defective and growing nature cannot give rise to the idea of infinite perfection, but on the contrary, presupposes it. We could not think of a series of approximations, unless there were somehow present to us the idea of the completed infinite as the goal we aim at. If we had not the consciousness of ourselves as finite *in relation* to the infinite, either we should not be conscious of ourselves at all, or we should be conscious of ourselves as infinite. The image of God is so impressed by Him upon us, that we "conceive that resemblance wherein the idea of God is contained by the same faculty whereby we are conscious of ourselves." In other words, our consciousness of ourselves is at the same time consciousness of our finitude, and hence of our relation to a being who is infinite.

The principle which underlies the reasoning of Des Cartes is, that to be conscious of a limit, is to transcend it. We could not feel the limits either upon our thought or upon our existence, we could not doubt or desire, if we did not

already apprehend something beyond these limits. Nay, we could not be conscious of our existence as individual selves, if we were not conscious of that which is not ourselves, and of a unity in which both self and not-self are included. Our individual life is therefore to us as self-conscious beings a part of a wider universal life. Doubt and aspiration are but the manifestation of this essential division and contradiction of a nature, which, as conscious of itself, is at the same time conscious of the whole in which it is a part. And as the existence of a self and its consciousness are one, so we may say that a thinking being is not only an individual, but always in some sense identified with that universal unity of being to which it is essentially related.

If Des Cartes had followed out this line of thought, he would have been led at once to the pantheism of Spinoza, if not beyond it. As it is, he is on the verge of contradiction with himself when he speaks of the consciousness of God as *in some sense* prior to the consciousness of self. How can anything be prior to the first principles of knowledge? It is no answer to say that the consciousness of God is the *principium essendi* while the consciousness of self is the *principium cognoscendi*. For, if the idea of God is prior to the idea of self, knowledge must begin where existence begins, with God. The words "in some sense," with which Des Cartes qualifies his assertion of the priority of the idea of God, only betray his hesitation and his partial consciousness of the contradiction in which he is involved. Some of Des Cartes's critics presented this difficulty to him in another form, and accused him of reasoning in a circle when he said that it is because God cannot lie that we are certain that our clear and distinct ideas do not deceive us. The very existence of the conscious self, the *cogito ergo sum*, which is the first of all truths and therefore prior in certitude to the existence of God, is believed only because of the clearness and distinctness with which we apprehend it. How then, they argued, could God's truthfulness be our security for a principle which we must use in order to prove the being of God? The answer of Des Cartes is somewhat lame. We cannot doubt any self-evident principle, or even any truth based on a self-evident principle, when we are directly contemplating it in all the necessity of its evidence; it is only when we forget or turn away from this evidence, and begin to think of the possibility of a deceitful God, that a doubt arises which cannot be removed except by the conviction that God is true.² It can scarcely be said that this is a *dignus vindice nodus*, or that God can fitly appear as a kind of second-best resource to the forgetful spirit that has lost its direct hold on truth and its faith in itself. God, truth, and the human spirit are thus conceived as having merely external and accidental relations with each other. What Des Cartes, however, is really expressing in this exoteric way, is simply that beneath and beyond all particular truths lies the great general truth of the unity of thought and existence. In contemplating particular truth, we may not consciously relate it to this unity, but when we have to defend ourselves against scepticism, we are forced to realize this relation. The ultimate answer to any attack upon a special aspect or element of truth must be to show that the fate of truth itself, the possibility of knowledge is involved in the rejection of it, and that we cannot doubt it without doubting reason itself. But to doubt reason is, in the language of Des Cartes, to doubt the truthfulness of God, for, in his view, the idea of God is involved in the very constitution of reason. Taken in this way then, the import of Des Cartes's answer is, that the consciousness of self, like every other particular truth, is

¹ *Meditatio tertia*, p. 21.

² *Resp. quarta*, p. 234.

not at first seen to rest on the consciousness of God, but that when we realize what it means we see that it does so rest. But if this be so, then in making the consciousness of self his first principle of knowledge, Des Cartes has stopped short of the truth. It can only be the first principle if it is understood not as the consciousness of the individual self, but in a sense in which the consciousness of self is identical with the consciousness of God.

Des Cartes, however, is far from a clear apprehension of the ultimate unity of thought and being, which nevertheless he strives to find in God. Beginning with an absolute separation of the *res cogitans* from the *res extensa*, he is continually falling back into dualism just when he seemed to have escaped from it. Even in God the absolute unity, idea and reality fall asunder; our idea of God is not God in us, it is only an idea of which God's existence is the cause. But the category of causality, if it forms a bridge between different things, as here between knowing and being, at the same time repels them from each other. It is a category of external relation which may be adequate to express the relation of the finite to the finite, but not the relation of the finite to the infinite. We cannot conceive God as the cause of our idea of him, without making God a purely objective and therefore finite existence. Nor is the case better when we turn to the so-called ontological argument,—that existence is necessarily involved in the idea of God, just as the property of having its angles equal to two right angles is involved in the idea of a triangle. If indeed we understood this as meaning that thought transcends the distinction between itself and existence, and that therefore existence cannot be a thing in itself out of thought, but must be an intelligible world that exists as such only for the thinking being, there is some force in the argument. But this meaning we cannot find in Des Cartes, or to find it we must make him inconsistent with himself. He was so far from having quelled the phantom "thing in itself," that he treated matter in space as such a thing, and thus confused externality of space with externality to the mind. On this dualistic basis, the ontological argument becomes a manifest paralogism, and lies open to all the objections that Kant brought against it. That the idea of God involves existence proves only that God, if he exists at all, exists by the necessity of his being. But the link that shall bind thought to existence is still wanting, and, in consistency with the other presuppositions of Des Cartes it cannot be supplied.

But again, even if we allow to Des Cartes that God is the unity of thought and being, we must still ask what kind of unity? Is it a mere generic unity, reached by abstraction, and therefore leaving out all the distinguishing characteristics of the particulars under it? Or is it a concrete unity to which the particular elements are subordinated, but in which they are nevertheless included? To answer this question, we need only look at the relation of the finite to the infinite, as it is expressed in the passage already quoted, and in many others. Des Cartes always speaks of the infinite as a purely affirmative or positive existence, and of the finite in so far as it is distinguished from the infinite, as purely negative, or in other words as a nonentity. "I am," he says, "a mean between God and nothing, between the Supreme Being and not-being. In so far as I am created by God, there is nothing in me that can deceive me or lead me into error. But on the other hand, if I consider myself as participating in nothingness, or not-being, inasmuch as I am not myself the Supreme Being, but in many ways defective, I find myself exposed to an infinity of errors. Thus error as such is not something real that depends on God, but simply a defect; I do not need to explain it by means of any special faculty bestowed on me by God, but

merely by the fact that the faculty for discerning truth from error with which he has endowed me, is not infinite."¹ But if we follow out this principle to its logical result, we must say not only that error is a consequence of finitude, but also that the very *existence* of the finite as such is an error or illusion. All finitude, all determination, according to the well-known Spinozistic aphorism, is negation, and negation cannot constitute reality. To know the reality of things, therefore, we have to abstract from their limits, or in other words, the only reality is the infinite. Finite being, *qua* finite, has no existence, and finite self-consciousness, consciousness of a self in opposition to, or limited by, a not-self is an illusion. But Des Cartes does not thus reason. He does not see "anything in the nature of the infinite which should exclude the existence of finite things." "What" he asks "would become of the power of that imaginary infinite if it could create nothing? Perceiving in ourselves the power of thinking, we can easily conceive that there should be a greater intelligence elsewhere. And even if we should suppose that intelligence increased *ad infinitum*, we need not fear that our own would be lessened. And the same is true of all other attributes which we ascribe to God, even of his power, provided only that we do not suppose that the power in us is not subjected to God's will. In all points, therefore, He is infinite without any exclusion of created things."² The truth of this view we need not dispute; the question is as to its consistency with Cartesian principles. It may be a higher idea of God to conceive him as revealing himself in and to finite creatures; but it is a different idea from that which is implied in Des Cartes's explanations of error. It is an inconsistency that brings Des Cartes nearer to Christianity, and nearer it may also be said, to a true metaphysic; but it is not the less an inconsistency with his fundamental principles which necessarily disappears in their subsequent development. To conceive the finite as not constituted merely by the absence of some of the positive elements of the infinite, but as in necessary unity with the infinite; to conceive the infinite as not merely that which has no limits, or determinations, but as that which is self-determined and self-manifesting, which through all finitude and manifestation returns upon itself, may not be erroneous. But it would not be difficult to show that the adoption of such a conception involves the rejection or modification of almost every doctrine of the Cartesian system.

In connection with this inconsistency we may notice the very different relations in which Des Cartes conceives mind on the one side and matter on the other, to stand towards God, who yet is the cause of both, and must therefore, by the principle of causality, contain in himself all that is in both. Matter and mind are to Des Cartes absolute opposites. Whatever can be asserted of mind can be denied of matter, whatever can be asserted of matter can be denied of mind. Matter is passive, mind is active; matter is extended, and therefore divisible *ad infinitum*; mind is an indivisible unity. In fact, though of this Des Cartes is not conscious, the determination of the one is mediated by its opposition to the other; the ideas of object and subject, the self and not-self, are terms of a relation distinguishable but inseparable. But in the idea of God we must find a unity which transcends this difference in one way or another, whether by combining the two under a higher notion, or, as it would be more natural to expect on Cartesian principles, by abstracting equally from the particular characteristics of both. Des Cartes really does neither, or rather he acts partly on the one principle and partly on the other. In his idea of God he abstracts from the properties of matter but not from those of mind. "God," he says,

¹ *Meditatio quarta*, p. 26.

² *Resp. ad sec. object.*, p. 75.

"contains in himself *formaliter* all that is in mind, but only *eminenter* all that is in matter;"¹ or, as he elsewhere expresses it more popularly, he is mind, but he is only the creator of matter. And for this he gives as his reason, that matter as being divisible and passive is essentially imperfect. *Ipsa natura corporis multas imperfectiones involvit*, and, therefore, "there is more analogy between sounds and colours than there is between material things and God." But the real imperfection here lies in the abstractness of the Cartesian conception of matter as merely extended, merely passive; and this is balanced by the equal abstractness of the conception of mind or self-consciousness as an absolutely simple activity, a pure intelligence without any object but itself. If matter as absolutely opposed to mind is imperfect, mind as absolutely opposed to matter is equally imperfect. In fact they are the elements or factors of a unity, and lose all meaning when severed from each other, and if we are to seek this unity by abstraction, we must equally abstract from both.

The result of this one-sidedness is seen in the fact that Des Cartes, who begins by separating mind from matter, ends by finding the essence of mind in pure will, i.e., in pure formal self-determination. Hence God's will is conceived as absolutely arbitrary, not determined by any end or law, for all laws, even the necessary truths that constitute reason, spring from God's determination, and do not precede it. "He is the author of the essence of things no less than their existence," and his will has no reason but his will. In man there is an intelligence with eternal laws or truths involved in its structure, which so far limits his will. "He finds the nature of good and truth already determined by God, and his will cannot be moved by anything else." His highest freedom consists in having his will determined by a clear perception of the nature of good and truth, and "he is never indifferent except when he is ignorant of it, or at least does not see it so clearly as to be lifted above the possibility of doubt."² Indifference of will is to him "the lowest grade of liberty," yet, on the other hand, in nothing does the image of God in him show itself more clearly than in the fact that his will is not limited by his clear and distinct knowledge, but is "in a manner infinite." For "there is no object of any will, even the infinite will of God, to which our will does not extend."³ Belief is a free act, for as we can yield our assent to the obscure conceptions presented by sense and the imagination, and thus allow ourselves to be led into error, so on the other hand we can refuse to give this assent, or allow ourselves to be determined by anything but the clear and distinct ideas of intelligence. That which makes it possible for us to err is that also in which the divine image in us is most clearly seen. We cannot have the freedom of God whose will creates the object of his knowledge; but in reserving our assent for the clear and distinct perceptions of intelligence, we, as it were, re-enact for ourselves the divine law, and repeat, so far as is possible to finite beings, the transcendent act of will in which truth and good had their origin.

The inherent defect of this view is the divorce it makes between the form and the matter of intelligence. It implies that reason or self-consciousness is one thing, and that truth is another and quite different thing, which has been united to it by the arbitrary will of God. The same external conception of the relation of truth to the mind is involved in the doctrine of innate ideas. It is true that Des Cartes did not hold that doctrine in the coarse form in which it was attributed to him by Locke, but expressly declares that he has "never said or thought at any time

that the mind required innate ideas which were separated from the faculty of thinking. He had simply used the word innate to distinguish those ideas which are derived from that faculty, and not from external objects or the determination of the will. Just as when we say generosity is innate in certain families, and in certain others diseases, like the gout or the stone, we do not mean to imply that infants in their mother's womb are affected with these complaints."⁴ Yet Des Cartes, as we have seen, does not hold that these truths are involved in the very nature of intelligence as such, so that we cannot conceive a self-conscious being without them. On the contrary we are to regard the divine intelligence as by arbitrary act determining that two and two should be four, or that envy should be a vice. We are "not to conceive eternal truth flowing from God as rays from the sun."⁵ In other words, we are not to conceive all particular truths as different aspects of one truth. It is part of the imperfection of man's finite nature that he "finds truth and good determined for him." It is something given,—given, indeed, along with his very faculty of thinking, but still *given* as an external limit to it. It belongs not to his nature as spirit, but to his finitude as man.

After what has been said, it is obvious that the transition from God to matter must be somewhat arbitrary and external. God's truthfulness is pledged for the reality of that of which we have clear and distinct ideas; and we have clear and distinct ideas of the external world so long as we conceive it simply as extended matter, infinitely divisible, and moved entirely from without,—so long, in short, as we conceive it as the direct opposite of mind, and do not attribute to it any one of the properties of mind. *Omnes proprietates, quas in ea clare percipimus, ad hoc unum reducuntur, quod sit partibilis et mobilis, secundum partes.* We must, therefore, free ourselves from the obscure and confused modes of thought which arise whenever we attribute any of the secondary qualities, which exist merely in our sensations, to the objects that cause these sensations. The subjective character of such qualities is proved by the constant change which takes place in them, without any change of the object in which they are perceived. A piece of wax cannot lose its extension; but its colour, its hardness, and all the other qualities whereby it is presented to sense, may be easily altered. What is objective in all this is merely an extended substance, and the modes of motion or rest through which it is made to pass. In like manner we must separate from our notion of matter all ideas of *actio in distans*,—e.g., we must explain weight not as a tendency to the centre of the earth or an attraction of distant particles of matter, but as a consequence of the pressure of other bodies, immediately surrounding that which is felt to be heavy.⁶ For the only conceivable *actio in distans* is that which is mediated by thought, and it is only in so far as we suppose matter to have in it a principle of activity like thought, that we can accept such explanations of its motion. Again, while we must thus keep our conception of matter clear of all elements that do not belong to it, we must also be careful not to take away from it those that *do* belong to it. It is a defect of distinctness in our ideas when we conceive an attribute as existing apart from its substance, or a substance without its attribute; for this is to treat elements that are only separated by a "distinction of reason," as if they were distinct things. The conception of the possibility of a vacuum or empty space arises merely from our confusing the possible separation of any mode or form of matter from matter in general with the impossible separation of matter in general

from its own essential attribute. Accordingly, in his physical philosophy, Des Cartes attempts to explain everything on mechanical principles, starting with the hypothesis that a certain quantity of motion has been impressed on the material universe by God at the first, a quantity which can never be lost or diminished, and that space is an absolute plenum in which motion propagates itself in circles. It is unnecessary to follow Des Cartes into the detail of the theory of vortices. It is more to the purpose to notice the nature of the reasons by which he is driven to regard such a mechanical explanation of the universe as necessary. A real or substantive existence is, in his view, a *res completa*, a thing that can be conceived as a whole in itself without relations to any other thing. Now matter and mind are, he thinks, such complete existences, so long as we conceive them, as pure intelligence must conceive them, as abstract opposites of each other; and do not permit ourselves to be confused by those mixed modes of thought which are due to sense or imagination. Des Cartes does not see that in this very abstract opposition there is a bond of union between mind and matter, that they are correlative opposites, and therefore in their separation *res incomplete*. In other words, they are merely elements of reality substantiated by abstract thought into independent realities. He indeed partly retracts his assertion that mind and matter severed from each other are *res completa*, when he declares that neither can be conceived as existing apart from God, and that therefore, strictly speaking, God alone is a substance. But as we have seen, he avoids the necessary inference that in God the opposition between mind and matter is reconciled or transcended, by conceiving God as abstract self-consciousness or will, and the material world not as his necessary manifestation, but simply as his creation,—as having its origin in an act of bare volition, and that only. His God is the God of monotheism and not of Christianity, and therefore the world is to God always a foreign matter which he brings into being, and acts on from without, but in which he is not revealed.

It is a natural consequence of this view that nature is essentially *dead matter*, that beyond the motion it has received from God at the beginning, and which it transmits from part to part without increase or diminution, it has no principle of activity in it. Every trace of vitality in it must be explained away as a mere false reflection upon it of the nature of mind. The world is thus "cut in two with a hatchet," and there is no attraction to overcome the mutual repulsion of its severed parts. Nothing can be admitted in the material half that savours of self-determination, all its energy must be communicated, not self-originated; there is no room for gravitation, still less for magnetism or chemical affinity, in this theory. *A fortiori*, animal life must be completely explained away. The machine may be very complicated, but it is still, and can be nothing but, a machine. If we once admitted that matter could be anything but mechanical, we should be on the way to admit that matter could become mind. When a modern physical philosopher declares that everything, even life and thought, is ultimately reducible to matter, we cannot always be certain that he means what he seems to say. Not seldom the materialist *soi-disant* when we hear his account of the properties of matter, turns out to be something like a spiritualist in disguise; but when Des Cartes asserted that everything *but* mind is material, and that the animals are automata, there is no such dubiety of interpretation. He said what he meant, and meant what he said, in the hardest sense his words can bear. His matter was not even gravitating, much less living; it had no property except that of retaining and transmitting the motion received from without by pressure and impact. And his animals were automata, not merely in the sense

of being governed by sensation and instinct, but precisely in the sense that a watch is an automaton. Henry More cries out against the ruthless consequence with which he develops his principles to this result. "In this," he says, "I do not so much admire the penetrative power of your genius as I tremble for the fate of the animals. What I recognize in you is not only subtlety of thought, but a hard and remorseless logic with which you arm yourself as with a sword of steel, to take away life and sensation with one blow, from almost the whole animal kingdom." But Des Cartes was not the man to be turned from the legitimate result of his principles by a scream. "Nec moror astutias et sagacitates canum et vulpium, nec quæcunque alia propter cibum, venerem, aut metum a brutis finit. Propterea enim me posse perfacile illa omnia ut a sola membrorum conformatione projecta explicare."¹

The difficulty reaches its height when Des Cartes attempts to explain the union of the body and spirit in man. Between two substances which, when clearly and distinctly conceived, do not imply each other, there can be none but an artificial unity,—a unity of composition that still leaves them external to each other. Even God cannot make them one in any higher sense.² And as it is impossible in the nature of mind to see any reason why it should be embodied, or in the nature of matter to see any reason why it should become the organ of mind, the union of the two must be taken as a mere empirical fact. When we put on the one side all that belongs to intelligence, and on the other all that belongs to matter, there is a residuum in our ideas which we cannot reduce to either head. This residuum consists of our appetites, our passions, and our sensations, including not only the feelings of pain and pleasure, but also the perceptions of colour, smell, taste, of hardness and softness, and all the other qualities apprehended by touch. These must be referred to the union of mind with body. They are subjective in the sense that they give us no information either as to the nature of things or of mind. Their function is only to indicate what things are useful or hurtful to our composite nature as such, or in other words what things tend to confirm or dissolve the unity of mind and body. They indicate that *something* is taking place in our body, or without it, and so stimulate us to some kind of action, but *what* it is that is taking place they do not tell us. There is no resemblance in the sensation of pain produced by great heat to the rending of the fibres of our body that causes it. But we do not need to know the real origin of our sensation to prevent us going too near the fire. Sensation leads us into error only when we are not conscious that its office is merely practical, and when we attempt to make objective judgments by means of its obscure and confused ideas, *e.g.*, when we say that there is heat in our hands or in the fire. And the remedy for this error is to be found simply in the clear conviction of the subjectivity of sensation.

These views of the nature of sense, however, at once force us to ask how Des Cartes can consistently admit that a subjective result such as sensation, a result in mind, should be produced by matter, and on the other hand how an objective result, a result in matter, should be effected by mind. Des Cartes explains at great length, according to his modification of the physiology of the day, that the pineal gland, which is the immediate organ of the soul, is acted on by the nerves through the "animal spirits," and again by reaction upon these spirits produces motions in the body. It is an obvious remark that this explanation either materializes mind, or else puts for the solution the very problem to be solved. It was therefore in the spirit of Des Cartes, it was only making explicit what

¹ *Epist.*, i. 66, 67² *Princ.*, i. 60.

is involved in many of his expressions when Geulinx, one of his earliest followers, formulated the theory of occasional causes. The general approval of the Cartesian school proved that this was a legitimate development of doctrine. Yet it tore away the last veil from the absolute dualism of the system, which had so far stretched the antagonism of mind and matter that no mediation remained possible, or what is the same thing, remained possible only through an inexplicable will of God. The intrusion of such a *Deus ex machina* into philosophy only showed that philosophy by its violent abstraction had destroyed the unity of the known and intelligible world, and was, therefore, forced to seek that unity in the region of the unknown and unintelligible. If our light be darkness, then in our darkness we must seek for light; if reason be contradictory in itself, truth must be found in unreason. The development of the Cartesian school was soon to show what is the necessary and inevitable end of such worship of the unknown.

To the ethical aspect of his philosophy, Des Cartes, unlike his great disciple, only devoted a subordinate attention. In a short treatise, however, he discussed the relation of reason to the passions. After we have got over the initial difficulty, that matter should give rise to effects in mind, and mind in matter, and have admitted that in man the unity of mind and body turns what in the animals is mere mechanical reception of stimulus from without and reaction upon it into an action and reaction mediated by sensation, emotion, and passion, another question presents itself. How can the mere natural movement of passion, the nature of which is fixed by the original constitution of our body, and of the things that act upon it, be altered or modified by pure reason? For while it is obvious that morality consists in the determination of reason by itself, it is not easy to conceive how the same being who is determined by passion from without should also be determined by reason from within. How, in other words, can a spiritual being maintain its character as self-determined, or at least determined only by the clear and distinct ideas of the reason which are its innate forms, in the presence of this foreign element of passion that seems to make it the slave of external impressions? Is reason able to crush this intruder, or to turn it into a servant? Can the passions be annihilated, or can they be spiritualized? Des Cartes could not properly adopt either alternative; he could not adopt the ethics of asceticism, for the union of body and mind is, in his view, natural; and hence the passions which are the results of that union are in themselves good. They are provisions of nature for the protection of the unity of soul and body, and stimulate us to the acts necessary for that purpose. Yet, on the other hand, he could not admit that these passions are capable of being completely spiritualized; for so long as the unity of body and soul is regarded as merely external and accidental, it is impossible to think that the passions which arise out of this unity can be transformed into the embodiment and expression of reason. Des Cartes, indeed, points out that every passion has a lower and a higher form, and while in its lower or primary form it is based on the obscure ideas produced by the motion of the animal spirits, in its higher form it is connected with the clear and distinct judgments of reason regarding good and evil. If, however, the unity of soul and body be a unity of composition, there is an element of obscurity in the judgments of passion which cannot be made clear, an element in desire that cannot be spiritualized. If the mind be external to the passions it can only impose upon them an external rule of moderation. On such a theory no ideal morality is possible to man in his present state; for, in order to the attainment of such an ideal morality, it would be necessary that the accidental

element obtruded into his life as a spiritual being by his connection with the body should be expelled. What can be attained under present conditions is only to abstract so far as is possible from external things, and those relations to external things into which passion brings us. Hence the great importance which Des Cartes attaches to the distinction between things in our power, and things not in our power. What is not in our power includes all outward things, and therefore it is our highest wisdom to regard them as determined by an absolute fate, or the eternal decree of God. We cease to wish for the impossible; and therefore to subdue our passions we only need to convince ourselves that no effort of ours can enable us to secure their objects. On the other hand that which is within our power, and which therefore we cannot desire too earnestly, is virtue. But virtue in this abstraction from all objects of desire is simply the harmony of reason with itself, the *ἀραπαξία* of the Stoic under a slight change of aspect. Thus in ethics, as in metaphysics, Des Cartes ends not with a reconciliation of the opposed elements, but with a dualism, or at best, with a unity which is the result of abstraction.

MALEBRANCHE was prepared, by the ascetic training of the cloister and the teaching of Augustine, to bring to clear consciousness and expression many of the tendencies that were latent and undeveloped in the philosophy of Des Cartes. To use a chemical metaphor, the Christian Platonism of the church father was a medium in which Cartesianism could precipitate the product of its elements. Yet the medium was, as we shall see, not a perfect one, and hence the product was not quite pure. Without metaphor, Malebranche, by his previous habits of thought, was well fitted to detect and develop the pantheistic and ascetic elements of his master's philosophy. But he was not well fitted to penetrate through the veil of popular language under which the discordance of that philosophy with orthodox Christianity was hidden. On the contrary, the whole training of the Catholic priest, and especially his practical spirit, with that tendency to compromise which a practical spirit always brings with it, enabled him to conceal from himself as well as from others the logical result of his principles. And we do not wonder even when we find him treating as a "miserable" the philosopher who tore away the veil.

Malebranche saw "*all things in God*." In other words, he taught that knowledge is possible only in so far as thought is the expression, not of the nature of the individual subject as such, but of a universal life in which he and all other rational beings partake. "No one can feel my individual pain; every one can see the truth which I contemplate—why is it so? The reason is that my pain is a modification of my substance, but truth is the common good of all spirits."¹ This idea is ever present to Malebranche, and is repeated by him in an endless variety of forms of expression. Thus, like Des Cartes, but with more decision, he tells us that the idea of the infinite is prior to the idea of the finite. "We conceive of the infinite being by the very fact that we conceive of being without thinking whether it be finite or no. But in order that we may think of a finite being, we must necessarily cut off or deduct something from the general notion of being, which consequently we must previously possess. Thus the mind does not apprehend anything whatever, except in and through the idea that it has of the infinite; and so far is it from being the case that this idea is formed by the confused assemblage of all the ideas of particular things as the philosophers maintain, that, on the contrary, all these particular ideas are only participations in the general idea of the

¹ *Morale*, i. 1, § 2.

infinite, just as God does not derive His being from the creatures, but all the creatures are imperfect participations of the divine Being.¹ Again, he tells us, in the same chapter, that "when we wish to think of any particular thing, we first cast our view upon all being, and then apply it to the consideration of the object in question. We could not desire to see any particular object unless we saw it already in a confused and general way, and as there is nothing which we cannot desire to see, so all objects must be in a manner present to our spirit." Or, as he puts it in another place, "our mind would not be capable of representing to itself the general ideas of genera and species if it did not see all things as contained in one; for every creature being an individual we cannot say that we are apprehending any created thing when we think the general idea of a triangle." The main idea that is expressed in all these different ways is simply this, that to determine any individual object as such, we must relate it to, and distinguish it from, the whole of which it is a part; and that, therefore, thought could never apprehend anything if it did not bring with itself the idea of the intelligible world as a unity. Des Cartes had already expressed this truth in his *Meditations*, but he had deprived it of its full significance by making a distinction between the being and the idea of God, the former of which, in his view, was only the cause of the latter. Malebranche detects this error, and denies that there is any idea of the infinite, which is a somewhat crude way of saying that there is no division between the idea of the infinite and its reality. What Reid asserted of the external world, that it is not represented by an idea in our minds, but is actually present to them, Malebranche asserted of God. No individual thing, he tells us—and an idea is but an individual thing—could represent the infinite. On the contrary, all individual things are represented through the infinite Being, who contains them all in His substance *très efficace, et par conséquence très intelligible*.² We know God by himself, material things only by their ideas in God, for they are "unintelligible in themselves, and we can see them only in the being who contains them in an intelligible manner." And thus, unless we in some way "saw God, we should be able to see nothing else." The vision of God or in God, therefore, is an "intellectual intuition" in which seer and seen, knower and known, are one. Our knowledge of things is our participation in God's knowledge of them. When we have gone so far with Malebranche, we are tempted to ask why he does not follow out his thought to its natural conclusion. If the idea of God is not separable from His existence, if it is through the idea of Him that all things are known, and through His existence that all things are, then it would seem necessarily to follow that our consciousness of God is but a part of God's consciousness of Himself, that our consciousness of self and other things is but God's consciousness of them, and lastly, that there is no existence either of ourselves or other things except in this consciousness. To understand Malebranche is mainly to understand how he stopped short of results that seemed to lie so directly in the line of his thought.

To begin with the last point, it is easy to see that Malebranche only asserts unity of idea and reality in God, to deny it everywhere else, which with him is equivalent to asserting it in general and denying it in particular. To him, as to Des Cartes, the opposition between mind and matter is absolute. Material things cannot come into our minds nor can our minds go out of themselves *pour se promener dans les cieux*.³ Hence they are in themselves absolutely unknown; they are known only in God, in whom are their ideas, and as these ideas

again are quite distinct from the reality, they "might be presented to the mind without anything existing." That they exist *out of* God in another manner than the intelligible manner of their existence *in* God, is explained by a mere act of His will, that is, it is not explained at all. Though we see all things in God, therefore, there is no connection between His existence and theirs. The "world is not a necessary emanation of divinity; God is perfectly self-sufficient, and the idea of the infinitely perfect Being can be conceived quite apart from any other. The existence of the creatures is due to the free decrees of God." Malebranche, therefore, still treats of external things as "things in themselves," which have an existence apart from thought, even the divine thought, though it is only in and through the divine thought they can be known by us. "To see the material world, or rather to judge that it exists (since in itself it is invisible), it is necessary that God should reveal it to us, for we cannot see the result of His arbitrary will through necessary reason."⁴

But if we know external things only through their idea in God, how do we know ourselves? Is it also through the idea of us in God? Here we come upon a point in which Malebranche diverges very far from his master. We do not, he says, properly *know* ourselves at all, as we know God or even external objects. We are conscious of ourselves by inner sense (*sentiment intérieur*), and from this we know *that* we are, but we do not know *what* we are. "We know the existence of our soul more distinctly than of our body, but we have not so perfect a knowledge of our soul as of our body." This is shown by the fact that from our idea of body as extended substance, we can at once see what are its possible modifications. In other words, we only need the idea of extended substance to see that there is an inexhaustible number of figures and motions of which it is capable. The whole of geometry is but a development of what is given already in the conception of extension. But it is not so with our consciousness of self, which does not enable us to say prior to actual experience what sensations or passions are possible to us. We only know what heat, cold, light, colour, hunger, anger, and desire are by feeling them. Our knowledge extends as far as our experience and no further. Nay, we have good reason to believe that many of these modifications exist in our soul only by reason of its accidental association with a body, and that if it were freed from that body it would be capable of far other and higher experiences. "We know by feeling that our soul is great, but perhaps we know almost nothing of what it is in itself." The intimations of sense have, as Des Cartes taught, only a practical but no theoretical value; they tell us nothing of the external world, the real nature of which we know not through touch and taste and sight, but only through our idea of extended substances; while of the nature of the soul they do not tell us much more than that it exists and that it is not material. And in this latter case we have no idea, nothing better than sense to raise us above its illusions. It is clear from these statements that by self-consciousness Malebranche means consciousness of desires and feelings, which belong to the individual as such, and not consciousness of self as thinking. He begins, in fact, where Des Cartes ended, and identifies the consciousness of self as thinking, and so transcending the limits of its own particular being, with the consciousness or idea of God. And between the consciousness of the finite in sense, and the consciousness of the infinite in thought, or in other words, between the consciousness of the universal and the consciousness of the individual, he sees no connection. Malebranche is just one step from the pantheistic conclusion that the consciousness

¹ *Pecherche*, iii. pt. ii. ch. 6.² *Ibid.* ch. 7.³ *Ibid.*, ch. 1.⁴ *Morale*, i. 1, § 5.⁵ *Entretien*, i. § 5.

of finite individuality as such is illusory, and that as all bodies are but modes of one infinite extension, so all souls are but modes of one infinite thought. But while he willingly accepts this result in regard to matter, his religious feelings prevent him from accepting it in relation to mind. He is driven, therefore, to the inconsistency of holding that sense and feeling, through which in his view we apprehend the finite as such, give us true though imperfect knowledge of the soul, while the knowledge they give us of body is not only imperfect but false.¹ Thus the finite spirit is still allowed to be a substance, distinct from the infinite, though it holds its substantial existence on a precarious tenure. It is left hanging, we may say, on the verge of the infinite, whose attraction must soon prove too strong for it. Ideas are living things, and often remould the minds that admit them in spite of the greatest resistance of dead custom and traditionary belief. In the grasp of a logic that overpowers him the more easily that he is unconscious of its tendency, Malebranche is brought within one step of the pantheistic conclusion, and all his Christian feeling and priestly training can do, is just to save him from denial of the personality of man.

But even this denial is not the last word of pantheism. When the principle that the finite is known only in relation to the infinite, the individual only in relation to the universal, is interpreted as meaning that the infinite and universal is complete in itself without the finite and individual, when the finite and individual is treated as a mere accidental existence due to the "arbitrary will of God," it ceases to be possible to conceive even God as a spirit. Did Malebranche realize what he was saying when he declared that God was "being in general," but not any particular being? At any rate we can see that the same logic that leads him almost to deny the reality of finite beings, leads him also to seek the divine nature in something more abstract and general even than thought. If we must abstract from all relation to the finite in order to know God as he is, is it not necessary for us also to abstract from self-consciousness, for self-consciousness has a negative element in it that is something definite and therefore limited? We do not wonder, therefore, when we find Malebranche saying that reason does not tell us that God is a spirit, but only that He is an infinitely perfect being, and that he must be conceived rather as a spirit than as a body simply because spirit is more perfect than body. "When we call God a spirit, it is not so much to show positively what he is, as to signify that he is not material." But as we ought not to give him a bodily form like man's, so we ought not to think of his spirit as similar to our own spirits, although we can conceive nothing more perfect. "It is necessary rather to believe that as he contains in himself the properties of matter without being material, so he comprehends in himself the perfections of created spirits without being a spirit as we alone can conceive spirits, and that his true name is 'He who is,' i.e., Being without restriction, Being infinite and universal."² Thus the essentially self-revealing God of Christianity gives way to pure spirit, and pure spirit in its turn to the eternal and incomprehensible substance of which we can say nothing but that it is. The divine substance contains in it, indeed, everything that is in creation, but it contains them *eminenter* in some incomprehensible form that is reconcilable with its infinitude. But we have no adequate name by which to call it except Being. The curious metaphysic of theology by which, in his later writings, Malebranche tried to make room for the incarnation by supposing that the finite creation, which as finite is unworthy of God, was made worthy by union with Christ, the divine Word, shows that

Malebranche had some indistinct sense of the necessity of reconciling his philosophy with his theology; but it shows also the necessarily artificial nature of the combination. The result of the union of such incongruous elements was something which the theologians at once recognized as heterodox and the philosophers as illogical.

There was another doctrine of Malebranche which brought him into trouble with the theologians, and which was the main subject of his long controversy with Arnauld. This was his denial of particular providence. As Leibnitz maintained that this is the best of all possible worlds, and that its evils are to be explained by the negative nature of the finite, so Malebranche, with a slight change of expression, derived evil from the nature of particular or individual existence. It is not conformable to the nature of God to act by any but universal laws, and these universal laws necessarily involve particular evil consequences, though their ultimate result is the highest possible good. The question why there should be any particular existence, any existence but God, seeing such existence necessarily involves evil, remains insoluble so long as the purely pantheistic view of God is maintained; and it is this view which is really at the bottom of the assertion that he can have no particular volitions. To the coarse and anthropomorphic conception of particular providence Malebranche may be right in objecting, but on the other hand, it cannot be doubted that any theory in which the universal is absolutely opposed to the particular, the infinite to the finite, is unchristian as well as unphilosophical. For under this dualistic presupposition, there seem to be only two possible alternatives open to thought; either the particular and finite must be treated as something independent of the universal and infinite, which involves an obvious contradiction, or else it must be regarded as absolute nonentity. We find Malebranche doing the one or the other as occasion requires. Thus he vindicates the freedom of man's will on the ground that the universal will of God does not completely determine the particular volitions of man; and then becoming conscious of the difficulty involved in this conception, he tries, like Des Cartes, to explain the particular will as something merely negative, a defect, and not a positive existence.

But to understand fully Malebranche's view of freedom and the ethical system connected with it, we must notice an important alteration which he makes in the Cartesian theory of the relation of will and intelligence. To Des Cartes, as we have seen, the ultimate essence of mind lay in pure abstract self-determination or will, and hence he based even moral and intellectual truth on the arbitrary decrees of God. With Malebranche, on the other hand, abstraction goes a step further; and the absolute is sought not in the subject as opposed to the object, not in pure formal self-determination as opposed to that which is determined, but in a unity that transcends this difference. With him, therefore, will ceases to be regarded as the essence of intelligence, and sinks into a property or separable attribute of it. As we can conceive an extended substance without actual movement, so, he says, we can conceive a thinking substance without actual volition. But "matter or extension without motion would be entirely useless and incapable of that variety of forms for which it is made; and we cannot, therefore, suppose, that an all-wise Being would create it in this way. In like manner, if a spiritual or thinking substance were without will, it is clear that it would be quite useless, for it would not be attracted towards the objects of its perception, and would not love the good for which it is made. We cannot therefore conceive an intelligent being so to fashion it."³ Now God need not be conceived as creating at all, for he is self-

¹ *Recherche*, iii. pt. ii. ch. 7, § 4

² *Ibid.*, ch. 9.

³ *Recherche*, i. pt. i. ch. 1.

sufficient; but if he be a creator of spirits, he must create them for himself. "God cannot will that there should exist a spirit that does not love him, or that loves him less than any other good."¹ The craving for good in general, for an absolute satisfaction, is a *natural* love of God that is common to all. "The just, the wicked, the blessed, and the damned all alike love God with this love." Out of this love of God arises the love we have to ourselves and to others, which are the *natural inclinations* that belong to all created spirits. For these inclinations are but the elements of the love which is in God, and which therefore he inspires in all his creatures. "*Il s'aime, il nous aime, il aime toutes ses créatures; il ne fait donc point d'esprits qu'il ne les porte à l'aimer, à s'aimer, et à aimer toutes les créatures.*"² Stripping this thought of its theological vesture, what is expressed here is simply that as a spiritual being each man is conscious of his own limited and individual existence, as well as of the limited and individual existence of other beings like himself, only in relation to the whole in which they are parts, so he can find his own good only in the good of the whole, and he is in contradiction with himself so long as he rests in any good short of that. His love of happiness, his natural inclinations both selfish and social, may be therefore regarded as an undeveloped form of the love of God; and the ideal state of his inclinations is that in which the love of self and of others are explicitly referred to that higher affection; or in which his love does not proceed from a part to the whole, but from the whole to the parts.

The question of morals to Malebranche is the question how these *natural inclinations* are related to the particular passions. Sensation and passion arise out of the connection of body and soul, and their use is only to urge us to attend to the wants of the former. We can scarcely hear without a smile the simple monastic legend which Malebranche weaves together about the original nature of the passions and their alteration by the Fall. "It is visibly a disorder that a spirit capable of knowing and loving God should be obliged to occupy itself with the needs of the body." "A being altogether occupied with what passes in his body and with the infinity of objects that surround it, cannot be thinking on the things that are truly good."³ Hence the necessity of an immediate and instinctive warning from the senses in regard to the relations of things to our organism, and also of pains and pleasures which may induce us to attend to this warning. "Sensible pleasure is the mark that nature has attached to the use of certain things in order that without having the trouble of examining them by reason, we may employ them for the preservation of the body, but not in order that we may love them."⁴ Till the Fall the mind was merely united to the body, not subjected to it, and the influence of these pleasures and pains was only such as to make men attend to their bodily wants, but not to occupy the mind, or fill it with sensuous joys and sorrows, or trouble its contemplation of that which is really good. Our moral aim should therefore be to restore this state of things, to weaken our union with the body and strengthen our union with God. And to encourage us in pursuing this aim we have to remember that union with God is natural to the spirit, and that, while even the condition of union with the body is artificial, the condition of subjection to the body is wholly unnatural to it. Our primary tendency is towards the supreme good, and we only love the objects of our passions in so far as we "determine towards particular, and therefore false goods, the love that God gives us for himself." The search for happiness is really the search for God in

disguise, and even the levity and inconstancy with which men rush from one finite good to another, is a proof that they were made for the infinite. Furthermore, this natural love of God, or inclination for good in general, "gives us the power of suspending our consent in regard to those particular goods which do not satisfy it."⁵ If we refuse to be led by the obscure and confused voice of instinctive feeling, which arises from and always tends to confirm our union with the body, and wait for the light of reason which arises from and always tends to confirm our union with God, we have done all that is in our power, the rest is God's work. "If we only judge precisely of that which we see clearly, we shall never be deceived. For then it will not be we that judge, but the universal reason that judges in us."⁶ And as our love, even of particular goods, is a confused love of the supreme good, so the clear vision of God inevitably brings with it the love of Him. "We needs must love the highest when we see it." When it is the divine reason that speaks in us it is the divine love that moves us, "the same love wherewith God loves himself and the things he has made."⁷

The general result of the ethics of Malebranche is ascetic. The passions like the senses have no relation to the higher life of the soul; their value is only in relation to the union of soul and body, a union which is purely accidental or due to the arbitrary will of God. As Pericles said of women that the less they were heard of in public for good or evil the better, so Malebranche would say of the sensations and passions, that the more silently they discharge their provisional function, and the less they disturb or interfere with the pure activity of spirit, the more nearly they approach to the only perfection that is possible for them. Their ideal state is to remain or become again simple instincts that act mechanically like the circulation of the blood. Universal light of reason casts no ray into the obscurity of sense; its universal love cannot embrace any of the objects of particular passion. It is indeed recognized by Malebranche that sensation in man is mixed with thought, that the passions in him are forms of the love of good in general. But this union of the rational with the sensuous nature is regarded merely as a confusion which is to be cleared up, *not* in a higher unity of the two elements, but simply by the withdrawal of the spirit from contact with that which darkens and defiles it. Of a transformation of sense into thought, of passion into duty,—an elevation of the life of sense till it becomes the embodiment and expression of the life of reason,—Malebranche has no conception. Hence the life of reason turns with him to mysticism in theory and to asceticism in practice. His universal is abstract and opposed to the particular; instead of explaining it, it explains it away. A certain tender beauty as of twilight is spread over the world as we view it through the eyes of this cloistered philosopher, and we do not at first see that the softness and ideality of the picture is due to the gathering darkness. Abstraction seems only to be purifying, and not destroying, till it has done its perfect work. Malebranche conceived himself to be presenting to the world only the purest and most refined expression of Christian ethics and theology. But if we obey his own continual advice to think clearly and distinctly, if we divest his system of all the sensuous and imaginative forms in which he has clothed it, and reduce it to the naked simplicity of its central thought, what we find is not a God that reveals Himself in the finite and to the finite, but the absolute substance which has no revelation, and whose existence is the negation of all but itself. Thus to tear away the veil, however, there was needed a stronger, simpler,

¹ *Recherche*, i. pt. i. ch. 4.² *Ibid.*, iv. ch. 1.³ *Entretien*, iv.⁴ *Recherche*, bk. v. ch. 4.⁵ *Recherche*, iv. ch. 1.⁶ *Morale*, pt. i. ch. 1, § 9.⁷ *Recherche*, iv. ch. 5.

and freer spirit,—a spirit less influenced by opinion, less inclined to practical compromise, and gifted with a stronger "faith in the whispers of the lonely muse" of speculation than Malebranche.

It is a remark of Hegel's that SPINOZA, as a Jew, first brought into European thought the idea of an absolute unity in which the difference of finite and infinite is lost. Some later writers have gone further, and attempted to show that the main doctrines by which his philosophy is distinguished from that of Des Cartes were due to the direct influences of Jewish writers like Maimonides, Gersonides, and Chasdai Creskas, rather than to the necessary development of Cartesian ideas. And it is undoubtedly true that many points of similarity with such writers, reaching down even to verbal coincidence, may be detected in the works of Spinoza, although it is not so easy to determine how much he owed to their teaching. His own view of his obligations is sufficiently indicated by the fact, that while in his ethics he carries on a continual polemic against Des Cartes, and strives at every point to show that his own doctrines are legitimately derived from Cartesian principles, he only once refers to Jewish philosophy as containing an obscure and unreasoned anticipation of these doctrines. "*Quod quidam Hebræorum quasi per nebulam vidisse videntur qui scilicet statuunt Deum Dei intellectum resque ab ipso intellectus unum et idem esse.*"¹ It may be that the undeveloped pantheism and rationalism of the Jewish philosophers had a deeper influence than he himself was aware of, in emancipating him from the traditions of the synagogue, and giving to his mind its first philosophical bias. In his earlier work there are Neo-Platonic ideas and expressions which in the *Ethics* are rejected or remoulded into a form more suitable to the spirit of Cartesianism. But the question, after all, has little more than a biographical interest. In the Spinozistic philosophy there are few differences from Des Cartes which cannot be traced to the necessary development of Cartesian principles; and the comparison of Malebranche shows that the development might take place under the most diverse intellectual conditions. What is most remarkable in Spinoza is just the freedom and security with which these principles are followed out to their last result. His Jewish origin and his breach with Judaism completely isolated him from every influence but that of the thought that possesses him. And no scruple or hesitation, no respect for the institutions or feelings of his time interferes with his speculative consequence. He exhibits to us the almost perfect type of a mind without superstitious, which has freed itself from all but reasoned and intelligent convictions, or, in the Cartesian phrase, "clear and distinct ideas;" and when he fails, it is not by any inconsistency, or arbitrary stopping short of the necessary conclusions of his logic, but by the essential defect of his principles.

Spinoza takes his idea of method from mathematics, and after the manner of Euclid, places at the head of each book of his *Ethics* a certain number of definitions, axioms, and postulates which are supposed to be intuitively certain, and to form a sufficient basis for all that follows. Altogether there are twenty-seven definitions, twenty axioms, and eight postulates. If Spinoza is regarded as the most consequent of philosophers it cannot be because he has based his system upon so many fragmentary views of truth; it must be because a deeper unity has been discerned in the system than is visible on the first aspect of it. We must, therefore, to a certain extent distinguish between the form and the matter of his thought, though it is also true that the defective form itself involves a defect in the matter.

What in the first instance recommends the geometrical method to Spinoza is, not only its apparent exactness and the necessity of its sequence, but, so to speak, its disinterestedness. Confusion of thought arises from the fact that we put ourselves, our desires and feelings and interests, into our view of things; that we do not regard them as they are in themselves, in their essential nature, but look for some final cause, that is some relation to ourselves by which they may be explained. For this reason, he says, "the truth might for ever have remained hid from the human race, if mathematics, which looks not to the final cause of figures, but to their essential nature and the properties involved in it, had not set another type of knowledge before them." To understand things is to see how all that is true of them flows from the clear and distinct idea expressed in their definition, and ultimately, it is to see how all truth flows from the *essentia Dei* as all geometrical truth flows from the idea of quantity. To take a mathematical view of the universe, therefore, is to raise ourselves above all consideration of the end or tendency of things, above the fears and hopes of mortality into the region of truth and necessity. "When I turned my mind to this subject," he says in the beginning of his treatise on politics, "I did not propose to myself any novel or strange aim, but simply to demonstrate by certain and indubitable reason those things which agree best with practice. And in order that I might inquire into the matters of this science with the same freedom of mind with which we are wont to treat lines and surfaces in mathematics, I determined not to laugh or to weep over the actions of men, but simply to understand them; and to contemplate their affections and passions, such as love, hate, anger, envy, arrogance, pity, and all other disturbances of soul not as vices of human nature, but as properties pertaining to it in the same way as heat, cold, storm, thunder pertain to the nature of the atmosphere. For these, though troublesome, are yet necessary, and have certain causes through which we may come to understand them, and thus, by contemplating them in their truth, gain for our minds as much joy as by the knowledge of things that are pleasing to the senses." All our errors as to the nature of things arise from our judging them from the point of view of the part and not of the whole, from a point of view determined by their relation to our own individual being, and not from a point of view determined by the nature of the things themselves; or, to put the same thing in another way, from the point of view of sense and imagination, and not from the point of view of intelligence. Mathematics shows us the inadequacy of such knowledge when it takes us out of ourselves into things, and when it presents these things to us as objects of universal intelligence apart from all special relation to our individual feelings. And Spinoza only wishes that the same universality and freedom of thought which belongs to mathematics, because its objects *do not* interest the passions, should be extended to those objects that *do* interest them. Purity from interest is the first condition of the philosopher's being; he must get beyond the illusion of sense and passion that makes our own lives so supremely important and interesting to us simply because they are our own. He must look at the present as it were through an inverted telescope of reason, that will reduce it to its due proportion and place in the sum of things. To the heat of passion and the higher heat of imagination, Spinoza has only one advice,—"*Acquaint yourself with God and be at peace.*" Look not to the particular but to the universal, view things not under the form of the finite and temporal, but *sub quadam specie eternitatis*.

The illusion of the finite,—the illusion of sense, imagination, and passion, which, in Bacon's language, tends to make men judge of things *ex analogia hominis* and not *ex*

¹ *Eth.*, ii. schol. 7.

analogia universi, which raises the individual life, and even the present moment of the individual life, with its passing feelings, into the standard for measuring the universe,—this, in the eyes of Spinoza, is the source of all error and evil to man. On the other hand, his highest good is to live the universal life of reason, or what is the same thing, to view all things from their centre in God, and to be moved only by the passion for good in general, “the intellectual love of God.” In the treatise *De Emendatione Intellectus*, Spinoza takes up this contrast in the first instance from its moral side. “All our felicity or infelicity is founded on the nature of the object to which we are joined by love.” To love the things that perish is to be in continual trouble and disturbance of passion; it is to be full of envy and hatred towards others who possess them; it is to be ever striving after that which, when we attain it, does not satisfy us; or lamenting over the loss of that which inevitably passes away from us; only “love to an object that is infinite and eternal feeds the soul with a changeless and unmingled joy.” But again our love rests upon our knowledge; if we saw things as they really are we should love only the highest object. It is because sense and imagination give to the finite an independence and substantiality that do not belong to it, that we waste our love upon it as if it were infinite. And as the first step towards truth is to understand our error, so Spinoza proceeds to explain the defects of common sense, or in other words, of that first and unreflected view of the world, which he, like Plato, calls opinion. Opinion is a kind of knowledge derived partly from hearsay, and partly from *experientia vaga*. It consists of vague and general conceptions of things, got either from the report of others or from an experience which has not received any special direction from intelligence. The mind that has not got beyond the stage of opinion takes things as they present themselves in its individual experience; and its beliefs grow up by association of whatever happens to have been found together in that experience. And as the combining principle of the elements of opinion is individual and not universal, so its conception of the world is at once fragmentary and accidental. It does not see things in their connection with the unity of the whole, and hence it cannot see them in their true relation to each other. “I assert expressly,” says Spinoza, “that the mind has no adequate conception either of itself or of external things, but only a confused knowledge of them, so long as it perceives them only in the common order of nature, i.e., so long as it is *externally determined* to contemplate this or that object by the accidental concurrence of things, and so long as it is not *internally determined* by the unity of thought in which it considers a number of things to understand their agreements, differences, and contradictions.”¹

There are two kinds of errors which are usually supposed to exclude each other, but which Spinoza finds to be united in opinion. These are the errors of abstraction and imagination; the former explains its vice by defect, the latter its vice by excess. On the one hand, opinion is abstract and one-sided; it is defective in knowledge and takes hold of things only at one point. On the other hand, and just because of this abstractness and one-sidedness, it is forced to give an artificial completeness and independence to that which is essentially fragmentary and dependent. The word abstract is misleading, in so far as we are wont to associate with abstraction the idea of a mental effort by which parts are separated from a given whole; but it may be applied without violence to any imperfect conception, in which things that are really elements of a greater whole are treated as if they were *res*

complete, independent objects, complete in themselves. And in this sense the ordinary consciousness of man is often the victim of abstractions when it supposes itself most of all to be dealing with realities. The essences and substances of the schoolman may delude him, but he cannot think these notions clearly without seeing that they are only abstract elements of reality, and that they have a meaning only in relation to the other elements of it. But common sense remains unconscious of its abstractness because imagination gives a kind of substantiality to the fragmentary and limited, and so makes it possible to conceive it as an independent reality. Pure intelligence seeing the part as it is in itself could never see it but as a part. Thought, when it rises to clearness and distinctness in regard to any finite object, must at once discern its relation to other finite objects and to the whole,—must discern, in Spinozistic language, that it is “modal” and not “real.” But though it is not possible to *think* the part as a whole it is possible to picture it as a whole. The limited image that fills the mind’s eye seems to need nothing else for its reality. We cannot think a house clearly and distinctly in all the connection of its parts with each other, without seeing its necessary relation to the earth on which it stands, to the pressure of the atmosphere, &c. The very circumstances by which the possibility of such an existence is explained make it impossible to conceive it apart from other things. But nothing hinders me to rest on a house as a complete picture by itself. Imagination represents things in the externality of space and time, and is subjected to no other conditions but those of space and time. Hence it can begin anywhere, and stop anywhere. For the same cause it can mingle and confuse together all manner of inconsistent forms—can imagine a man with a horse’s head, a candle blazing in vacuo, a speaking tree, a man changed into an animal. There may be elements in the nature of these things that would prevent such combinations; but these elements are not necessarily present to the ordinary consciousness, the abstractness of whose conceptions leaves it absolutely at the mercy of imagination or accidental association. To thought in this stage anything is possible that can be pictured. On the other hand, as knowledge advances, this freedom of combination becomes limited, “the less the mind understands and the more it perceives, the greater is its power of fiction, and the more it understands, the narrower is the limitation of that power. For just as in the moment of consciousness we cannot imagine that we do not think, so after we have apprehended the nature of body, we cannot conceive of a fly of infinite size, and after we know the nature of a soul we cannot think of it as a square, though we may use the words that express these ideas.”² Thus, according to Spinoza, the range of possibility narrows as knowledge widens, until to perfected knowledge possibility is lost in necessity.

From these considerations, it follows that all thought is imperfect that stops short of the absolute unity of all things. Our first imperfect notion of things as isolated from each other, or connected only by co-existence and succession, is a mere imagination of things. It is a fictitious substantiation of isolated moments in the eternal Being. Knowledge, so far as it deals with the finite, is engaged in a continual process of self-correction which can never be completed, for at every step there is an element of falsity, in so far as the mind rests in the contemplation of a certain number of the elements of the world, as if they constituted a complete whole by themselves, whereas they are only a part, the conception of which has to be modified at the next step of considering its relation to the other parts. Thus we rise from individuals of the first to individuals of

¹ *Eth.*, I. schol. 29.

² *De Emend.*, viii. § 58.

the second order, and we cannot stop short of the idea of "all nature as one individual whose parts vary through an infinite number of modes, without change of the whole individual."¹ At first we think of pieces of matter as independent individuals, either because we can picture them separately, or because they preserve a certain proportion or relation of parts through their changes. But on further consideration, these apparent substances sink into modes, each of which is dependent on all the others. All nature is bound together by necessary law, and not an atom could be other than it is without the change of the whole world. Hence it is only in the whole world that there is any true individuality or substance. And the same principle applies to the minds of men. Their individuality is a mere semblance caused by our abstraction from their conditions. Isolate the individual man, and he will not display the character of a thinking being at all. His whole spiritual life is bound up with his relations to other minds, past and present. He has such a life, only in and through that universal life of which he is so infinitesimal a part that his own contribution to it is as good as nothing. "*Vis qua homo in existendo perseverat limitata est, et a potentia causarum externarum infinite superatur.*"² What can be called his own? His body is a link in a cyclical chain of movement which involves all the matter of the world, and which as a whole remains without change through all. His mind is a link in a great movement of thought, which makes him the momentary organ and expression of one of its phases. His very consciousness of self is marred by a false abstraction, above which he must rise ere he can know himself as he really is.

"Let us imagine," says Spinoza in his fifteenth letter, "a little worm living in blood which has vision enough to discern the particles of blood, lymph, &c., and reason enough to observe how one particle is repelled by another with which it comes into contact, or communicates a part of its motion to it. Such a worm would live in the blood as we do in this part of the universe, and would regard each particle of it, not as a part, but as a whole, nor could it know how all the parts are influenced by the universal nature of the blood, and are obliged to accommodate themselves to each other as is required by that nature, so that they co-operate together according to a fixed law. For if we suppose that there are no causes outside of the blood which could communicate new motions to it, and no space beyond the blood, nor any other bodies to which its particles could transfer their motion, it is certain that the blood as a whole would always maintain its present state, and its particles would suffer no other variations than those which may be inferred from the given relation of the motion of blood to lymph, chyle, &c. And thus in that case the blood would require to be considered always as a whole and not as a part. But since there are many other causes which influence the laws of the nature of blood, and are in turn influenced thereby, other motions and other variations must arise in the blood which are not due to the proportion of motion in its constituents but also to the relation between that motion and external causes. And therefore we cannot consider the blood as a whole, but only as a part of a greater whole."

"Now we can think, and indeed ought to think, of all natural bodies in the same manner in which we have thought of this blood, for all bodies the surrounded by other bodies, and reciprocally determine and are determined by them, to exist and operate in a fixed and definite way, so as to preserve the same ratio of motion and rest in the whole universe. Hence it follows that every body, in so far as it exists under a certain definite modification,

ought to be considered as merely a part of the whole universe, which agrees with its whole, and thereby is in intimate union with all the other parts; and since the nature of the universe is not limited like that of the blood, but absolutely infinite, it is clear that by this nature with its infinite powers, the parts are modified in an infinite number of ways, and compelled to pass through an infinity of variations. Moreover, when I think of the universe as a substance, I conceive of a still closer union of each part with the whole; for, as I have elsewhere shown, it is the nature of substance to be infinite, and therefore every single part belongs to the nature of the corporeal substance, so that apart therefrom it neither can exist nor be conceived. And as to the human mind, I think of it also as of part of nature, for I think of nature as having in it an infinite power of thinking, which, as infinite, contains in itself the idea of all nature, and whose thoughts run parallel with all existence."

From this point of view it is obvious that our knowledge of things cannot be real and adequate, except in so far as it is determined by the idea of the whole, and proceeds from the whole to the parts. A knowledge that proceeds from part to part must always be imperfect; it must remain external to its object, it must deal in abstractions or mere *entia rationis*, which it may easily be led to mistake for realities. Hence Spinoza, like Plato, distinguishes reason whose movement is regressive (from effect to cause, from variety to unity) from *scientia intuitiva*, whose movement is progressive, which "proceeds from the adequate idea of certain of God's attributes to an adequate knowledge of the nature of things."³ The latter alone deserves to be called science in the highest sense of the term. For in order that our mind may correspond to the exemplar of nature, it must develop all its ideas from the idea that represents the origin and source of nature, so that that idea may appear as the source of all other ideas."⁴ The regressive mode of knowledge has its highest value in preparing for the progressive. The knowledge of the finite, ere it can become perfectly adequate, must be absorbed and lost in the knowledge of the infinite. In a remarkable passage in the *Ethics*, Spinoza declares that the defect of the common consciousness of men lies not so much in their ignorance, either of the infinite or of the finite, as in their incapacity for bringing the two thoughts together, so as to put the latter in its proper relation to the former. All are ready to confess that God is the cause both of the existence and of the nature of things created, but they do not realize what is involved in this confession—and hence they treat created things as if they were substances, that is, as if they were Gods. "Thus while they are contemplating finite things, they think of nothing less than of the divine nature; and again when they turn to consider the divine nature, they think of nothing less than of their former fictions on which they have built up the knowledge of finite things, as if these things could contribute nothing to our understanding of the divine nature. Hence it is not wonderful that they are always contradicting themselves."⁵ As Spinoza says elsewhere, it belongs to the very nature of the human mind to know God, for unless we know God, we could know nothing else. The idea of the absolute unity is involved in the idea of every particular thing, yet the generality of men, deluded by sense and imagination, are unable to bring this implication into clear consciousness, and hence their knowledge of God does not modify their view of the finite. It is the business of philosophy to correct this defect, to transform our conceptions of the finite by relating it to the infinite, to complement and complete the partial knowledge

¹ *Eth.*, ii. lemma, 7 schol.² *Eth.*, iv. 2³ *Eth.*, ii. 40, schol. 2. ⁴ *De Emend.*, vii. § 42. ⁵ *Eth.*, ii. schol. 10.

produced by individual experience by bringing it into connection with the idea of the whole. And the vital question which Spinoza himself prompts us to ask is how far and in what way this transformation is effected in the Spinozistic philosophy.

There are two great steps in the transformation of knowledge by the idea of unity as that idea is conceived by Spinoza. The first step involves a change of the conception of individual finite things by which they lose their individuality, their character as independent substances, and come to be regarded as modes of the infinite. But secondly, this negation of the finite as such is not conceived as implying the negation of the distinction between mind and matter. Mind and matter still retain that absolute opposition which they had in the philosophy of Des Cartes, even after all limits have been removed. And therefore in order to reach the absolute unity, and transcend the Cartesian dualism, a second step is necessary, by which the independent substantiality of mind and matter is withdrawn, and they are reduced into attributes of the one infinite substance. Let us examine these steps successively.

The method by which the finite is reduced into a mode of the infinite has already been partially explained. Spinoza follows to its legitimate result the metaphysical or logical principles of Des Cartes and Malebranche. According to the former, as we have seen, the finite presupposes the infinite, and, indeed, so far as it is real, it is identical with the infinite. The infinite is absolute reality, because it is pure affirmation, because it is that which *negationem nullam involvit*. The finite is distinguished from it simply by its limit, i.e., by its wanting something which the infinite has. At this point Spinoza takes up the argument. If the infinite be the real, and the finite, so far as it is distinguished therefrom, the unreal, then the supposed substantiality or individuality of finite beings is an illusion. In itself the finite is but an abstraction, to which imagination has given an apparent independence. All limitation or determination is negative, and in order to apprehend positive reality, we must abstract from limits. By denying the negative, we reach the affirmative; by annihilating finitude in our thought, and so undoing the illusory work of the imagination, we reach the indeterminate or unconditioned being which alone truly is. All division, distinction, and relation are but *entia rationis*. Imagination and abstraction can give to them, as they can give to mere negation and nothingness, "a local habitation and a name," but they have no objective meaning, and in the highest knowledge, in the *scientia intuitiva*, which deals only with reality, they must entirely disappear. Hence to reach the truth as to matter, we must free ourselves from all such ideas as figure or number, measure or time, which imply the separation and relation of parts. Thus in his 50th letter, in answer to some question about figure, Spinoza says, "to prove that figure is negation, and not anything positive, we need only consider that the whole of matter conceived indefinitely, or in its infinity, can have no figure; but that figure has a place only in finite or determinate bodies. He who says that he perceives figure, says only that he has before his mind a limited thing and the manner in which it is limited. But this limitation does not pertain to a thing in its 'esse,' but contrariwise in its 'non-esse,' (i.e., it signifies, not that some positive quality belongs to the thing, but that something is wanting to it). Since, then, figure is but limitation, and limitation is but negation, we cannot say that figure is anything." The same kind of reasoning is elsewhere (*Epist.* 29) applied to solve the difficulties connected with the divisibility of space or extension. Really, according to Spinoza, extension is indivisible, though modally it is divisible. In other words, parts *ad infinitum* may be taken in space by the abstracting

mind, but these parts have no separate existence. You cannot round space, or take one part of it out of its connection with other parts. Hence arises the impossibility of asserting either that there is an infinite number of parts in space, or that there is not. The solution of the antinomy is that neither alternative is true. There are many things *quæ nullo numero explicari possunt*, and to understand these things we must abstract altogether from the idea of number. The contradiction arises entirely from the application of that idea to the infinite. We cannot say that space has a finite number of parts, for every finite space must be conceived as itself included in infinite space. Yet, on the other hand, an infinite number is an absurdity; it is a number which is not a number. We escape the difficulty only when we see that number is a category inapplicable to the infinite, and this to Spinoza means that it is not applicable to reality, that it is merely an abstraction, or *ens imaginativum*.

The same method which solves the difficulties connected with the nature of matter is applied to mind. Here also we reach the reality, or thing in itself, by abstracting from all determination. All conceptions, therefore, that involve the independence of the finite, all conceptions of good, evil, freedom, and responsibility disappear. When Blyenburgh accuses Spinoza of making God the author of evil, Spinoza answers that evil is an *ens rationis* that has no existence for God. "Evil is not something positive, but a state of privation, and that not in relation to the divine, but simply in relation to the human intelligence. It is a conception that arises from that generalizing tendency of our minds, which leads us to bring all beings that have the external form of man under one and the same definition, and to suppose that they are all equally capable of the highest perfection we can deduce from such a definition. When, therefore, we find an individual whose works are not consistent with this perfection, straightway we judge that he is deprived of it, or that he is diverging from his own nature,—a judgment we should never make if we had not thus referred him to a general definition, and supposed him to be possessed of the nature it defines. But since God does not know things abstractly, or through such general definitions, and since there cannot be more reality in things than the divine intelligence and power bestows upon them, it manifestly follows that the defect which belongs to finite things, cannot be called a privation in relation to the intelligence of God, but only in relation to the intelligence of man."¹ Thus evil and good vanish when we consider things *sub specie eternitatis*, because they are categories that imply a certain independence in finite beings. For the idea of a moral standard implies a relation of man to the absolute good, a relation of the finite to the infinite, in which the finite is not simply lost and absorbed in the infinite. But Spinoza can admit no such relation. In the presence of the infinite the finite disappears, for it exists only by abstraction and negation; or it seems to us to exist, not because of what is present to our thoughts, but because of what is not present to them. As we think ourselves free because we are conscious of our actions but not of their causes, so we think that we have an individual existence only because the infinite intelligence is not wholly but only partially realized in us. But as we cannot really divide space, though we can think of a part of it, so neither can we place any real division in the divine intelligence. In this way we can understand how Spinoza is able to speak of the human mind as part of the infinite thought of God, and of the human body as part of the infinite extension of God, while yet he asserts that the divine substance is simple, and not

¹ *Epist.* 32.

made up of parts. So far as they exist, they must be conceived as parts of the divine substance, but when we look directly at that divine substance, their separate existence altogether disappears.

It has, however, been already mentioned that this ascending movement of abstraction, does not at once and directly bring Spinoza to the absolute unity of substance. The principle that "determination is negation," and that therefore the absolute reality is to be found only in the indeterminate, would lead us to expect this conclusion; but the Cartesian dualism prevents Spinoza from reaching it. Mind and matter are so absolutely opposed, that even when we take away all limit and determination from both, they still retain their distinctness. Raised to infinity, they still refuse to be identified. We are forced, indeed, to take from them their substantial or substantive existence, for there can be no other substance but God, who includes all reality in himself. But though reduced to attributes of a common substance, the difference of thought and extension is insoluble. The independence of individual finite things disappears whenever we substitute thought for imagination, but even to pure intelligence, extension remains extension, and thought remains thought. Spinoza seems therefore reduced to a dilemma; he cannot surrender either the unity or the duality of things, yet he cannot relate them to each other. The only course left open to him is to conceive each attribute in its turn as the whole substance, and to regard their difference as the difference of expression. As the patriarch was called by the two names of Jacob and Israel, under different aspects, each of which included the whole reality of the man, so our minds apprehend the absolute substance in two ways, each of which expresses its whole nature.¹ In this way the extremes of absolute identity and absolute difference seem to be reconciled. There is a complete parallelism of thought and extension, *ordo et connexio idearum idem est ac ordo et connexio rerum*,² yet there is also a complete independence and absence of relation between them, for each is the whole. A thing in one expression cannot be related to itself in another expression. Hence in so far as we look at the substance under the attribute of thought, we must take no account of extension, and in so far as we look at it under the attribute of extension, we must equally refuse to take any account of thought. This parallelism may be best illustrated by Spinoza's account of the relation of the human soul and body. The soul is the idea of the body, and the body is the object of the soul, whatever is in the one really is in the other ideally; yet this relation of object and subject does not imply any connexion. The motions and changes of the body have to be accounted for partly by itself, partly by the influence of other bodies; and the thoughts of the soul in like manner have to be accounted for partly by what God thinks as constituting the individual mind, and partly by what he thinks as constituting the minds of other individuals. But to account for thought by the motions of the body, or for the motions of the body by thought, is to attempt to bridge the impassable gulf between thought and extension. It involves the double absurdity of accounting for a thing by itself, and of accounting for it by that which has nothing in common with it.

In one point of view, this theory of Spinoza deserves the highest praise for that very characteristic which probably excited most odium against it at the time it was first published, namely, its exaltation of matter. It is the mark of an imperfect spiritualism to hide its eyes from outward nature, and to shrink from the material as impure and defiling. But its horror and fear are proofs of weakness; it flies from an enemy it cannot overcome. Spinoza's

bold identification of spirit and matter, God and nature, contains in it the germ of a higher idealism than can be found in any philosophy that asserts the claims of the former at the expense of the latter. A system that begins by making nature godless, will inevitably end, as Schelling once said, in making God unnatural. The expedients by which Des Cartes keeps matter at a distance from God, were intended to maintain his pure spirituality; but their ultimate effect was seen in his reduction of the spiritual nature to mere will. As Christianity has its superiority over other religions in this, that it does not end with the opposition of the human to the divine, the natural to the spiritual, but ultimately reconciles them, so a true idealism must vindicate its claims by absorbing materialism into itself. It was therefore a true instinct of philosophy that led Spinoza to raise matter to the co-equal of spirit, and at the same time to protest against the Cartesian conception of matter as mere inert mass, moved only by impulse from without. "What were a God that only impelled the world from without?" says Goethe. "It becomes him to stir it by an inward energy, to involve nature in himself, himself in nature, so that that which lives and moves and has a being in him can never feel the want of his power or his spirit."

While, however, Spinoza thus escapes some of the inconsequences of Des Cartes, the contradiction that was implicit in the Cartesian system between the duality and the unity, the attributes and the substance, in his system becomes explicit. When so great emphasis is laid upon the unity of substance, it becomes more difficult to explain the difference of the attributes. The result is, that Spinoza is forced to account for it, not by the nature of substance itself, but by the nature of the intelligence to which it is revealed. "By substance," he says, "I understand that which is in itself, and is conceived through itself. By attribute I understand the same thing, *nisi quod attributum dicatur respectu intellectus substantie certum talem naturam tribuentis*."³ Hence we are naturally led with Erdmann to think of the intelligence dividing the substance as a kind of prism that breaks the white light into different colours, through each of which the same world is seen, only with a different aspect. But if the intelligence in itself is but a mode of one of the attributes, how can it be itself the source of their distinction?

The key to this difficulty is that Spinoza has really, and almost in spite of his logical principles, two opposite conceptions of substance, between which he alternates without ever bringing them to a unity. On the one hand, in accordance with the principle that determination is negation, substance must be taken as that which is utterly indeterminate, like the Absolute of the Buddhist, which we can characterize only by denying of it everything that we assert of the finite. In this view, no predicate can be applied univocally to God and to the creatures; he differs from them, not only in existence, but in essence.⁴ If we follow out this view to its legitimate result, God is withdrawn into his own absolute unity, and no difference of attributes can be ascribed to him, except in respect of something else than himself. It is owing to the defects of our intelligence that he appears under different forms or expressions; in himself he is pure being, without form or expression at all. But, on the other hand, it is to be observed, that while Spinoza really proceeds by abstraction and negation, he does not mean to do so. The abstract is to him the unreal and imaginary, and what he means by substance is not simply Being in general, the conception that remains when we omit all that distinguishes the particulars, but the absolute totality of things conceived as a unity in which all particular existence is included and subordinated.

¹ *Epist.*, 27.² *Eth.*, ii. 7.³ *Epist.*, 27.⁴ *Eth.*, i. schol. 17.

Hence at a single stroke the indeterminate passes into the most determinate Being, the Being with no attributes at all into the Being constituted by an infinite number of attributes. And while, under the former conception, the defect of our intelligence seemed to be that it divided the substance, or saw a difference of attributes in its absolute unity, under the second conception its defect lies in its apprehending only two out of the infinite multitude of these attributes. To do justice to Spinoza, therefore, we must distinguish between the actual effect of his logic and its effect as he conceived it. The actual effect of his logic is to dissolve all in the ultimate abstraction of Being, from which we can find no way back to the concrete. But his intent was simply to relate all the parts to that absolute unity which is the pre-supposition of all thought and being, and so to arrive at the most concrete and complete idea of the reality of things. He failed to see what is involved in his own principle that determination is negation; for if affirmation is impossible without negation, then the attempt to divorce the two from each other, the attempt to find a purely affirmative being, must necessarily end in the barest of all abstractions being confused with the unity of all things. But even when the infinite substance is defined as the negative of the finite, the idea of the finite becomes an essential element in the conception of the infinite. Even the Pantheist, who says that God is what finite things are not, in spite of himself recognizes that God has a relation to finite things. Finite things may in his eyes have no positive relation to God, yet they have a negative relation; it is through their evanescence and transitoriness, through their nothingness, that the eternal, the infinite reality alone is revealed to him. Spinoza is quite conscious of this process, conscious that he reaches the affirmation of substance by a negation of what he conceives as the purely negative and unreal existence of finite things, but as he regards the assertion of the finite as merely an illusion due to our imagination, so he regards the correction of this illusion, the negation of the finite as a movement of reflection which belongs merely to our intelligence, and has nothing to do with the nature of substance in itself. We find the true affirmation by the negation of the negative, but in itself affirmation has no relation to negation. Hence his absolute being is the dead all-absorbing substance and not the self-revealing spirit. It is the being without determination, and not the being that determines itself. There is no reason in the nature of substance why it should have either attributes or modes; neither individual finite things nor the general distinction of mind and matter can be deduced from it. The descending movement of thought is not what Spinoza himself said it should be, an evolution, but simply an external and empirical process by which the elements dropped in the ascending movement of abstraction are taken up again with a merely nominal change. For the sole difference in the conception of mind and matter as well as in the conception of individual minds and bodies which is made by their reference to the idea of God, is that they lose their substantive character and become adjectives. Aristotle objected to Plato that his ideas were merely *αλογητά αἰδέα*, that is, that his idealization of the world was merely superficial, and left the things idealized very much what they were before to the sensuous consciousness; and the same may be said of Spinoza's negation of finite things. It was an external and imperfect negation, which did not transform the idea of the finite, but merely substituted the names of attributes and modes for the names of general and individual substances.

The same defective logic, by which the movement of thought in determining the substance is regarded as altogether external to the substance itself, is seen again

in Spinoza's conceptions of the relations of the attributes to each other. Adopting the Cartesian opposition of mind and matter, he does not see, any more than Des Cartes, that in their opposition they are correlative. Or if he did see it (as seems possible from a passage in his earliest treatise),¹ he regarded the correlation as merely subjective, merely belonging to our thought. They are to him only the two attributes which we happen to know out of the infinite number belonging to God. There is no necessity that the substance should manifest itself in just these attributes and no others, for abstract substance is equally receptive of all determinations, and equally indifferent to them all. Just because the unity is merely generic, the differences are accidental, and do not form by their union any complete whole. If Spinoza had seen that matter in itself is the correlative opposite of mind in itself, he need not have sought by abstracting from the difference of these elements to reach a unity which is manifested in that very difference, and his absolute would have been not substance but spirit. This idea he never reached, but we find him approximating to it in two ways. On the one hand, he condemns the Cartesian conception of matter as passive and self-external, or infinitely divisible—as, in short, the mere opposite of thought.² And sometimes he insists on the parallelism of extension and thought at the expense of their opposition in a way that almost anticipates the assertion by Leibnitz of the essential identity of mind and matter. On the other hand, he recognizes that this parallelism is not complete. Thought is not like a picture; it is conscious, and conscious not only of itself, but of extension. It transcends therefore the absolute distinction between itself and the other attributes. It is only because he cannot rid himself of the phantom of an extended matter as a thing in itself, which is entirely different from the idea of it, that Spinoza is prevented from recognizing in mind that unity that transcends all distinctions, even its own distinction from matter. As it is, his main reason for saying that intelligence is not an attribute of God, but merely a mode, seems to be this, that the thought of God must be conceived as producing its own object, i.e. as transcending the distinction of subject and object which is necessary to our intelligence.³ But this argument of itself points to a concrete quite as much as to an abstract unity. It is as consistent with the idea of absolute spirit as with that of absolute substance. Spinoza's deliberate and formal doctrine is undoubtedly the latter; but he constantly employs expressions which imply the former, as when he speaks of God as *causa sui*. The higher idea inspires him, though his consciousness only embraces the lower idea.

The ethical philosophy of Spinoza is determined by the same principles and embarrassed by the same difficulties as his metaphysics. In it also we find the same imperfect conception of the relation of the positive to the negative elements, and as a consequence, the same confusion of the highest unity of thought, the affirmation that subordinates and transcends all negation with mere abstract affirmation. Or, to put the same thing in ethical language, Spinoza teaches a morality which is in every point the opposite of asceticism, a morality of self-assertion or self-seeking, and not of self-denial. The *conatus sese conservandi* is to him the supreme principle of virtue;⁴ yet this self-seeking is supposed, under the guidance of reason, to identify itself with the love of man and the love of God, and to find blessedness not in the reward of virtue, but in virtue itself. It is only confusion of thought and false mysticism that could object to this result on the ground of the element of self still preserved in the *amor Dei intellectualis*. For

¹ *Tractatus de Deo et homine*, II. 19.

² *Epist.*, 29, 70.

³ *Eth.*, I. schol. 17.

⁴ *Eth.*, IV. schol. 22.

it is just the power of identifying himself with that which is wider and higher than his individual being that makes morality possible to man. But the difficulty lies in this, that Spinoza will not admit the negative element, the element of mortification or sacrifice, into morality at all, even as a moment of transition. For him there is no dead self, by which we may rise to higher things, no losing of life that we may find it. For the negative is nothing, it is evil in the only sense in which evil exists, and cannot be the source of good. The higher affirmation of our own being, the higher seeking of ourselves which is identical with the love of God, must therefore be regarded as nothing distinct in kind from that first seeking of our natural self which in Spinoza's view belongs to us in common with the animals, and indeed in common with all beings whatever. It must be regarded merely as a direct development and extension of the same thing. The main interest of the Spinozistic ethics therefore lies in observing by what steps he accomplishes this transition, while excluding altogether the idea of a real division of the higher and the lower life, the spirit and flesh, and of a conflict in which the former is developed through the sacrifice of the latter.

Finite creatures exist only as modes of the divine substance, only so far as they partake in the infinite, or what is the same thing with Spinoza, in the purely affirmative or self-affirming nature of God. They therefore must also be self-affirming. They can never limit themselves; their limit lies in this, that they are not identified with the infinite substance which expresses itself also in other modes. In other words, the limit of any finite creature, that which makes it finite, lies without it, and its own existence, so far as it goes, must be pure self-assertion and self-seeking. *Unaqueque res quantum in se est in suo esse perseverare conatur*, and this *conatus* is its very essence or inmost nature.¹ In the animals this *conatus* takes the form of appetite, in man of desire, which is "appetite with the consciousness of it."² But this constitutes no essential difference between appetite and desire, for "whether a man be conscious of his appetite or no, the appetite remains one and the same thing."³ Man therefore, like the animals, is purely self-asserting and self-seeking. He can neither know nor will anything but his own being, or if he knows or wills anything else, it must be something involved in his own being. If he knows other beings, or seeks their good, it must be because their existence and their good are involved in his own. If he loves and knows God it must be because he cannot know himself without knowing God, or find his supreme good anywhere but in God.

What at first makes the language difficult to us is the identification of will and intelligence. Both are represented as affirming their objects. Des Cartes had prepared the way for this when he treated the will as the faculty of judging or giving assent to certain combinations of ideas, and distinguished it from the purely intellectual faculties by which the ideas are apprehended. By this distinction he had, as he supposed, secured a place for human freedom. Admitting that intelligence is under a law of necessity, he claimed for the will a certain latitude or liberty of indifference, a power of giving or withholding assent in all cases where the relations of ideas were not absolutely clear and distinct. Spinoza points out that there is no ground for such a distinction, that the acts of apprehension and judgment cannot be separated from each other. "In the mind there is no volition, i.e., no affirmation or negation which is not immediately involved in the idea it apprehends" and therefore "intellect and will are one and the same thing."⁴ If then there is no freedom except the

liberty of indifference, freedom is impossible. Man, like all other beings and things, is under an absolute law of necessity. All the actions of his will, as well as of his intelligence, are but different forms of the self-assertive tendency to which he cannot but yield, because it is one with his very being, or only ideally distinguishable therefrom. There is, however, another idea of liberty. Liberty as the opposite of necessity is an absurdity—it is impossible for either God or man; but liberty as the opposite of slavery is possible, and it is actually possessed by God. The divine liberty consists in this, that God acts from the necessity of his own nature alone, and is not in any way determined from without. And the great question of ethics is, How far can man partake in this liberty? At first it would seem impossible that he should partake in it. He is a finite being, whose power is infinitely surpassed by the power of other beings to which he is related. His body acts only as it is acted on, and his mind cannot therefore apprehend his body, except as affected by other things. His self-assertion and self-seeking are therefore confused with the asserting and seeking of other things, and are never pure. His thought and activity cannot be understood except through the influence of other things which lie outside of his consciousness, and upon which his will has no influence. He cannot know clearly and distinctly either himself or anything else; how then can he know his own good or determine himself by the idea of it?

The answer is the answer of Des Cartes, that the apprehension of any finite thing involves the adequate idea of the infinite and eternal nature of God.⁵ This is the primary object of intelligence, in which alone is grounded the possibility of knowing either ourselves or anything else. In so far as our knowledge is determined by this idea, or by the ideas of other things, which are referred to this idea and seen in its light, in so far its action flows from an internal and not an external necessity. In so far, on the other hand, as we are determined by the affections of the body, ideas in which the nature of our own body and the nature of other things are confused together, in so far we are determined by an external necessity. Or to put the same thing in what has been shown to be merely another way of expression, in so far as we are determined by pure intelligence we are free, but in so far as we are determined by opinion and imagination we are slaves.

From these premises it is easy to see what form the opposition of reason and passion must necessarily take with Spinoza. The passions belong to our nature as finite; they are grounded on, or rather are but another form of inadequate ideas; but we are free only in so far as our ideas either immediately are, or can be made, adequate. Our idea of God is adequate *ex videri*; our ideas of the affections of our body are inadequate, but can be made adequate in so far as they are referred to the idea of God. And as the idea of God is purely affirmative, this reference to the idea of God implies the elimination of the negative element from the ideas of the affections of the body, "for nothing that is positive in a false idea is removed by the presence of truth as such."⁶ Brought into contact with the idea of God, all ideas become true and adequate, by the removal of the negative or false element in them. The idea of God is, as it were, the touch-stone which distinguished the gold from the dross. It enables us to detect the higher spiritual element in the natural passions, and to sever the element belonging to that pure love of self which is identical with the love of perfection from the elements belonging to that impure love of our own finite individuality as such which is identical with the love of evil.

¹ *Eth.*, iii. 6, 7.² *Eth.*, iii. Def. Affect. 1.³ *Eth.*, iii. 9.⁴ *Eth.*, ii. 49.⁵ *Eth.*, ii. 45.⁶ *Eth.*, iv. 1.

The imperfection in Spinoza's development of this principle has already been indicated. It is in fact the same imperfection which runs through his whole system. Just as he supposed that the ideas of finite things were at once made consistent with the idea of the infinite when he had named them modes, so here his conception of the change through which selfish natural desire must pass in order to become spiritual is far too superficial and external. Hence he has no sympathy with asceticism, but treats it, like Bentham, as a *torva et tristis superstitio*. Joy is the "transition from less to greater perfection," and cannot be but good; pain is the "transition from greater to less perfection," and cannot be but evil. The revolt against the mediæval opposition of the nature and spirit is visible in many of his sayings. "No Deity who is not envious can delight in my weakness or hurts, or can regard as virtues those fears and sighs and tears which are the signs of the mind's weakness; but contrariwise, the greater is our joy, the greater is our progress to perfection, and our participation in the divine nature."¹ "A free man thinks of nothing less than death, his wisdom is a meditation not of death but of life."² The same idea, combining with the idea of necessity, leads him to condemn repentance and pity, as well as pride and humility. Unconsciously, Spinoza reproduces the principle of asceticism, while in words he utterly rejects it. For though he tells us that pure self-complacency is the highest thing we can hope, yet from this self-complacency all regard to the finite individuality of the subject is eliminated. *Qui Deum amat, conari non potest ut Deus ipsum contra amet*. In like manner, he absolutely condemns all hatred, envy, rivalry, and ambition, as springing out of an over-estimate of those finite things which one only can possess, while the highest good is that which is enjoyed the more easily and fully the greater the number of participants. Yet Spinoza's exaltation of the social life, and of the love that binds it together, is too like the Buddhist's universal charity that embraces all creatures, and all creatures equally. Both are based on an abstraction from all that is individual, only the Buddhist's abstraction goes a step further, and erases even the distinction between man and the animals. Spinoza felt the pressure of this all-levelling logic when he said, "I confess I cannot understand how spirits express God more than the other creatures, for I know that between the finite and the infinite there is no proportion, and that the distinction between God and the most excellent of created things differs not a whit from the distinction between him and the lowest and meanest of them."³ As Pope said, God is "as full and perfect in a hair as a heart;" in all finite things there is a ray of divinity, and in nothing more than a ray. Yet in another epistle, Spinoza contradicts this view, and declares that, while he does not consider it necessary to "know Christ after the flesh, he does think it necessary to know the eternal Son of God, i.e., God's eternal wisdom, which is manifested in all things, but chiefly in the mind of man, and most of all in Christ Jesus."⁴ In the *Ethics* the distinction of man and the animals is treated as an absolute distinction, and it is asserted with doubtful consistency that the human soul cannot all be destroyed along with the body, for that there is something of it which is eternal. Yet from this eternity we must of course eliminate all notion of the consciousness of the finite self as such. At this point, in short, the two opposite streams of Spinoza's thought, the positive method he intends to pursue, and the negative or abstracting method he really does pursue, meet in irreconcilable contradiction. The finite must be related to the infinite so as to preserve all that is in it of reality; and therefore its limit or the negative element in it must be abstracted from. But it turns out that with this ab-

straction from the existence of the finite, the positive also disappears, and God is all in all in a sense that absolutely excludes the existence of the finite. "The mind's intellectual love of God," says Spinoza, "is the very love wherewith God loves himself, not in so far as he is infinite, but in so far as he can be expressed by the essence of the human mind, considered under the form of eternity; i.e., the mind's intellectual love of God is part of the infinite love wherewith God loves himself."⁵ This double "in so far," which returns so frequently in Spinoza, just conceals for a moment the contradiction of two streams of thought, one of which must be swallowed up by the other, if they are once allowed to meet.

We have now reviewed the main points of the system, which was the ultimate result of the principles of Des Cartes. The importance of this first movement of modern philosophy lies in its assertion and exhibition of the unity of the intelligible world with itself and with the mind of man. In this point of view, it was the philosophical counterpart of Protestantism; but like Protestantism in its earliest phase, it passed rapidly from the doctrine that God is, without priest or authority, present to man's spirit, to the doctrine that man's spirit is as nothing before God. The object seemed too powerful for the subject, who effaced himself before God that he might be strong towards men. But in this natural movement of feeling and thought it was forgotten that the God that effaced the world and the finite spirit by his presence could not be a living God. Spinoza gives the ultimate expression to this tendency, and at the same time marks its limit, when he says that whatever reality is in the finite is of the infinite. But he is unsuccessful in showing that, on the principles on which he starts, there can be any reality in the finite at all. Yet even if the finite be a delusion, still more if it be better than a delusion, it requires to be accounted for. Spinoza accounts for it neither as illusory nor as real. It was reserved for the following generation of philosophers to assert, in different ways, the reality of the finite, the value of experience, and the futility of abstractions. Spinoza had declared that true knowledge consists in seeing things under the form of eternity, but it is impossible that things can be seen under the form of eternity unless they have been first seen under the form of time. The one-sided assertion of individuality and difference in the schools of Locke and Leibnitz, was the natural complement of the one-sided assertion of universality and unity in the Cartesian school. But when the individualistic tendency of the 18th century had exhausted itself, and produced its own refutation in the works of Kant, it was inevitable that the minds of men should again turn to the great philosopher, who, with almost perfect insight working through imperfect logic, first formulated the idea of a unity presupposed in and transcending the difference of matter and mind, subject and object.

See the Histories of Philosophy, especially those by Hegel, Feuerbach, Erdmann, and Fischer; F. Bouillier, *Histoire de la Philosophie Cartésienne*, 1854; Ollé-Laprun, *Philosophie de Malebranche*; E. Saisset, *Praecurseurs et Disciples de Descartes*, 1862. The German treatises on Spinoza are too numerous to mention. Jacobi's *Letters on Spinoza*, which were the beginning of a true interpretation of his philosophy, are still worth reading. We may also mention C. Schaarschmidt, *Descartes und Spinoza*, 1850; C. Sigwart, *Spinoza's neuentdeckter Tractat von Gott, dem Menschen, und dessen Glückseligkeit*, 1866. Both these writers have published German translations of the *Tractatus de Deo*. See also Tiedemann, *Historische Beiträge zur Philosophie*, 1867; R. Avenarius, *Ueber die beiden ersten Phasen des Spinozischen Pantheismus*, 1868; M. Joel, *Zur Genesis der Lehre Spinoza's*, 1871; R. Willis, *Enedict de Spinoza: his Ethics, Life, and Influence on Modern Religious Thought*, 1870. For biographical particulars, see the articles DES-CARTES, MALEBRANCHE, SPINOZA. (E. C.)

¹ *Eth.*, iv. schol. 45. ² *Eth.*, iv. 67. ³ *Epist.*, 57. ⁴ *Epist.*, 21.

CARTHAGE was situated on the north coast of Africa, not far from the modern city of Tunis, just at that point where the coast approaches most nearly to the Island of Sicily. It lay in the heart of the Bay of Tunis, close to the mouth of the River Bagradas, and its site was so favourable to the natural development of a city that a hundred years after its entire destruction by the Romans it was chosen with Corinth as a place for colonization by Julius Cæsar, and rose into distinction as the third town in the empire. It was a colony of the Phœnicians, and was founded about the middle of the 9th century B.C., a hundred years before the foundation of Rome. This is not the place to discuss the position of Phœnicia in history, even if there existed sufficient material to do so with satisfactory results. The Phœnicians have generally been regarded as a purely commercial nation, forming a connecting link between the nations of antiquity, distributing the elements of culture, but producing little or no addition to the common stock. A fuller examination of Phœnician and Assyrian remains may serve to show us that this view needs correction. It is probable that a nation which gave its language to the Hebrews, and its alphabet to the Greeks, and which, after profoundly influencing both these factors of modern civilization, consolidated an empire which for four hundred years held its own against the preponderance of Greece and Rome, possessed a greater individuality of development than has been usually accorded to it. Phœnicians have had the misfortune of being for the most part described by their enemies. We must receive with caution the accounts given us by the Jews of Canaanitish cruelty, or by the Romans of Carthaginian dishonesty. The relations of native historians both of the mother-city and of her chief colony have come down to us in a garbled and fragmentary form. Our best hope of more perfect knowledge lies in the deciphering of contemporary inscriptions.

The name Carthago (the city was called Karthada by the Phœnicians, and *Καρχήδων* by the Greeks) signifies New City. The inhabitants called themselves Canaanites, or inhabitants of the plain. The Romans used the name Pœni or Punici, the Latin form of *φόνικες*, which either signifies "red men," or refers to the palms which were the chief products, and the principal emblem of the Syrian coast. We gather from this that the first knowledge of Phœnicians was gained by the Romans from the Greeks, but the name Sarranus given to Phœnician wares, and the name Carthago itself, shows us that their knowledge of the chief products of Syrian merchandize, and of the existence of their rival city, was gained independently. Carthage was the youngest Phœnician colony founded in the territory, which she afterwards subdued. Utica, Tunis, and Hadrumetum lay close to her in the district of Zeugitana, Hippo a short distance to the west, Leptis to the east. As these towns, with the exception of Utica, eventually became subject to her, she rose like Rome on the ruins of older towns, and she owed her success to the same cause,—the possession of a situation of superior commercial capabilities. We propose to give first a sketch of the history, next of the constitution, and lastly of the topography of the city.

The history of ancient Carthage divides itself naturally into three periods:—the first extends from about 850 to 410 B.C., from the foundation of the city to the beginning of the wars with Syracuse; the second from 410 to 265 B.C., the beginning of the wars with Rome; the third from the commencement of the Roman (or Punic) wars till the destruction of the city, 146 B.C. It will then remain to remark the fortunes of the restored city until its destruction by the Arabs in 638 A.D. The first period of four centuries and a half contains the rise of the Carthaginian dominion and the culmination of its prosperity. Her empire was extended from the Straits of Gibraltar to the altars of the

Philæni, near the Great Syrtis, where she touched on the territory of Cyrene. She possessed as provinces Sardinia, the Balearic Islands, and Malta, and a few settlements in Spain and Gaul. She had subdued the neighbouring states founded from Phœnicia with the exception of Utica, and drew a large revenue from the corn lands of Byzacium and Emporia, situated on the coast south-east of the city. In Africa her subjects consisted of three classes—(1) Liby-Phœnicians, (2) Libyans, and (3) Nomads. The first were of a mixed race, the product of intermarriages between the native Libyans and the Carthaginians or earlier settlers from Phœnicia. They cultivated the fields of Zeugitana, but were regarded with suspicion by the Carthaginians of pure blood. The Libyans, although completely subdued by Carthage, were of an entirely different race, and to a great extent did not understand the Punic language. At first they received a rent from the new settlers for the ground they occupied, but this was afterwards refused. They formed the staple of the Carthaginian army. Entire difference of race made it impossible for the new settlers to amalgamate with the original inhabitants, and the hard treatment they received led them to join the mercenaries in a revolt against their masters. Outside these limits the rest of the territory of Carthage was occupied by Nomads, who owed her a loose allegiance. They supplied her with mercenary troops, especially cavalry; but their fidelity could not be depended upon, and the Romans finally subdued Carthage by their assistance. Among these Nomad tribes were situated various cities, colonized partly from Carthage and partly from the mother-country. Towards the south the dominion of Carthage extended as far as Lake Tritonis, connected by a canal with the Lesser Syrtis.

The foreign conquests of Carthage were undertaken with the object of securing her commerce. Justin tells us of a king, Malchus (the Latin form of the royal title), who after successes in Africa and Sicily was defeated in Sardinia, and turned his arms against his country. He must have lived between 600 and 550 B.C. A more historical personage is his successor Mago (between 550 and 500 B.C.), said to be the founder of the military power of the Carthaginians. His sons were Hasdrubal and Hamilcar, his grandsons Hannibal, Hasdrubal, and Sappho, sons of Hasdrubal, and Himilco, Hanno, and Gisco, sons of Hamilcar. By the energy of this family the Carthaginian empire was established over Sardinia, which was not lost till after the first Punic war, over the Balearic Islands and part of Sicily, and over portions of Liguria and Gaul. There are, however, few events of which the chronology is certain. The first is the sea fight between the Etruscans and Carthaginians on the one hand and the Phocæans of Aleria in Corsica on the other, which occurred in 536 B.C. The Phocæans, driven from Asia Minor by Harpagus in 564, had settled at Aleria or Alalia in Corsica, but engaged in piracy, which demanded the interference of the commercial naval powers. The Phocæans won the battle, but with such loss that they abandoned Corsica, and settled at Velia in Italy. Polybius has preserved three treaties between Carthage and Rome, the first of which belongs to the year 509 B.C., the second probably to the period between 480 and 410 B.C. Their object is to restrict Roman commerce in Punic waters, and it is noticeable that the second treaty prescribes stricter limits than the first, and testifies to a considerable superiority of Carthage over Rome. To the period of about 500 B.C. belong the expeditions of Hanno and Himilco,—the one to found colonies on the west coast of Africa, which was probably explored as far as the mouths of the Senegal and Gambia, the other to obtain a knowledge of the Atlantic, which resulted in the discovery of Britain. But the most important event of the

first period was the battle of Himera, fought between Hamilcar and Gelo of Syracuse, about the year 480 B.C. Terillus, tyrant of Himera, on the north coast of Sicily, driven out by Thero of Agrigentum, implored and obtained help from the Carthaginians. Thero was assisted by Gelo of Syracuse. An account of this battle is given by Herodotus. The forces of Hamilcar consisted of 3000 ships and 300,000 men,—Phoenicians, Libyans, Iberians, Ligurians, Helysci (perhaps Volscians), Sardinians, and Corsicans. He was defeated with great loss. For seventy years the Carthaginians made no further effort for the subjugation of Sicily. This battle is one of the most important in ancient history. The expedition in which it terminated was undertaken in conjunction with that of the Persians against the Greeks of Attica. The nearly simultaneous defeats of Himera and Salamis decided the question whether Semitic or Aryan nations should hold the empire of the West. The only other events of any importance in this period, of which we have an account, are the more complete subjugation of the African dependencies by the family of Mago, and the settlement of the disputed boundary between Carthage and Cyrene.

The second period of 140 years (410–269 B.C.) is occupied with the attempts of Carthage to reduce Sicily to the condition of a subject province. At this time her settlements were confined to the eastern corner of the island, while on the western coast Syracuse undertook the defence of Grecian nationality, and waged the battle of Aryans against Semites, until both combatants fell before the supremacy of Rome. The repulse of the Athenians from Syracuse, and the same rivalry between Egesta and Selinus which had invited Athenian interference in the affairs of the island, induced the Carthaginians to renew an enterprise which had been interrupted for seventy years. Hannibal, son of Gisco, stormed Selinus, and avenged at Himera the death of his grandfather. Overtures of peace were rejected, and preparations made for a more vigorous attack. In 406 Hannibal and Himilco destroyed the great city of Agrigentum, overthrew the mighty columns of her temples, and covered a flourishing site with a mass of ruins. Hannibal died before Agrigentum; Himilco proceeded to attack Gela. Syracuse was now governed by Dionysius, who from an obscure position had raised himself to the rank of despot. In 405 a treaty made by Carthage secured to her the possession of her conquests, and to Dionysius a firmer position on the throne. But he no sooner felt himself secure than he hastened to drive the enemy from the island. War broke out in 398, all Sicily fell before the Punic arms, and Dionysius, driven by Himilco to take refuge within the walls of Syracuse was there besieged. Pestilence came to his assistance, and the Carthaginians were defeated; 150,000 Punic corpses lay unburied on Grecian soil; and Himilco, unable to bear the contempt of his fellow-citizens, starved himself to death. The Libyans rose in rebellion, and Carthage was threatened by an army of 200,000 men. The attempt of Mago between 396 and 392 to procure a more favourable result had little effect. Ten years afterwards he led another expedition. The defeat of Cabala nearly lost the possession of the whole of Sicily, but the brilliant victory of Corsica restored the balance, and the Halyeus was accepted as the boundary between the two peoples. Fourteen years of peace ensued. In 368 the misfortunes of Carthage encouraged Dionysius to a new but unsuccessful effort to complete the purpose of his life. His death put an end to a renewal of the attempt, and his son and successor made peace with the Carthaginians. The weak government of Dionysius II. was favourable to the extension of Carthaginian empire in Sicily; but they found an antagonist of different mettle in the Corinthian Timoleon, who, after liberating Syracuse

from its tyrants, made war against Carthage for six years (345–340 B.C.). The defeat of the Crimissus (340 B.C.) was most crushing. The Holy Legion, composed of 2500 of the best families of Carthage, was destroyed, and the host of mercenaries cut to pieces. Peace restrained the Carthaginians within their old boundary of the Halyeus; the Greek cities were declared free; and Carthage promised never again to support a despot in Syracuse. The next thirty years contain little of note except trace of friendly intercourse between Carthage and Rome, and a record of assistance given to the Tyrians when besieged by Alexander the Great. She, however, sent ambassadors to Babylon to congratulate the conqueror on his return from Asia. Agathocles was the first to discover that the secular enemies of his countrymen were vulnerable in Africa. After becoming despot of Syracuse, and establishing his authority over the great towns in Sicily, he found that he had to reckon with the Carthaginians. Unsuccessful in the island, he transferred his forces to the mainland in 310, reduced Carthage to the last extremities, and would probably have obtained more signal success had not the revolt of Agrigentum called him home. Peace made in 306 continued till the death of Agathocles in 289. His loss encouraged the extension of Punic dominion, and at last obliged the Syracusans to call in the assistance of Pyrrhus, the chivalrous king of Epirus. He left Italy in 277, and in a short time drove the Carthaginians from the west and besieged them in the distant fortress of Lilybæum. But his allies were untrue to him—Carthage and Rome were leagued against him; he left Sicily in 276, and his departure from Italy in the following year left the Carthaginians to stand in sharp antagonism to the Latin branch of the Aryan stock.

The third period of Carthaginian history extends from 264 to 146 B.C.,—from the outbreak of the first war with Rome to the final annihilation of the city by the conquerors. This is not the place for a detailed account of the Punic wars, which occupy a large space in every Roman history. We must content ourselves with a hasty summary. The first war, which lasted from 264 to 241 B.C., was a contest for the possession of Sicily. The Carthaginians in undertaking it felt secure of their mastery over the sea. Their ambassadors told the Romans that they could not even wash their hands in the sea without permission of the Carthaginians. Montesquieu considers it one of the chief causes of the rise of Roman greatness that they were careful to borrow from their enemies whatever was calculated to improve their own efficiency. The Romans not only built a fleet but developed a novelty of tactics which precisely secured the object which they had in view. They were encouraged to further exertion by the victories of 260 B.C. and 256 B.C., and were schooled to caution by the defeat of the following year. The war was ended by the brilliant success of Catulus in 242 B.C., and Sicily was lost to the Carthaginians. The next three years and a half (241–237) were occupied by a civil war, which shows us on what insecure foundations the power of Carthage was based. The large army of mercenaries which had been employed against Rome was incautiously admitted into the city. Under pretence of demanding pay they rose against their employers, and were joined by the Libyans and Numidians, who cultivated the surrounding lands in unwilling subjection. The insurrection was quelled with difficulty, but a similar revolution in Sardinia was more successful; 700 Carthaginians were barbarously murdered, and the possession of the island passed to the Romans. All we know of the twenty years which elapsed before the beginning of the second war with Rome is confined to the successes of Hamilcar and his family in Spain. In 218 B.C. Hannibal, who had sworn as a boy eternal enmity to

the Romans, began the enterprize to which he devoted his life. His object was not so much to conquer Italian soil or Italian cities as to break up the confederacy on which the greatness of Rome depended, and to undo the fabric of its empire stone by stone. He sought, therefore, on the one hand to rouse Greeks and Orientals to a joint attack against the common foe, and on the other to sow dissension amongst the Latin, Sabellian, and Oscan tribes, and to urge them to reduce Rome to that position of comparative inferiority which she had occupied many centuries before. Both these plans failed. Hannibal was badly supported from home; he found that to combine in unity the shifting policy of the East was to weave a rope of sand; and he discovered above all that Roman supremacy was established on a basis of complete security. How different was her position, seated among kindred peoples bound to her by affinities of blood and language as well as interest, governed by the wise policy of a patriotic senate, and restrained by the overpowering force of devoted legions, and that of the city of merchants, tormented by factious, surrounded by alien and even hostile tribes, defected by mercenaries, and swayed by interest and passion. The defeat of Hasdrubal at the Metaurus in 207 B.C. crushed the last hope of the invader; Spain was recovered by the genius of Scipio, and in 203 B.C. Hannibal, not unwillingly, obeyed the order to embark from Italy to retard the ruin of his country which it was too late to save. The battle of Zama in 202 put an end to the war in the following year. It was due to the magnanimity of Scipio and Hannibal that peace was concluded on such terms that, while Rome had no longer to fear Carthage as a rival, she was content to recognize her existence as a commercial community.

For the next six years Hannibal governed the city which he had not been able to preserve. He reformed the constitution in a democratical sense, and paid with surprising facility the enormous indemnity demanded by Rome. He was engaged in planning a combination against Rome with Antiochus of Syria, when he was driven from power, and forced to take refuge in the East. Shortly afterwards he fell a victim to Roman hatred.

The interval between 183 and 150 B.C. contains little besides the history of internal dissensions,—struggles between the Roman party, the democratical party, and the party of Masinissa, which tore the city in sunder by their quarrels. The so-called third Punic war (149–146 B.C.) is one of the saddest events in all history, and the greatest blot on the reputation of the Romans. Jealousy of their old antagonists had been shown by constant acts of injustice, and at last the sight of the prosperity and riches of the city impressed upon the narrow mind of Cato the conviction that Carthage must be blotted out. A pretext for war was wantonly invented. The anxieties of the Carthaginians to secure peace at any sacrifice was made the instrument of their destruction. When they saw that their ruin was resolved upon, and that compromise was hopeless, they defended themselves with an energy which would have saved them at an earlier period. The sentence of the senate was ruthlessly carried out. The city burned for seventeen days, and concealed its very site under a heap of ashes. The plough was passed over it, and the ground was cursed for ever. In the words of Mommsen, "where the industrious Phœnicians bustled and trafficked for five hundred years, Roman slaves henceforth pastured the herds of their distant masters."

The history of Roman Carthage must be given in a few words. In 122 B.C. Cains Gracchus led 6000 colonists to Africa, and founded the city of Junonia. The colony did not prosper. In 25 B.C. a second colony was sent out by Augustus in fulfilment of a design of Julius Cæsar. This became so prosperous that Herodian states that it disputed

with Alexandria the second place in the empire. In the middle of the 5th century it became, under Genseric, the capital of the Vandal kingdom, and in 533 A.D. it was stormed by Belisarius. In 706 A.D. it was entirely destroyed by the general of the caliph Abdulmelek.

The constitution of Carthage was essentially aristocratical. The little we know of it is derived from a single chapter in the *Politics* of Aristotle (ii. 8), a few scattered passages in the same treatise, and in Polybius, Livy, Nepos, and other authors. The official heads of the Government were the suffetes (Heb. *Sophetim*), who are compared to the Roman consuls and the Spartan kings; they may only have been two in number, and probably held office for a year, but were capable of re-election. Under them was the senate, which may or may not have been divided into two houses. These offices were filled by popular election, determined by the joint claims of wealth and merit, but bribery was largely practised, and Aristotle goes as far as to say that the chief offices were objects of sale and purchase. The people had a voice in the conduct of affairs, but they were not consulted if the suffetes and the senate were agreed on a course of action. There is no reason to suppose with Grote that the public banquets mentioned by Aristotle were part of the machinery of bribery. The history of England (which by some writers is spoken of as the modern Carthage) supplies us with ample examples of an aristocratical government carried on under the forms of a democracy. By the side of the regular Government stood a controlling power which gradually absorbed into itself all the authority of the state. The *pentarchies* were probably bodies of commissioners chosen from the principal families, self-elected, and so constituted that the outgoing members preserved their power for another year, and thus impressed a unity of policy on the institution. By these were elected the council of a hundred (or more strictly a hundred and four), who stood in the same relation to the suffetes as the ephors to the Spartan kings. By the gradual extension of judicial functions, like the parliaments of France, they usurped to themselves the authority of the state. To them is to be referred the cruel vengeance so often wreaked on unsuccessful generals. It was the work of Hannibal to diminish the authority of this body, and to secure a more real share of power to the people.

The Carthaginians were, like the Phœnicians, a deeply religious people. Religion entered into every important action of their lives, and their priests were held in the highest honour, yet there was no special order of priests, and we have no proof that the office was by law or custom confined to any particular family. Aristotle, writing more than half a century before the first Punic war, gives great praise to the Carthaginian constitution on the score of its stability, and its success in securing the happiness and contentment of the nation. It is, indeed, inconceivable that the Carthaginians should have attained such wealth and prosperity except under a good government; and the picture of faction, dissension, and disturbance, which we are accustomed to associate with it, belongs rather to the decline of the Punic empire, and is known to us only through the representation of its enemies.

The general outline of the topography of Carthage is tolerably certain, but the details are involved in almost unavoidable obscurity. Two schools of topographers place the site of the city respectively on the north and south of the peninsula, which the territory of Carthage undoubtedly occupied. It seems now certain that the latter are in the right. The most important feature of the ancient city was the citadel Byrsa (Bozra), the hill now occupied by a church dedicated to St Louis, who died at Tunis. It was surrounded by walls, and its summit was formerly crowned

by a temple of Æsculapins, standing at the head of sixty steps. The name Byrsa was probably also given to the whole quarter of the city as well as to the citadel itself. The city was enclosed on the land side by a triple wall, with towers at short intervals and casemates, which afforded stabling for 300 elephants and 4000 horses. The harbours of Carthage were artificial, and consisted of two basins,—one rectangular, for the merchant ships, opening into the lagoon of Tunis, and ending in a narrow passage, capable of being closed by a chain; the other circular, for ships of war, containing an island in the centre on which the admiral lived. Their site can be easily identified, although their size is now considerably reduced. Between the lagoon of Tunis and the sea ran out a tongue of land, the Tænia of Appian, still recognizable although altered in size and shape; on it stands the fort of the Goletta. Outside the walls lay the suburb of Megara or Magalia, now the districts of Mara, covered then as now with villas and gardens; and still beyond this, towards the north of the peninsula, lay the vast necropolis marked by the modern village of Camart. The Carthaginians, like the Jews and other Semitic nations, combined a feeling of reverence for ancestors with a fear of contamination from the dead; therefore, while their sepulchres were carefully and strongly built, they were situated far away from the habitations of the living, and in this case were not even visible either from Byrsa or Megara. We shall not be surprised that so little remains of this mighty city if we remember that for centuries it has been used as a quarry not only by its African neighbours but by the rapacious merchants of the West. The Cathedral of Pisa is said to have been built out of the ruins of Carthage; and Genoese vessels, trading with Tunis in the Middle Ages, seldom returned without a ballast of Tunis marble. The most impressive remains which strike the modern traveller are the arches of the aqueduct, once fifty miles long, which cannot be referred with certainty to Carthaginian or Roman origin. Much more lies hidden under drifted sand and the silt of the Bagradas. Even lately the marble blocks of the ancient walls have been in part destroyed by the works of the Tunis railway.

The antiquarian may regret the want of evidence to assist him in reconstructing the ancient city. The historian and philosopher will feel still more deeply that the hostility of the Romans has left him so few traces of this vigorous seion of the Semitic stock. Phœnician culture still remains a tantalizing riddle to those who would unravel the course of human progress. The world has lost as well as gained by the cruel and arrogant self-assertion which culminated in the supremacy of Rome. In the history of civilization the survival of the fittest has frequently been nothing else but the survival of those who by force, obstinacy, and cunning were fittest to survive. In modern days we can give their full value to enterprise in commerce, activity in geographical discovery, and the taste which decorated the metropolis with noble buildings and works of art, and collected a library which the ignorance of the conquerors dispersed amongst the barbaric princes of the desert. Virgil, standing in the light of a wiser and more tolerant age, did his best to soften the hatred of his countrymen against their hereditary foe, and to show that generous hospitality and refinement were not foreign to the court of Dido, and that the perfidy of Hannibal was a fitting retribution for the heartless treachery of Æneas.

Notices of Carthage in the classical writers are frequent, especially in Polybius, Diodorus, Livy, Appian, and Justin. The two works which have been the foundation of most that has been written on the subject in modern times are Büttger, *Geschichte der Carthagen*, Berlin, 1827, and Heeren, *Ideen*, vol. ii. pt. 1. There is a brilliant sketch of Carthage in Mommsen's *History of Rome*, vol. ii., and some sensible remarks in Grote's *History of Greece*, vol. x. The

articles on Carthage in Ersch and Gruber's *Encyclopædie*, in Smith's *Dictionary of Geography* (by Philip Smith), and in Pauli's *Real Lexicon*, are admirable. Indispensable for the study of the constitution is Kluge, *Aristoteles de Politia Carthaginiensium*. Illustrative of the topography may be mentioned Beulé, *Fouilles à Carthage*, and Davis, *Carthage and her Remains*. The standard work on the Phœnicians is still Movers, *Die Phönizien*, but it is probable that our knowledge of the subject may be much increased when the researches now in progress have been completed and co-ordinated. E. de Sainte Marie published in 1875 a *Bibliographie Carthaginoise* (Jourdan, Paris), of which there is a severe but instructive review in the *Literarisches Centralblatt* for May 20, 1876. (O. B.)

CARTHUSIANS, a religious order founded by St Bruno in the year 1084. (See BRUNO.) This saint, disgusted with the world, and especially with the conduct of Manasses, archbishop of Rheims, determined to live, in some remote and retired spot, a life dedicated to contemplation and religion. With six companions he went to consult Hugh, bishop of Grenoble, who led them to a spot among the mountains, about ten or twelve miles from the town, called Chartreuse; and Bruno at once fixed upon this as the site of the establishment which he was minded to found. Very many mediæval writers have exhausted the resources of language in describing the awful and terrible nature and aspect of this spot, shut in among naked and precipitous rocks, surrounded by sterile mountains, and for a large portion of the year buried in the snow; and many modern writers have celebrated the romantic and picturesque features of the place. The obscure name was destined to become familiar in every country and language of Europe, and the monastery which Bruno founded there, soon after mankind had begun to recover from the alarm caused by the belief that the world would come to an end in the 1000th year after Christ, has been the parent of all the numerous "Chartreux," "Certose," and "Charterhouses," and "Carthusian" establishments throughout Europe.

Peter the Venerable, abbot of Cluny, writing about fifty years later, speaks thus of the mode of life of the earliest Carthusians:—

"Warned by the negligence and lukewarmness of many of the older monks, they adopted for themselves and for their followers greater precaution against the artifices of the Evil One. As a remedy against pride and vain-glory they chose a dress more poor and contemptible than that of any other religious body; so that it is horrible to look on these garments, so short, scanty, coarse, and dirty are they. In order to cut up avarice by the roots, they enclosed around their cells a certain quantity of land, more or less, according to the fertility of the district: and they would not accept a foot of land beyond that limit if you were to offer them the whole world. For the same motive they limit the quantity of their cattle, oxen, asses, sheep, and goats. And in order that they might have no motive for augmenting their possessions, either of land or animals, they ordained that in every one of their monasteries there should be no more than twelve monks, with their prior the thirteenth, eighteen lay brothers, and a few paid servants. To mortify the flesh they always wear hair shirts of the severest kind, and their fasting is well-nigh continuous. They always eat bread of unbolted meal, and take so much water with their wine that it has hardly any flavour of wine left. They never eat meat, whether in health or ill. They never buy fish, but they accept it if it is given to them for charity. They may eat cheese and eggs only on Sundays and Thursdays. On Tuesdays and Saturdays they eat cooked vegetables. On Mondays, Wednesdays, and Fridays, they take only bread and water. They eat once a day only, save on the days of the octaves of Christmas, Easter, Pentecost, Epiphany, and one or two other solemnities. They live in separate little houses like the ancient monks of Egypt, and they occupy themselves continually with reading, prayer, and the labour of their hands, especially the writing of books. They recite the prayers for minor canonical hours in their own dwellings, when warned by the bell of the church; but they all assemble in church for matins and vespers. On feast days they eat twice, and sing all the offices in the church, and eat in the refectory. They do not say mass save on festivals and Sundays. They boil the vegetables served out to them in their own dwellings, and never drink wine save with their food."

As might be supposed, the rigour of this rule has been much modified. The Carthusian dress of very thick white cloth is no longer by any means the poorest or dirtiest of

monastic costumes. It consists of a cassock or froek and cloak of ample and comfortable length. But the practice of each monk living in his own separate dwelling has always characterized the Carthusians. They have never been Cœnobites.

The Carthusians had no written rule till one was composed for them, about forty-five years after the foundation of the first house of the order at Chartreuse, by Guigo, their fifth prior. Some of the most special and characteristic points of it are as follows :—

It was not permitted to the members of the order to practise any greater or additional austerities than those prescribed, without special licence from the prior. They were rarely to use medicine, but to be bled five times a year, and shaved six times. They were forbidden to receive any charity from usurers or excommunicated persons. They declined to bury any stranger (save a monastic person who might have happened to die within their walls) within their precincts, and refused to charge themselves with the saying of any anniversary or other masses for the dead,—the reason assigned for the refusal being, that “we have heard that the majority of priests are very ready to say masses, and to make splendid banquets whenever any one goes to pay them for praying for the dead—all which destroys abstinence, and renders prayer venal, making it depend on the will of whoso gives dinners.” If, says Guigo’s rule, our successors should find it impossible to maintain even this small number (thirteen) without being reduced to the odious necessity of begging, and wandering to beg, we advise them rather to reduce their number to as many as can be supported, than to expose themselves to such dangers. Under the seventh general of the order, St Anthelm, the practice of holding general chapters was first introduced among the Carthusians; these have always been held at the “Grande Chartreuse” near Grenoble, the parent establishment.

The earliest formal approbation of the Carthusian Order is attributed to Urban II. (ob. 1099). That pontiff, who had been a disciple of Bruno, when the latter was lecturing on theology at Rheims, had sent for Bruno to Rome a few years after his retirement to Chartreuse. The saint obeyed, taking all his monks with him. The latter shortly returned to Chartreuse, under Landuino, appointed by Bruno to be their second prior; but Bruno himself refused to be made archbishop of Reggio, and finding the life of Rome insupportable to him, soon obtained the Pope’s permission to accept a district of forest, in the diocese of Squillace in Calabria, given to him by Count Roger, where he founded the second house of his order. The rule and constitution of the order were frequently modified on subsequent occasions. The present rule is that which was fixed in 1578 and was corrected by a congregation of cardinals, published in 1581, and reconfirmed by Innocent XI. in 1682. According to those new statutes, observes Moroni (or rather the learned writer of the article in his *Dictionary*), some of the practices as at present enjoined are more austere than in the ancient rule, since the choral service and the office used by Carthusians are peculiar to them, and are of excessive length, following in many respects the ceremonies and rites of the ancient church. By these statutes the use of linen is wholly prohibited to them. They wear next the skin a shirt of horse-hair, bound by a cord girdle, and outside this a cassock and mantle of sergo; and they sleep on a paillasse, with woollen sheets. The portrait of a Carthusian monk may be seen in Bouanni’s *Catalogo*, at chapter 108, and a similar figure forms the 10th plate of Capparoni’s *Raccolta degli Ordini religiosi*, published at Rome in 1826.

It is a very common error to suppose that the Carthusians are a branch or off-shoot from the great Benedictine order. It is true that the formula of their “office” or choral service is nearly the same as that used by the different orders which belong to the great Benedictine family; but there is no relationship, of parentage or other, between the Carthusians and Benedictines. The superiors of Carthusian convents are called priors, and not abbots as is the case with the Benedictine orders. Their general is the prior of the “Grande Chartreuse” near Grenoble, and

resides always there, and not, as in the case of most other orders, at Rome. The order has a proctor-general (*Procuratore Generale*) who resides at Rome. Above all there is the radical difference in their mode of life,—the Benedictines being Cœnobites, the Carthusians eremitical, living each in his own separate dwelling, erected within the wall, which forms the cloister (*clausura*), but not even contiguous the one to the other.

St Bruno and his early successors made no pretension to any exemption from the jurisdiction of the ordinary, nor sought for any privilege of the kind. On the contrary they in a special manner recognized the bishop of Grenoble, in whose diocese their first and parent establishment was situated, as the chief and abbot of their order. But the constant and unfailing tendency, which led all the regular bodies to aim at such exemptions, and to encroach in every manner ever more and more on the authority and proper domain of the bishops and secular clergy, induced the Carthusians within little more than an hundred years after their foundation to beg and to obtain from Pope Boniface IX. a bull, dated 6th of March 1391, granting them the exemption in question. It is remarkable, as indicating the strength of this tendency, that although the bull of Boniface is the first recognition whatever of any such exemption, the Pope says in the document in question, “A supplication has been presented in your name, setting forth, that although your order *has been for a long time reputed exempt* from the jurisdiction of the ordinary, and dependent immediately on the Holy See,” &c. It had evidently come to be considered as a matter of course that monks, merely as such, were not subject to the authority of the bishop. The motive assigned for granting the exemption is that “certain persons seek by citing you to their tribunals to disturb you in the quietude and contemplation which are the object of your institute.”

The order of the Carthusians has always been one of the most respectable of the monastic bodies. It has maintained to a greater degree than most of them the spirit and qualities which presided at its foundation. Nor has it ever needed, as so many of its fellow communities, to be reformed. And although the services which it has rendered to literature cannot vie with those of the Benedictines, it has by no means been valueless to the world in this respect.

The order at one time possessed 172 monasteries, of which 75 were in France. It had also numerous establishments in England (where, as is well known, the “Charter House” near Smithfield, in London, was its principal house), Italy, Germany, and Spain. Hugh, bishop of Lincoln, canonized in 1220, was a Carthusian. The order, however, has had fewer saints than almost any of the others; so much so that the Carthusian Ferrari wrote a treatise of inquiry into the causes of this fact. To which query an answer may be found in the 97th of the *Ecclesiastical Letters* of Father Sarnelli, who was vicar-general under Benedict XIII. (published in ten volumes at Venice in 1716), to the following effect :—

“For canonization not only exalted virtues but the working of miracles is required. Now miracles are rarely performed by these solitary recluses, because the result of their doing so would be to call numbers of persons together, who would necessarily destroy or greatly impede the quietude of the contemplative life which it is the object of their rule to ensure. So true is this, continues the vicar-general, that Saint Antonine has recorded in his ecclesiastical history (bk. xv. ch. 22, sec. 2), that a certain Carthusian having performed a quantity of miracles at his tomb, became thereby, in consequence of the crowds who were attracted thither, so great a nuisance that the prior was obliged to go to the grave of the sainted deceased, and there command him on his obedience to do no more miracles,—an order which the dead saint thenceforward scrupulously obeyed.”

Father Petrejo published, in 1609, a *Biblioteca degli Scrittori dell’Ordine*, which has been subsequently con-

tinued by other hands. A copious account of the order may be found in Dugdale's *Monasticon*, and one yet more extended in the *Chronicle of the Chartreuse* by Dorlan; see also the *Origines Carthusianorum*, Cologne, 1609. A chronology of all the priors of the order was published at Rome in 1622. The device of the order consists of a globe surmounted by a cross, with the legend "*Stat crux dum volvitur orbis.*" (T. A. T.)

CARTIER, JACQUES, a French navigator, was born at St Malo, in Brittany, in 1494. According to the custom of the place, even his early youth was passed upon the sea; and he was probably already acquainted with the coast of Newfoundland when he was appointed by Francis I. to the command of the two ships, which, on the 20th of April 1534, set sail from St Malo, for the purpose of exploring the district beyond the fishing grounds. Cartier first touched at Cape Buonavista, on the east coast of Newfoundland, then passed northward along the coast, and, sailing south-west through the Straits of Belle Isle, discovered the mainland of Canada, which he claimed for France, by erecting a wooden cross with the inscription "*Vive le Roy de France.*" Next year a second expedition was placed under his control to explore the estuary of the St Lawrence. He penetrated as far as Hochelaga, a large fortified village at the foot of a hill, to which he gave the name of Mont Royal, and which is the site of the modern Montreal. But he did nothing more, and returned on the 16th May 1536, disgusted with the climate and with his crew weakened by scurvy, a disease then unknown in Europe. The idea of colonizing Canada was abandoned after this, till in 1540 Jean Francis de la Roche, Seigneur de Roberval, obtained permission to form a settlement. The project was carried out partly at Roberval's and partly at the king's expense; Cartier was sent out in command of five ships, in the spring of 1541; and in the autumn he arrived at the mouth of the St Lawrence. Near the present situation of Quebec he built a fort named Charlesbourg. But the Indians, whose king he had carried off with him on his last voyage, annoyed him so much with their attacks that he determined to return to France; and though Roberval arrived at Newfoundland in June 1542, with three ships and a colony of 200 men and women, and commanded him to turn back, he continued his homeward voyage. Whether this was his last expedition is disputed. Some say that he returned to the assistance of Roberval, in the autumn of 1543; but if this be so, we know nothing more. The rest of his life was spent in his native town or at the village of Limoilon, of which he was created seigneur by his patron Francis I. He was alive in 1552; but the date of his death is not known.

The interesting story of his discoveries and adventures is told in the *Brief récit de la navigation faite es îles de Canada, &c.*, Paris, 1545. This work is extremely rare; but the information it contained is to be found in the *Voyage de Jacques Cartier . . . en 1534*, a translation from the third volume of Ramusio's *Collection* (Venice, 1563), which was published at Rouen in 1598, and was reprinted in 1665; in Lescaurbot's *Histoire de la nouvelle France*; in Hakluyt's *Voyages* (1600, republished by the Hakluyt Society in 1850); and in the *Voyages de découvertes au Canada, entre les années 1534 et 1542*, a collection of reprints published in 1813 by the Historical and Literary Society of Quebec.

CARTOON (Italian, *cartone*, pasteboard), in painting, is a design drawn on thick paper or other material, which is used as a model for a large picture in fresco, oil, or tapestry. It was also formerly employed in glass and mosaic work. When cartoons are used in fresco-painting, the back of the design is covered with black-lead or other colouring matter; and, this side of the picture being applied to the wall, the artist passes over the lines of the design with a point, and thus obtains an impression. According to another method the outlines of the figures are pricked with a needle, and the cartoon, being placed

against the wall, is "pounced," i.e., a bag of black colouring-matter is drawn over the perforations, and the outlines are thus transferred to the wall. In fresco-painting, the portions of the cartoon containing figures were formerly cut out and fixed (generally in successive sections) upon the moist plaster. Their contour was then traced with a pointed instrument, and the outlines appeared lightly incised upon the plaster after the cartoon was withdrawn. In the manufacture of tapestries upon which it is wished to give a representation of the figures of cartoons, these figures are sometimes cut out, and laid behind or under the woof, to guide the operations of the artist. In this case the cartoons are coloured.

Cartoons have been executed by some of the most distinguished masters; the greatest extant performances in this line of art are those of Raphael. They are seven in number, coloured in distemper; and at present they adorn the South Kensington Museum in London, having been removed thereto from their proper home, the palace of Hampton Court. With respect to their merits, they count among the best of Raphael's productions, Lanzi even pronounces them to be in beauty superior to anything else the world has ever seen. Not that they all present features of perfect loveliness, and hubs of faultless symmetry,—this is far from being the case; but in harmony of design, in the universal adaptation of means to one great end, and in the grasp of soul which they display, they stand among the foremost works of the designing art. The history of these cartoons is curious. Leo X. employed Raphael in designing (in 1515–16) a series of Scriptural subjects, which were first to be finished in cartoons, and then to be imitated in tapestry by Flemish artists, and used for the decoration of the Sixtine Chapel. Two principal sets of tapestries were accordingly executed at Arras in Flanders; but it is supposed that neither Leo nor Raphael lived to see them. The set which went to Rome was twice carried away by invaders, first in 1527, and afterwards in 1798. In the first instance they were restored in a perfect state; but after their return in 1814 one was wanting—the cupid of a Genoese Jew having induced him to destroy it for the sake of the precious metal which it contained. Authorities differ as to the original number of cartoons, but there appear to have been twenty-five,—some by Raphael himself, assisted by Francesco Penni, others by the surviving pupils of Raphael. The cartoons after which the tapestries were woven were not, it would seem, restored to Rome, but remained as lumber about the manufactory in Arras till after the revolution of the Low Countries, when seven of them which had escaped destruction were purchased by Charles I., on the recommendation of Rubens. They were found much injured, "holes being pricked in them for the weavers to pounce the outlines, and in other parts they were almost cut through by tracing." It has never been ascertained what became of the other cartoons. Three tapestries, the cartoons of which by Raphael no longer exist, are in the Vatican,—representing the Stoning of St Stephen, the Conversion of St Paul, and St Paul in prison at Philippi.

Besides the cartoons of Raphael, two, to which an extraordinary celebrity in art-history attaches, were those executed in competition by Leonardo da Vinci and by Michelangelo,—the former named the Battle of the Standard, and the latter the Cartoon of Pisa—Soldiers bathing, surprised by the approach of the enemy. Both these great works have perished, but the general design of them has been preserved. In recent times some of the most eminent designers of cartoons have been masters of the German School,—Cornelius, Kaubach, Steinhilber, Fuhrieh, &c.; indeed, as a general rule, these artists appear to greater advantage in their cartoons than in the completed paintings of the same compositions. In England cartoon-work took

religious reformers in attacking the Brahmanic superstitions, and of the Protestant missionaries, who are unable to offer in the British society of India a sympathizing and protecting caste in place of that which it costs the convert so much to leave. Probably owing to the extent of our Indian Empire, and the great varieties of caste custom which prevail, one hears very conflicting accounts and opinions of the institution. Writers such as Robertson and Dubois have regarded it as the great safeguard of social tranquillity, and therefore as the indispensable condition of the progress in certain arts and industries which the Hindus have undoubtedly made. Others, such as James Mill, denounce it as now at least a great political blunder, fatal to free competition, and opposed to individual happiness. The latter view assumes a state of facts which is denied by Mr Colebrooke, one of the highest authorities on Indian matters. Writing in 1798 he says,¹ after pointing out that any person unable to earn a subsistence by the exercise of his profession may follow the trade of a lower caste or even of a higher; "Daily observation shows even Brahmins exercising the menial profession of a Sudra. We are aware that every caste forms itself into clubs or lodges, consisting of the several individuals of that caste residing within a small distance, and that these clubs or lodges govern themselves by particular rules or customs or by-laws. But though some restrictions and limitations, not founded on religious prejudices, are found among their by-laws, it may be received as a general maxim that the occupation appointed for each tribe is entitled merely to a preference. Every profession, with few exceptions, is open to every description of persons; and the discouragement arising from religious prejudices is not greater than what exists in Great Britain from the effects of municipal and corporation laws. In Bengal the numbers of people actually willing to apply to any particular occupation are sufficient for the unlimited extension of any manufacture." This is corroborated by Elphinstone,² who states that, during a long experience of India, he never heard of a single case of degradation from caste; and it is illustrated by the experience of the British army, in which men of all castes unite.

The popular notion of modern caste is that it involves certain restrictions on marriage, on profession, and on social intercourse, especially that implied in eating and drinking together. But how far intermarriage is permitted, what are the effects of a marriage permitted but looked on as irregular, what are the penalties of a marriage forbidden, whether the rules protecting trades and occupations are in effect more than a kind of unionism grown inveterate through custom, by what means caste is lost, and in what circumstances it may be regained,—these are questions on which very little real or definite knowledge exists. It is very remarkable that the Vedas, on which the whole structure of Brahmanic faith and morals professes to rest, give no countenance to the later regulations of caste. The only passage bearing on the subject is in the Purusha Sukta, the 90th Hymn of the 10th Book of the Rigveda Samhita. "When they divided man, how many did they make him? What was his mouth? what his arms? what are called his thighs and feet? The Brahmana was his mouth, the Raganya was made his arms, the Vaisya became his thighs, the Sudra was born from his feet." Haug finds in this a subtle allegory that the Brahmins were teachers, the Kshatriyas the warriors of mankind. But this is opposed to the simple and direct language of the Vedic hymns, and to the fact that in the accounts of creation there the origin of many things besides classes of men is attributed in the

same fanciful manner to parts of the divine person. It is in the Puranas and the Laws of Manu, neither of which claims direct inspiration, where they differ from the letter of the Veda, that the texts are to be found on which all that is objectionable in caste has been based. Even in the Vishnu Purana, however, the legend of caste speaks of the four classes as being at first "perfectly inclined to conduct springing from religious faith." It is not till after the whole human race has fallen into sin that separate social duties are assigned to the classes. The same hymn speaks of the evolution of qualities of Brahma. Sattva, or goodness, sprang from the mouth of Brahma; Rajas, or passion, came from his breast; Tamas, or darkness, from his thighs; others he created from his feet. For each one of these gunas, or primitive differences of quality, a thousand couples, male and female, have been created, to which the distinct heavens, or places of perfection of Prajapati, Indra, Maruts, and Gandharvas are assigned. To the gunas are related the yugas, or ages: 1st, the Krita, or glorious age of truth and piety, in which apparently no distinctions, at least no grades of excellence were known; 2d, the Treta, or period of knowledge; 3d, the Dvapara, or period of sacrifice; 4th, the Kali, or period of darkness. Bunsen supposes there may be an historical element in the legend that Pururava, a great conqueror of the Treta age founded caste. The yugas are hardly periods of historical chronology, but there is no doubt that the Vayu Purana assigns the definite origin of caste to the Treta period. "The perfect beings of the first age, some tranquil, some fiery, some active, and some distressed, were again born in the Treta, as Brahmins, &c., governed by the good and bad actions performed in former births." The same hymn proceeds to explain that the first arrangement did not work well, and that a second was made, by which force, criminal justice, and war were declared to be the business of the Kshatriyas; officiating at sacrifices, sacred study, and the receipt of presents to belong to the Brahmins; traffic, cattle, and agriculture to the Vaisyas; the mechanical arts and service to the Sudras. The Ramayana hymn suggests that in the four great periods the castes successively arrive at the state of *dharma* or righteousness. Thus, a Sudra cannot, even by the most rigorous self-mortification, become righteous in the period proper to the salvation of the Vaisyas. As the hymn speaks in the Dvapara age, it speaks of the salvation of Sudras as future, and not yet possible. Wholly in opposition to the story of a fourfold birth from Brahma is the legend that the castes sprang from Manu himself, who is removed by several generations of gods and demi-gods from Brahma. Then, again, the Santiparvan alleges that the world, at first entirely Brahmanic, was separated into castes merely by the evil works of man. Castehood consists in the exercise of certain virtues or vices. *Munis*, or persons born indiscriminately, frequently rise to the caste of Brahmins, and the offspring of Brahmins sinks to a lower level. The serpent observes: "If a man is regarded by you as being a Brahman only in consequence of his conduct, then birth is vain, until action is shown." But this change of caste takes place only through a second birth, and not during the life which is spent in virtue. Another poetical conception of caste birth is expressed in the Harivansa. The Brahmins were formed from an imperishable element (*Akshara*), the Kshatriyas from a perishable element (*Kshara*), the Vaisyas from alteration, and the Sudras from a modification of smoke. The general result of the foregoing texts is that there are several contradictory accounts of the origin of caste, and that these are for the most part unintelligible. Caste is described as a late episode in creation, and as born from different parts of different gods, from the mortal Manu, from abstract

¹ *Life and Essays of H. T. Colebrooke*, i. p. 104.

² *History of India*.

principles, and from non-entirety. It is also described as coeval with creation, as existing in perfection during the Krita period, and subsequently falling into sin. It is also said that only Brahmins existed at first, the others only at later periods. Then the rationalistic theories of the Santiparvan upset the very foundation of caste; viz., hereditary transmission of the caste character.¹ It seems clear that when the Vedas were composed, many persons who were not Brahmins acted as priests, and saints, the "preceptors of gods," by their "unstere fervour," rose from a lower rank to the dignity of Brahminhood. Originally, indeed, access to the gods by prayer and sacrifice was open to all classes of the community. As the Brahmins grew in political importance, they make religion an exclusive and sacred business. We find them deciding questions of succession to the throne, and enforcing their decisions. While in the earlier literature there are several instances of Brahmins receiving instruction from the hands of Kshatriyas, in the Puranas and Manu death is made to overtake Kshatriyas who are not submissive to the Brahmins; and in one case Visvamitra, the son of Gadhi, actually obtains Brahminhood as a reward for his submission. It seems certain that many of the ancient myths were expressly manufactured by the Brahmins to show their superiority in birth and in the favour of Heaven to the Kshatriyas,—a poetical effect which is sometimes spoiled by their claiming descent from their rivals. This brings us to a consideration of the theories which have been started to account for the appearance of Brahminic caste, as it is stereotyped in the Laws of Manu. James Mill, who invariably underestimated the influence on history of "previous states of society," has suggested that the original division must have been the work of some inspired individual, a legislator or a social reformer, who perceived the advantages which would result from a systematic division of labour. The subordination of castes he accounts for by the superstitious terror and the designing lust of power which have so frequently been invoked to explain the natural supremacy of the religious class. Because the ravages of war were dreaded most after the calamities sent by heaven, he finds that the military class properly occupy the second place. This arrangement he apparently contemplates as at no time either necessary or wholesome, and as finally destroyed by the selfish jealousies of caste, and by the degradations which the multiplication of trades made inevitable. Heeren² and Khayroth have contended that the division into castes is founded on an original diversity of race, and that the higher castes are possessed of superior beauty. The clear complexion and regular features of the Brahmins are said to distinguish them as completely from the Sudras as the Spanish Creoles were distinguished from the Peruvians. "The high forehead, the stout build, and the light copper colour of the Brahmins and other castes allied to them, appear in strong contrast with the somewhat low and wide heads, slight make, and dark bronze of the low castes" (Stevenson, quoted by Müller, *Chips*, ii. p. 327).³ This explanation is, however, generally conjoined with that founded on the tradition of conquest by the higher castes. There is no doubt that the three castes of lighter colour (traivarnika), the white

Brahmins, the red Kshatriyas, the yellow Vaisyas, are, at least in the early hymns and Brahmanas, spoken of as the Aryas, the Sanskrit-speaking conquerors, in contradistinction to the dark cloud of the Turanian aborigines Dasys. In fact *arya*, which means noble, is derived from *arya*, which means householder, and was the original name of the largest caste, now called Vaisyas. Roth, in his "Brahma and the Brahmins,"⁴ holds that the Vedic people advanced from their home in the Punjab, drove the aborigines into the hills, and took possession of the country lying between the Ganges, the Jumna, and the Vindhya range. "In this stage of complication and disturbance," he says, "power naturally fell into the hands of those who did not possess any direct authority," i.e., the domestic priests of the numerous tribal kings. The Sudras he regards as a conquered race, perhaps a branch of the Aryan stock, which immigrated at an earlier period into India, perhaps an autochthonous Indian tribe. The latter hypothesis is opposed to the fact that, while the Sudra is debarred from sharing three important Vedic sacrifices, the Bhagavata Purana expressly permits him to sacrifice "without mantras," and imposes on him duties with reference to Brahmins and cows which one would not expect in the case of a nation strange in blood. But unless a previous subordination of castes among the conquering race be supposed, it seems difficult to see why the warrior-class, who having contributed most to the conquest must have been masters of the situation, should have consented to degradation below the class of Brahmins. The position of the Sudra certainly suggests conquest. But are there sound historical reasons for supposing that Brahmins and Sudras belonged to different nations, or that either class was confined to one nation? The hypothesis is slightly modified by Meiners,⁵ who supposes that instead of one conquest there may have been two successive immigrations,—the first immigrants being subdued by the second, and then forming an intermediate class between their conquerors and the aborigines; or, if there were no aborigines, the mixture of the two immigrant races would form an intermediate class. In the same way Mr Talboys Wheeler⁶ suggests that the Sudra may be the original conquerors of the race now represented by the Pariahs. Most of these explanations seem rather to describe the mode in which the existing institutions of caste might be transplanted from one land to another, from a motherland to its colonies, and altered by its new conditions. Military conquest, though it often introduces servitude, does not naturally lead to the elevation of the priesthood. It is unscientific to assume large historical events, or large ethnological facts, or the existence of some creator of social order.⁷

As Benjamin Constant⁸ points out, caste rests on the religious idea of an indelible stain resting on certain men, and the social idea of certain functions being committed to certain classes. The idea of physical purity was largely developed under the Mosaic legislation; in fact the internal regulations of the Essenes (who were divided into four classes) resemble the frivolous prohibitions of Brahmanism. As the daily intercourse of men in trade and industry

³ The idea of a conquering white race is strangely repeated in the later history of India. The Rajputs and Brahmins are succeeded by the Mussulmans, the Turks, the Afghans. There was an aristocracy of colour under the Moghul dynasty. But under an Indian climate it could not last many generations. The Brahmins of Southern India were as black as the lowest castes; the Chandalas are said to be descended from Brahmins. According to Manu the Chandala must not dwell within town; his sole wealth must be dogs and asses; his clothes must consist of the mantles of deceased persons; his dishes must be broken pots. Surely this vituperative description must apply to an aboriginal race.

⁷ For a characteristic appreciation of caste see Comte, *Cours de Philosophie Positive*, vi. c. 8. He regards the hereditary transmission of functions under the rule of a sacerdotal class as a necessary and universal stage of social progress, greatly modified by war and colonization. The morality of caste was, he contends, an improvement on what preceded; but its permanence was impossible, because "the political rule of intelligence is hostile to human progress." The seclusion of women and the preservation of industrial inventions were features of caste; and the higher priests were also magistrates, philosophers, artists, engineers, and physicians.

⁸ *De la Religion*, ii. 8.

presents numberless occasions on which the stain of real or fancied impurity might be caught, the power of the religious class who define the rules of purity and the penalties of their violation becomes very great. Macleod has also stated two important elements which enter into the conception of caste: "That our place in the world is assigned to us by divine sovereignty; and that the co-operation and sympathy of a brotherhood are essential to our usefulness and happiness in the world."¹ There is no doubt that the Hindu mind is deeply religious, and therefore naturally prepared for Purohiti, or priest-rule. They were also passionately attached to their national hymns, some of which had led them to victory, while others were associated with the benign influences of nature. Only the priest could chant or teach these hymns, and it was believed that the smallest mistake in pronunciation would draw down the anger of the gods. But however favourable the conditions of spiritual dominion might be, it seems to have been by no more natural process than hard fighting that the Brahmins finally asserted their supremacy. We are told that Parasurama, the great hero of the Brahmins, "cleared the earth thrice seven times of the Kshatriya caste, and filled with their blood the five large lakes of Samauti." Mr Wheeler thinks that the substitution of blood-sacrifices for offerings of parched grain, clarified butter, and soma wine marks an adaptation by the Brahmins of the great military banquets to the purposes of political supremacy. It is not therefore till the Brahmanic period of Indian history, which ends with the coming of Sakya Mouni, in 600 B.C., that we find the caste-definitions of Manu realized as facts. These are—"To Brahmins he (*i.e.*, Brahma) assigned the duties of reading the Vedas, of teaching, of sacrificing, of assisting others to sacrifice, of giving alms if they be rich, and if indigent of receiving gifts."² The duties of the Kshatriya are "to defend the people, to give alms, to sacrifice, to read the Veda, to shun the allurements of sensual gratification." The duties of a Vaisya are "to keep herds of cattle, to bestow largesses, to sacrifice, to read the scripture, to carry on trade, to lend at interest, and to cultivate land." These three castes (the twice born) wear the sacred thread. The one duty of a Sudra is "to serve the before-mentioned classes without depreciating their worth."³ The Brahman is entitled by primogeniture to the whole universe; he may eat no flesh but that of victims; he has his peculiar clothes. He is bound to help military and commercial men in distress. He may seize the goods of a Sudra, and what-

ever the latter acquires by labour or succession beyond a certain amount. The Sudra is to serve the twice born; and even when emancipated cannot be anything but a Sudra. He may not learn the Vedas, and in sacrifice he must omit the sacred texts. A Sudra in distress may turn to a handicraft; and in the same circumstances a Vaisya may stoop to service. Whatever crime a Brahman might commit, his person and property were not to be injured; but whoever struck a Brahman with a blade of grass would become an inferior quadruped during twenty-one transmigrations. In the state the Brahman was above all the ministers; he was the rajah's priest, exempt from taxation, the performer of public sacrifices, the expounder of Manu, and at one time the physician of bodies as well as of souls. He is more liable than less holy persons to pollution, and his ablutions are therefore more frequent. A Kshatriya who slandered a Brahman was to be fined 100 panas (a copper weight of 200 grains); a Vaisya was fined 200 panas; a Sudra was to be whipped. A Brahman slandering any of the lower castes pays 50, 25, or 12 panas. In ordinary salutations a Brahman is asked whether his devotion has prospered; a Kshatriya, whether he has suffered from his wounds; a Vaisya whether his health is secure; a Sudra whether he is in good health.⁵ In administering oaths a Brahman is asked to swear by his veracity; a Kshatriya by his weapons, house, or elephant; a Vaisya by his kine, grain, or goods; a Sudra by all the most frightful penalties of perjury. The Hindu mind is fertile in oaths; before the caste assembly the Dhurm, or caste custom, is sometimes appealed to, or the feet of Brahma, or some cow or god or sacred river, or the bel (the sacred creeper), or the roots of the turmeric plant. The castes are also distinguished by their modes of marriage. Those peculiar to Brahmins seem to be,—1st, Brahma, when a daughter, clothed only with a single robe is given to a man learned in the Veda whom her father has voluntarily invited and respectfully receives; 2d, Deva or Daiva, when a daughter, in gay attire is given, when the sacrifice is already begun, to the officiating priest. The primitive marriage forms of Rashesas or Rashesa, when a maiden is seized by force from home, while she weeps and calls for help, is said to be appropriate to Kshatriyas. To the two lower castes the ceremony of Asura is open, in which the bridegroom, having given as much wealth as he can afford to the father and paternal kinsman and to the damsel herself, takes her voluntarily as his bride. A Kshatriya woman on her marriage with a Brahman must hold an arrow in her hand; a Vaisya woman marrying one of the sacerdotal or military classes must hold a whip; a Sudra woman marrying one of the upper castes must hold the skirt of a mantle.

How little the system described by Manu applies to the existing castes of India may be seen in these facts—(1) that there is no artisan caste mentioned by Manu; (2) that eating with another caste, or eating food prepared by another caste, is not said by him to involve loss of caste, though these are now among the most frequent sources of degradation. The system must have been profoundly modified by the teaching of Buddha: "As the four rivers which fall into the Ganges lose their names as soon as they mingle their waters with the holy river, so all who believe in Buddha cease to be Brahmins, Kshatriyas, Vaisyas, and Sudras." After Buddha, Sudra dynasties ruled in many parts of India and under the Moghul dynasty the Cayets, a race of Sudras, had almost a monopoly of public offices. But Buddha did not wish to abolish caste. Thus it is related that a Brahman Pundit who had embraced the doctrines of Buddha never-

¹ *Peeps at the Far East*, p. 186.

² The great mass of the Brahmins were in reality mendicants, who lived on the festivals of birth, marriage, and death, and on the fines exacted for infractions of caste rule. Others had establishments called Muths, endowed with Jager villages. There were two distinct orders of officiating priests,—the Purohita, or family priest, who performed all the domestic rites, and probably gave advice in secular matters, and the Guru, who is the head of a religious sect, making tours of superintendence and exaction, and having the power to degrade from caste and to restore. In some cases the Guru is recognized as the Mehitra or officer of the caste-assembly, from whom he receives Haks, or salary, and an exemption from house and stamp taxes, and service as begarree (Steele's *Law and Customs of Hindoo Castes within the Dekkan Provinces*, 1826; new edition, 1868). Expulsion from caste follows on a number of moral offences (*e.g.*, assault, murder, &c.), as well as ceremonial offences (*e.g.*, eating prohibited food, eating with persons of lower caste, abstaining from funeral rites, having connection with a low-caste woman). Exclusion means that it is not allowed to eat with or enter the houses of the members of the caste, the offender being in theory not degraded but dead. For some heinous offences, *i.e.*, against the express letter of the Shasters, no re-admission is possible. But generally this depends on the ability of the outcaste to pay a fine, and to supply the caste with an expiatory feast of sweetmeats. He has also to go through the Sashtanyam, or prostration of eight members, and to drink the Panehakaryam, *i.e.*, drink of the five products of the cow (*Description of People of India*, Abbé J. A. Dubois, Missionary in Mysore, Eng. Tr., London, 1817. There is a valuable new edition of this work by Mr Pope, Madras, 1862).

⁴ As to the rights of the castes to participate in domestic rites, see BRAHMANISM, vol. iv. p. 204.

⁵ Wheeler, ii. 533.

theless found it necessary, when his king touched him, to wash from head to foot.¹ Alexander the Great found no castes in the Punjab, but Megasthenes has left an account of the ryots and tradesmen, the military order and the gymnosophists (including the Buddhist Germanes) whom he found in the country of the Ganges.² From his use of the word *gymnosophist* it is probable that Megasthenes confounded the Brahmans with the hermits or fakeers; and this explains his statement that any Hindu might become a Brahman. Megasthenes spent some time at the court of Sandracottus, a contemporary of Seleucus Nicator. All the later Greeks³ follow his statement and concur in enumerating seven Indian castes,—sophists, agriculturists, herdsmen, artisans, warriors, inspectors, councillors. On the revival of Brahmanism it was found that the second and third castes had disappeared, and that the field was now occupied by the Brahmans, the Sudras, and a host of mixed castes, sprung from the original twelve, Unooloon and Pruteeloom, left-hand and right-hand, which were formed by the crossing of the four original castes. Manu himself gives a list of these impure castes, and the Ayeen Akberi (1556–1605) makes the positive statement that there were then 500 tribes bearing the name of Kshatriya, while the real caste no longer existed. Most of these subdivisions are really trade-organizations, many of them living in village-communities, which trace descent from a pure caste. Thus in Bengal there are the Vaidya or Baidya, the physicians, who, Manu says, originated in the marriage of a Brahman father and a Vaisya mother. In Mysore alone Major Puckle reports that there are 110 different castes; and the varieties of custom in the Deccan are well brought out in the book of Mr Steele, to which we have already referred. As Colebrooke said, Brahmans and Sudras enter into all trades, but Brahmans (who are profoundly ignorant even of their own scriptures) have succeeded in maintaining their monopoly of Vedic learning, which really means a superficial acquaintance with the Puranas and Manu. Though they have succeeded in excluding others from sacred employment, only a portion of the caste are actually engaged in religious ceremonies, in sacred study, or even in religious begging. Many are privates in the army, many water-carriers, many domestic servants. And they have like other castes many sub-divisions which prevent intimate association and intermarriage. The ideal Brahman is gone. Instead of a priest “with his hair and beard clipped, his passions subdued, his mantle white, his body pure, golden rings in his ear,” you have a mean, selfish, often extremely dirty, person, whose remaining power lies in extortion by dishonesty. But the hold which caste has on the Hindu minds may, perhaps, be most clearly seen in the history of the Christian missions and in comparatively recent times. The Jesuits Xavier and Fra dei Nobili did everything but become Brahmans in order to convert the South of India,—they put on a dress of cavy or yellow colour, they made frequent ablutions, they lived on vegetables and milk, they put on their foreheads the sandal-wood paste used by the Brahmans,—and Gregory XV. published a bull sanctioning caste regulations in the Christian churches of India. The Danish mission of Tranquebar, the German mission of the heroic Schwarz, whose headquarters were Tanjore, also permitted caste to be retained by their followers. Even the priests of Buddha, whose life was a protest against caste, re-erected the system in the island of Ceylon, where the *radis* or *radias* were reduced to much the same state as the Pariahs.⁴ At the present day the progress of Protestant missions amounts almost to nothing. In Dr

Mullen's report down to 1871 the whole force of 579 English missionaries, 323 native ordained ministers, and 1993 other native preachers had produced a native Christian community of only 280,600. There was probably a much larger Roman Catholic population in the south of India about the middle of the 18th century.

It is still the general law that to constitute a good marriage the parties must belong to the same caste, but to unconnected families.⁵ Undoubtedly, however, the three higher castes were always permitted to intermarry with the caste next below their own, the issue taking the lower caste or sometimes forming a new class. A Sudra need not marry a wife of the same caste or sect as himself. So recently as 1871 it was decided by the Judicial Committee of the Privy Council that a marriage between a Zemindar of the Malavar class, a sub-division of the Sudra caste, with a woman of the Vellala class of Sudras is lawful. Generally also a woman may not marry beneath her own caste. The feeling is not so strong against a man marrying even in the lowest caste, for Manu permits the son of a Brahman and a Sudra mother to raise his family to the highest caste in the seventh generation. The illegitimacy resulting from an invalid marriage does not render incapable of caste; at least it does not so disqualify the lawful children of the bastard. On a forfeiture of caste by either spouse intercourse ceases between the spouses: if the out-caste be a sonless woman, she is accounted dead, and funeral rites are performed for her; if she have a son, he is bound to maintain her. It is remarkable that the professional concubinage of the dancing-girl does not involve degradation, if it be with a person of the same caste. This suggests that whatever may be the function of caste, it is not a safe guardian of public morality. The rules as to prohibited degrees in marriage used to be very strict, but they are now relaxed. An act of 1856 legalized re-marriage by widows in all the castes, with a conditional forfeiture of the deceased husband's estate, unless the husband has expressly sanctioned the second marriage. The recent Marriage Act was directed against the iniquitous child marriages; it requires a *minimum* age. In many ways the theoretical inferiority of the Sudra absolves him from the restraints which the letter of the law lays on the higher castes. Thus, a Sudra may adopt a daughter's or sister's son, though this is contrary to the general rule that the adopter should be able to marry the mother of the adopted person. The rule requiring the person adopted to be of the same caste and *gotra* or family as the adopter is also dispensed with in the case of Sudras. In fact, it is only a married person whom a Sudra may not adopt. As regards inheritance the Sudra does not come off so well in competition with the other castes. “The sons of a Brahmana in the several tribes have four shares or three or two or one; the children of a Kshatriya have three portions or two or one; and those of a Vaisya take two parts or one.” This refers to the case permitted by law, and not unknown in practice, of a Brahman having four wives of different castes, a Kshatriya three, and so on. But all sons of inferior caste are excluded from property coming by gift to the father; and a Sudra son is also excluded from land acquired by purchase. It must be recollected, however, that under an Act of 1850, loss of caste no longer affects the capacity to inherit or to be adopted. In cases of succession *ab intestato* on failure of the preceptor, pupil, and fellow-student (heirs called by the Hindu law after relatives), a priest, or any Brahman, may succeed. Where a Sudra is the only son of a Brahman, the Sapinda, or next of kin, would take two-thirds of the inheritance; where he is the only son of any

other twice-born father, the Sapinda would take one-half. Possibly, the rule of equal division among sons of equal caste did not at first apply to Brahmans, who, as the eldest sons of God, would perhaps observe the custom of primogeniture among themselves. On the other hand it was laid down in the Judicial Committee in 1869, contrary to the collected opinions of the Pundits of the Sudder Court, that, in default of lawful children, the illegitimate children of the Sudra caste inherit their putative father's estate, and, even if there be lawful children, are entitled to maintenance out of the estate. It had previously been decided by Sir Edward Ryan in 1857 that the illegitimate children of a Rajput, or of any other member of a superior caste, have no right of inheritance even under will, but a mere right to maintenance, provided the children are docile. It seems then that the Kshatriya and Vaisya castes, though in one sense non-existent, still control Hindu succession.¹

With regard to Persia the *Zend Avesta* speaks of a fourfold division of the ancient inhabitants of Iran into priests, warriors, agriculturists and artificers; and also of a sevenfold division corresponding to the seven *amschespands*, or servants of Ormuzd. This was no invention of Zoroaster, but a tradition from the golden age of Jamshid or Diemschid. The priestly caste of Magi was divided into Herbeds or disciples, Mobeds or masters, and Destur Mobeds or complete masters. The last-named were alone entitled to read the liturgies of Ormuzd; they alone predicted the future and carried the sacred *costi*, or girdle, *havan*, or cup, and *barsom*, or bunch of twigs. The Zend word *baresma* is supposed to be connected with Brahma, or sacred element, of which the symbol was a bunch of kusa grass, generally called *veda*. The Persian and Hindu religions are further connected by the ceremony called Homa in the one and Soma in the other. Haug, in his *Tract on the Origin of Brahmanism* (quoted by Muir, *ubi supra*), maintains that the division in the *Zend Avesta* of the followers of Ahura Mazda into Atharvas, Rathaesvas, and Vastrya was precisely equivalent to the three superior Indian castes. He also asserts that only the sons of priests (Atharvas) could become priests, a rule still in force among the Parsis. The Book of Daniel rather suggests that the Magi were an elective body; and as regards the secular classes there does not seem to be a trace of hereditary employment or religious subordination. There is a legend in the Dabistan of a great conqueror, Mahabad, who divided the Abyssinians into the usual four castes; and Strabo mentions a similar classification of the Iberians into kings, priests, soldiers, husbandmen, and menials.

At one time it was the universal opinion that in Egypt there were at least two great castes, priests and warriors, the functions of which were transmitted from father to son, the minor professions grouped under the great castes being also subject to hereditary transmission. This opinion was held by Otfried Müller,² Meiners of Göttingen, and others. Doubts were first suggested by Rossellini, and after Champollion had deciphered the hieroglyphic inscriptions, J. J. Ampère³ boldly announced that there were in Egypt no castes strictly so called; that in particular the professions of priest, soldier, judge, &c., were not hereditary; and that the division of Egyptian society was merely that which is generally found in certain stages of social growth between the liberal professions and the mechanical arts and trades. No difference of colour, or indeed of any feature, has been

observed in the monumental pictures of the different Egyptian castes. From an inspection of numerous tombs, sarcophagi, and funeral stones, which frequently enumerate the names and professions of several kinsfolk of the deceased, Ampère has concluded that sacerdotal and military functions were sometimes united in the same person, and might even be combined with civil functions; that intermarriage might certainly take place between the sacred and military orders; and that the members of the same natural family did frequently adopt the different occupations which had been supposed to be the exclusive property of the castes. The tombs of Beni Hassan show in a striking manner the Egyptian tendency to accumulate, rather than to separate, employments. Occasionally families were set apart for the worship of a particular divinity. An interesting "section" of Egyptian society is afforded by a granite monument preserved in the Museum at Naples. Nine figures in bas-relief represent the deceased, his father, three brothers, a paternal uncle, and the father and two brothers of his wife. Another side contains the mother, wife, wife's mother, and maternal aunts. The deceased is described as a military officer and superintendent of buildings; his elder brother as a priest and architect; his third brother as a provincial governor, and his father as a priest of Ammon. The family of the wife is exclusively sacerdotal. Egyptian caste, therefore, permitted two brothers to be of different castes, and one person to be of more castes than one, and of different castes from those to which his father or wife belonged. The lower employments, commerce, agriculture, even medicine, are never mentioned on the tombs. The absolute statements about caste in Egypt, circulated by such writers as Reynier and De Goguet, have, no doubt, been founded on passages in Herodotus (ii. 143, 164.), who mentions seven classes, and makes war an hereditary profession; in Diodorus Siculus (i. 2-8), who mentions five classes and an hereditary priesthood; and in Plato, who, anxious to illustrate the principle of compulsory division of labour, on which his republic was based, speaks in the *Timæus* of a total separation of the six classes,—priests, soldiers, husbandmen, artisans, hunters, and shepherds. Heeren (ii. 594) does not hesitate to ascribe the formation of Egyptian caste to the meeting of different races. According to the chronology constructed by Bunsen the division into castes began in the period 10,000-9000, and was completed along with the introduction of animal worship and the improvement of writing under the third dynasty in the 6th or 7th century of the Old Empire. The Scholiast of Apollonius Rhodius, on the authority of Dicæarchus, in the Second Book of *Hellas*, mentions a king, Sesonchosis, who, about 3712 B.C., "enacted that no one should abandon his father's trade, for this he considered as leading to avarice." Bunsen conjectures that this may refer to Sesostoris, the lawgiver of Manetho's third or Memphite dynasty, the eighth from Menes, who introduced writing, building with hewn stone, and medicine; possibly, also, to Sesostris, who, Aristotle says (*Polit.*, vii. 1), introduced caste to Crete. He further observes that in Egypt there was never a conquered indigenous race. There was one nation with one language and one religion; the public panegyrics embraced the whole people; every Egyptian was the child and friend of the gods. The kings were generally warriors, and latterly adopted into the sacerdotal caste. Intermarriage was the rule, except between the swineherds and all other classes. "Every shepherd is an abomination unto the Egyptians" (Gen. xlv. 34). (w. c. s.)

CASTEL, LOUIS BERTRAND (1688-1757), a learned mathematician, was born at Montpellier in 1688, and entered the order of the Jesuits in 1703. At first he was a student of literature, but he afterwards devoted himself entirely to mathematics and natural philosophy. He

¹ For an account of the actual condition of castes see the magnificently illustrated Government publication *The People of India*, edited by Kaye and Watson, 6 vols. 4to, 1868-72; also Sherring's *Castes of Benares*.

² *Manual of Archaeology*.

³ *Revue des Deux Mondes*, 15th September 1848.

wrote several scientific works, that which attracted most attention at the time being his *Optique des Couleurs*, or treatise on the melody of colours. He endeavoured to illustrate the subject by a *clavecin oculaire*, or ocular harpsichord; but the treatise and the illustration were quickly forgotten. He also published a critical account of the system of Sir Isaac Newton in French.

CASTEL-A-MARE, or CASTELLAMARE, a city and seaport of Italy, on the Gulf of Naples, 15 miles by rail south-east of the city of that name. It is situated on the lower slopes of Monte Sant' Angelo (the ancient *Mons Gaurus*), and along a sheltered beach, commanding an extensive view of the Bay of Naples from Vesuvius to Misenum. It stands near the site of the ancient *Stabiae*, which was destroyed by Sulla in the social war, but continued to exist as a small place till 79 A.D., when it was overwhelmed along with Pompeii and Herculaneum by the great eruption of Vesuvius, and became for ever celebrated as the death-scene of the elder Pliny. The castle, from which the city takes its name, was erected by Frederick II., surrounded by walls and towers in the 13th century by Charles I. of Anjou, and strengthened by additional fortifications by Alphonso I. of Aragon. Castel-a-mare is the seat of a bishopric, and has a royal palace, a cathedral, several churches and convents, a military hospital, barracks, a handsome quay, a royal arsenal, and a dockyard, where the large ships of the Neapolitan navy were formerly built. In shipbuilding it still ranks second of the Italian towns; and there are manufactures of linen, silk and cotton goods, and leather. The port is small, and divided by two forts. The hill immediately above the town is covered with villas and casinos. The royal casino of Quisisana, originally built by Charles II. of Anjou, was restored by Ferdinand I. of Naples. It is more remarkable for its fine prospect than for its magnificence as a palace. Population about 26,000.

CASTEL-A-MARE, a seaport town of Sicily, on a bay to which it gives its name, in the province of Trapani, and about 30 miles west of Palermo. It occupies the site of the port of the ancient *Syracusa*, which lay about six miles distant, and it still carries on a considerable export trade in wine, fruit, grain, and timber. Population 11,280.

CASTEL SARRASIN, a town of France, capital of an arrondissement, in the department of Tarn et Garonne, situated on the Songne or Azine, near its influx into the Garonne, 12 miles west of Montauban. The walls which formerly surrounded the town have been converted into promenades. It has manufactures of serges and other woollen stuffs, hats, and leather, and some trade in corn grown in the vicinity. The town is said by some investigators to receive its name from the erection of its castle by the Saracens, but according to others the present form of the word is only a corruption of Castel sur Azine. The Parliament of Toulouse took refuge within the town in 1595. Population in 1872, 3064.

CASTEL VETRANO, a town of Sicily, near the south-east extremity of the island, 12 miles east of Mazzara, in the province of Trapani. It is well and regularly built, and has a population of about 20,000, many of whom are hereditary tenants of the dukes of Monteleone, who have a palace in the town. Near it are the ruins of the ancient city *Selinus*, which was destroyed by the Carthaginians 409 B.C.

CASTELL, EDMUND (c. 1606–1685), a learned English Orientalist, was born about 1606, at Hatley, in Cambridgeshire. At the age of fifteen he entered Emmanuel College, Cambridge, but he afterwards changed his residence to St John's, where he enjoyed the use of a valuable library. His great work was the compiling of his *Lexicon Heptaglotton Hebraicum, Chaldaicum, Syriacum, Samaritanum, Ethiopicum, Arabicum, et Persicum* (London, 1669).

Over this book he spent eighteen years, working (if we may accept his own statement) from sixteen to eighteen hours a day; he employed fourteen assistants, and by an expenditure of £12,000 brought himself to poverty, for his lexicon, though full of the most unusual learning, did not find purchasers. His loss was partly compensated by a number of preferments, including a prebend at Canterbury, and the professorship of Arabic at Cambridge. Castell also lent the aid of his erudition to the preparation of Dr Walton's well-known Polyglott Bible. His MSS. he bequeathed to the University of Cambridge.

CASTELLI, IGNAZ FRIEDRICH (1781–1862), an Austrian dramatist, was born on 6th March 1781, at Vienna. He completed his education at the university in his native town, and entered the profession of law. The leisure left him by his employment in a subordinate Government office he devoted to literary work, in particular to the composition and adaptation of dramatic pieces. Some of his war-songs became exceedingly popular, and so excited the ill-feeling of the French that Castelli had to flee from Vienna and take refuge in Hungary. In 1811 he was made director of the court theatre by Prince Lobkowitz, but he resigned this post in 1814 in order to accompany Count Cavriani to France as secretary. He returned to Vienna with Count Münch-Bellinghausen, and for many years occupied himself entirely with literary work. He died in 1862 at Lilienfeld. From 1840 he had enjoyed a pension from Government. His autobiography appeared in three volumes, 1861–2. His numerous dramas and minor pieces are distinguished only by their light gaiety and humour.

CASTELLO, BERNARDO (1557–1629), a Genoese portrait and historical painter, born at Albaro near Genoa, was the intimate friend of Tasso, and took upon himself the task of designing the figures of the *Gerusalemme Liberata*, published in 1590; some of these subjects were engraved by Agostino Caracci. Besides painting a number of works in Genoa, mostly in a rapid and superficial style, Castello was employed in Rome, and in the court of the duke of Savoy.

CASTELLO, GIOVANNI BATTISTA (1500–1569), an eminent Italian historical painter, was born in Bergamo, and is hence ordinarily termed Il Bergamasco. He belongs, however, to the school of Genoa, but does not appear to have had any family relationship with the other two painters named Castello, also noticed here. He was employed to decorate the Nunziata di Portoria in Genoa, the saloon of the Lanzi Palace at Gorlago, and the Pardo Palace in Spain. His best-known works are the Martyrdom of St Sebastian, and the picture of our Saviour as Judge of the World on one of the vaultings of the Nunziata. He was an architect and sculptor as well as painter. In 1567 he was invited to Madrid by Philip II., and there he died, holding the office of architect of the Royal Palaces.

CASTELLO, VALERIO (1625–1659), was the youngest son of Bernardo Castello, noticed above. He surpassed his father, and particularly excelled in painting battle-scenes. He painted the Rape of the Sabines, now in the Palazzo Brignole, Genoa, and decorated the cupola of the Church of the Annunciation in the same city. In these works he is regarded by his admirers as combining the fire of Tintoretto with the general style of Paolo Veronese; his premature death cut short a career of high hopes.

CASTELLON DE LA PLANA, a town of Valencia, in Spain, the capital of a modern province, is situated about 4 miles from the sea, and 40 miles N.N.E. of Valencia, in 39° 57' N. lat. and 0° 4' W. long. It derives its name from the extensive plain in which it is situated, and which is watered artificially by an aqueduct brought for the most part through solid rock from the Mijares, a stream about

five miles distant. It is walled, and contains two nunneries, three monasteries, and two hospitals, as well as several churches, in which there are paintings by Ribalta, a native artist. There is a brisk local trade maintained in the weaving of sail-cloth and linen. In the time of the Moors the city was situated on a height to the north of the present position, to which it was removed by Jayme I. in 1233. Population, 20,123.

CASTELNAU, MICHEL DE, SIEUR DE LA MAUVISSIÈRE (c.1520–1592), a French soldier and diplomatist, ambassador to Queen Elizabeth, was born in Touraine about 1520. He was one of a large family of children, and his grandfather, Pierre de Castelnau, was equerry to Louis XII. Endowed with a clear and penetrating intellect and remarkable strength of memory, he received a careful education, and made rapid progress in his studies. To complete his education he travelled in Italy and made a long stay at Rome. He then spent some time in the Island of Malta, afterwards entered the army, and made his first acquaintance with the art of war in the chequered campaigns of the French in Italy. His abilities and his courage won for him the friendship and protection of the cardinal of Lorraine, who took him into his service. In 1557 a command in the navy was given to him, and the cardinal proposed to get him knighted. This, however, he declined, and then rejoined the French army in Picardy. Various delicate missions requiring tact and discretion were entrusted to him by the constable de Montmorency, and these he discharged so satisfactorily that he was sent by the king, Henry II., to Scotland, with despatches for Mary Stuart, then betrothed to the Dauphin (afterwards Francis II). From Scotland he passed into England, and treated with Queen Elizabeth respecting her claims on Calais (1559), a settlement of which was effected at the congress of Cambray. Castelnau was next sent, with the title of ambassador, to the princes of Germany, for the purpose of prevailing upon them to withdraw their favour from the Protestants. This embassy was followed by missions to Margaret of Parma, governess of the Netherlands, to Savoy, and then to Rome, to ascertain the views of Pope Paul IV. with regard to France. Paul having died just before his arrival, Castelnau used his influence in favour of the election of Pius IV. Returning to France he once more entered the navy, and served under his former patron. It was his good fortune, at Nantes, to discover the earliest symptoms of the conspiracy of Amboise, which he immediately reported to the Government. After the death of Francis II. (December 1560), he accompanied the queen, Mary Stuart, to Scotland, and remained with her a year, during which time he made several journeys into England, and attempted to bring about a reconciliation between Mary and Queen Elizabeth. The wise and moderate counsels which he offered to the former were unheeded. In 1562, in consequence of the civil war in France, he returned there. He was employed against the Protestants in Brittany, was taken prisoner in an engagement with them and sent to Havre, but was soon after exchanged. In the midst of the excited passions of his countrymen, Castelnau, who was a sincere Catholic, maintained a wise self-control and moderation, and by his counsels rendered valuable service to the Government. He served at the siege of Rouen, distinguished himself at the battle of Dreux, took Tancarville, and contributed in 1563 to the recapture of Havre from the English. During the next ten years Castelnau was employed in various important missions;—first to Queen Elizabeth, to negotiate a peace; next to the duke of Alba, the new governor of the Netherlands. On this occasion he discovered the project formed by Condé and Coligny to seize and carry off the royal family at Monceaux (1567). After the battle of St

Denis he was again sent to Germany to solicit aid against the Protestants; and on his return he was rewarded for his services with the post of governor of Saint-Dizier, and a company of orderlies. At the head of his company he took part in the battles of Jarnac and Moncontour. In 1572 he was sent to England by Charles IX., to allay the excitement created by the massacre of St Bartholomew; and the same year he was sent to Germany and Switzerland. Two years later he was reappointed by Henry III. ambassador to Queen Elizabeth, and he remained at her court for ten years. During this period he used his influence to promote the marriage of the queen with the duke of Alençon, with a view especially to strengthen and maintain the alliance of the two countries. But Elizabeth made so many promises only to break them that at last he refused to accept them or communicate them to his Government. On his return to France he found that his château of La Mauvissière had been destroyed in the civil war; and as he refused to recognize the authority of the League, the duke of Guise deprived him of the governorship of Saint-Dizier. He was thus brought almost to a state of destitution. But on the accession of Henry IV., the king, who knew his worth, and was confident that although he was a Catholic he might rely on his fidelity, gave him a command in the army, and entrusted him with various confidential missions. Castelnau died at Jouiville in 1592. The *Mémoires* left by this great diplomatist rank very high among the original authorities for the period they cover, the eleven years between 1559 and 1570. They were written during his last embassy in England for the benefit of his son; and they possess the merits of clearness, veracity, and impartiality. They were first printed in 1621; again, with additions by Le Laboureur, in 2 vols. folio, in 1659; and a third time, still further enlarged by Jean Godefroy, 3 vols. folio, in 1731. Castelnau translated into French the Latin work of Ramus *On the Manners and Customs of the Ancient Gauls*. Various letters of his are preserved in the Cottonian and Harleian collections in the British Museum.

CASTELNAUDARY, the chief town of an arrondissement in the department of Aude, in France, 21 miles north-west of Carcassonne. It is finely situated on an elevation in the midst of a fertile and well-cultivated plain; and its commercial facilities are greatly increased by the Canal du Midi, which widens out, as it passes the town, into an extensive basin or reservoir, surrounded with wharves and warehouses. The principal buildings are the courthouses, the church of St Michel, the exchange, and the communal college. There are large manufactures of woollen and cotton goods, linen, leather, bricks, tiles, and earthenware; an extensive trade is maintained in lime, gypsum, grain, fruits, and wine; and the building of canal boats forms an important industry. By some authorities Castelnau is supposed to represent the ancient *Sostomagus*, and to receive its present name, which they regard as a corruption of the Latin *Castrum Novum Arianorum*, from the fact that it was rebuilt by the Visigoths, who were adherents of the Arian party. It is distinctly mentioned in the 12th century, and in 1212 it was remarkable as the scene of a great conflict between the counts of Toulouse and Foix and Simon de Montfort, in which the former were defeated. In 1229 the town was deprived of its ramparts; and in 1355 it was captured and burned by the Black Prince. In 1632 the duke of Montmorency was defeated here by the royal troops under Schomberg. Population in 1872, 7946.

CASTELO BRANCO (*i.e.*, White Castle), a town and bishop's seat of Portugal, in the province of Beira, on a hill near the Liria, 64 miles east by south of Coimbra. It is surrounded by walls flanked by towers, and has a ruined castle on the summit of the hill. Population about 5580.

CASTI, GIOVANNI BATTISTA (1721–1803), an Italian poet, was born of humble parents at Montefiascone, in the States of the Church, in 1721. He rose to the dignity of canon in the cathedral of his native place, but gave up his chance of church preferment to satisfy his gay and restless spirit by visiting most of the capitals of Europe. In 1782, on the death of Metastasio, he was appointed *Poeta Cæsario*, or poet-laureate of Austria, in which capacity he applied himself with great success to the opera bouffe; but, in 1796, he resigned this post, in order that he might not be hampered by political relations; and he spent the close of his life as a private gentleman at Paris, where he died in 1803. Casti is best known as the author of the *Novelle Galanti*, and of *Gli Animali Parlanti*, a poetical allegory, over which he spent eight years (1794–1802), and which, notwithstanding its tedious length, excited so much interest that it was translated into French, German, and Spanish, and (very freely and with additions) into English in W. S. Rose's *Court and Parliament of Beasts* (Lond. 1819). Written during the time of the Revolution in France, it was intended to exhibit the feelings and hopes of the people, and the defects and absurdities of various political systems. The *Novelle Galanti* is a series of poetical tales, in the *ottava rima*,—a metre largely used by Italian poets for that class of compositions. The sole merit of these poems consists in the harmony and purity of the style, and the liveliness and sarcastic power of many passages. They are, however, characterised by the grossest licentiousness; and there is no originality of plot,—that, according to the custom of Italian novelists, being taken from classical mythology or other ancient legends. Among the other works of Casti is the *Poema Tartaro*, a mock-heroic satire on the court of Catherine II., with which he was personally acquainted.

CASTIGLIONE DELLE STIVIERE, a town of Italy, in the province of Brescia, 20 miles north-west of Mantua. It has a castle, a theatre, and two fine churches, and was formerly the capital of a small principality dependent on the duchy of Mantua. In 1796 the Austrians, under Wurmser, were defeated there by Marshal Augereau, who was afterwards rewarded by Napoleon with the title of duke of Castiglione. Population, 5237. This town must not be confounded with Castiglione Fioretino, a flourishing township, about 11 miles south of Arezzo by rail, which is chiefly engaged in the culture of the silk-worm.

CASTIGLIONE, BALDASSARE (1478–1529), diplomatist and man of letters, was born at Casatico near Mantua, and was educated at Milan under the famous professors Mernla and Chalcondyles. In 1496 he entered the service of Lodovico Sforza, duke of Milan, returning to Mantua in 1500 when Lodovico was carried prisoner into France. In 1504 he was attached to the court of Guidobaldo Malatesta, duke of Urbino, and in 1506 he was sent by that prince on a mission to Henry VII. of England, who had before conferred on Federigo Malatesta, "the Good Duke," the most famous mercenary of his age, the order of the Garter. Guidobaldo dying childless in 1508, the duchy of Urbino was given to Francesco Maria della Rovere, for whom Castiglione, envoy at the court of Leo X. (Medici), obtained the office of generalissimo of the Papal troops. Charged with the arrangement of the dispute between Clement VII. (Medici) and Charles V., Castiglione crossed, in 1521, into Spain, where he was received with highest honours, being afterwards naturalized, and made bishop of Avila. In 1527, however, Rome was seized and sacked by the Imperialists under Bourbon, and in the July of the same year the surrender of the castle of Sant' Angelo placed Clement in their hands. Castiglione had been tricked by the emperor, but there were not wanting accusations of treachery against himself. He had, however, placed fidelity highest among the virtues of his ideal "courtier;"

and when he died at Toledo in 1529, it was said that he had died of grief and shame at the imputation. The emperor mourned him as "one of the world's best cavaliers." A portrait of him, now at the Louvre, was painted by Raphael, who disdained neither his opinion nor his advice.

Castiglione wrote little, but that little is of rare merit. His verses, in Latin and Italian, are elegant in the extreme; his letters (Padua, 1769–1771) are full of grace and finesse. But the book by which he is best remembered is the famous treatise, *Il Cortegiano*, written in 1514, published at Venice by Aldus in 1528, and translated into English by a certain Thomas Hoby as early as 1561. This book, called by the Italians *Il Libro d'Oro*, and remarkable for its easy force and undemonstrative elegance of style no less than for the nobility and manliness of its theories, describes the Italian gentleman of the Renaissance, under his brightest and fairest aspect, and gives a charming picture of the court of Guidobaldo da Montefeltre, duke of Urbino, "confessedly the purest and most elevated court in Italy." In the form of a discussion held in the duchess's drawing-room—with Elizabetta Gonzaga, Pietro Bembo, Bernardo Bibbiena, Giuliano de' Medici, Emilia Pia, and Ceretino the Unique among the speakers—the question, What constitutes a perfect courtier? is debated. With but few differences, the type determined on is the ideal gentleman of the present day. See Ginguéné, *Histoire Littéraire de l'Italie*, vi., vii.; and J. A. Symonds, *The Renaissance in Italy*, London, 1875.

CASTIGLIONE, GIOVANNI BENEDETTO (1616–1670), currently named in Italy Il Grechetto, and in France Lo Bénédette, a painter of the Genoese School, was born in Genoa, and studied for some time under Vandyck. He painted portraits, historical pieces, and landscapes, but chiefly excelled in fairs, markets, and rural scenes with animals. His paintings are to be found at Rome, Venice, Naples, Florence, and more especially Genoa and Mantua. He also executed a great number of etchings, which are spirited, free, and full of taste; Diogenes searching for a Man is one of the principal of these. The etchings are remarkable for light and shade, and have even earned for Castiglione the name of "a second Rembrandt." The *Presepio* (Nativity of Jesus) in the church of San Luca, Genoa, ranks among his most celebrated paintings; the Louvre also contains eight characteristic examples. In his closing years he lived in Mantua, painting for the court; here he received his name of "Grechetto," from the classic air of his pastorals, and here he died of gout in 1670. His brother Salvatore and his son Francesco excelled in the same subjects; and it is thought that many paintings which are ascribed to Benedetto are only copies after him, or perhaps originals by his son or brother.

CASTIGLIONE, CARLO OTTAVIO, COUNT (1784–1849), an Italian philologist of considerable reputation, was born at Milan of an ancient family. His principal work was done in connection with the Arabic and other Oriental languages; but he also performed good service in several other departments. In 1819 he published *Monete Cufiche del Museo di Milano*, and assisted Cardinal Mai in his *Ulphilæ partium ineditarum in Ambrosianis palimpsestis repertarum editio*. A learned *Mémoire géographique et numismatique sur la partie orientale de la Barbarie appelée Afrikia par les Arabes* appeared in 1826, and established his reputation. In 1829 he published by himself the Gothic version of the second epistle of Paul to the Corinthians; and this was followed by the Gothic version of the epistle to the Romans, the first epistle to the Corinthians, and the epistle to the Ephesians in 1834; by Galatians, Philippians, and 1 Thessalonians in 1835, and by 2 Thessalonians in 1839. His life was written by Biondelli, and appeared at Milan in 1856.

CASTILE (in Spanish, *Castilla*), an ancient kingdom of Spain occupying the central districts of the peninsula. For its history as a separate kingdom see the article SPAIN. The name Castile is derived from the existence of numerous forts (*castillos*) erected on the frontiers to afford protection from enemies. The northern part of the old kingdom, which was first rescued from the Moors, is called *Castilla la Vieja*, or Old Castile; the southern, more recently acquired, is called *Castilla la Nueva*, or New Castile. The length of Castile from north to south is about 300 miles; the breadth, about 160 miles; and the total area about 45,000 square miles, or nearly one-fourth that of Spain.

Old Castile is bordered on the N. by the Bay of Biscay, on the E. and N.E. by Biscay, Alava, Navarre, and Aragon, on the S. by New Castile, and on the W. by Leon and Asturias. It is divided into the provinces of Burgos, Logroño, Santander, Soria, Segovia, Avila, Palencia, Valladolid, and has an area of 25,409 square miles, and a population estimated in 1870 at 1,689,864 inhabitants. The country consists of vast plains, which form, between the Cantabrian chain in the north and the chain of Sierras stretching south-west from Aragon to Estremadura, a great table-land, of a height between 2500 and 4000 feet above the sea. The principal rivers are the Douro and the Ebro. The plains are barren and dry, with scarcely a tree, meadow, or spring of water; but the hills bordering the mountain ranges are well clothed with oak-forests. The climate is healthy, but subject to great extremes of cold and heat; frosts in the higher regions may last three months at a time. The soil is productive, but poorly cultivated; the harvests of wheat, however, are abundant. Wine and oil of inferior quality, and madder, are produced in considerable quantity, but fruits are scarce except at Bureba. The export trade is chiefly in wool, cattle, sheep, and wheat. The bad state of the roads (which are often impassable for mules), the insufficiency of railway communication, and the neglected condition of the Port of Santander, are great obstacles to commerce.

New Castile is bounded on the N. by Old Castile, on the E. by Aragon and Valencia, on the S. by La Mancha, on the W. by Estremadura. It forms the southern portion of the great central table-land of Spain, and comprises the provinces of Madrid, Toledo, Guadalajara, and Cuenca. The total area is 20,178 square miles, inhabited by a population estimated in 1870 at 1,277,123. The principal mountain ranges are the Sierra Guadarama in the north, and the Sierra Morena in the south. The chief rivers are the Tagus, Guadiana, Guadalquivir, Segura, and Xucar. The climate is more rigorous than that of Old Castile, and the mean temperature, on account of the elevation of surface, is not more than 59°; but the heat in summer is extreme in the valleys. The rainfall is not more than 10 inches in a year; the winds are dry and violent. The whole country presents the aspect of a barren dusty steppe, with patches of olive-trees here and there, and wheat, pea, and saffron fields. During the rainy season the vegetation is very luxuriant; but agriculture is in a backward state; the soil is fertile, but the rivers are not used for its irrigation. The total quantity of wheat raised is barely sufficient for the wants of the population. Hemp and flax and olive-trees are cultivated. Timber and fire-wood are becoming dearer, as the country is very little wooded. Honey is gathered in considerable quantities; and sheep, oxen, and mules are reared in great numbers. Iron, salt, and quick-silver are worked; the mineral resources are good, but ill developed. The manufactures are chiefly of woollen goods, plain and figured velvets, silks, satins, calicoes, stockings, earthenware, and cutlery.

The inhabitants of both Old and New Castile are a loyal

and manly race, preserving the primitive simplicity and pure Spanish, as well as the pride, of their forefathers. They are uneducated and inclined to bigotry, but naturally shrewd and intelligent. The tillage of the land and the pasturing of sheep are their chief employments.

CASTILLEJO, CHRISTOBAL DE (1494-1556), was born, according to Moratin, in Ciudad-Rodrigo. Attached at an early age to the household of Ferdinand of Austria, afterwards king of Bohemia and Hungary, and eventually emperor, Castillejo rose in the prince's service to the post of secretary, taking orders on the departure of his master from Spain, in which country he remained some time. A letter written during this period (1523) by Martin de Salinas to the treasurer Salamanca, in reply to one asking him to provide the treasurer with a secretary, bears flattering witness to the ability and temper of Castillejo, who is warmly recommended to the vacancy. It is not known whether he obtained this post. Certain it is, however, that he soon afterwards followed Ferdinand, and resumed his secretaryship, with but little profit, if we may judge from many passages in his verse, in which he deprecates his poverty and the forlorn position unaided merit held at court. He was several times in Venice, where certain of his opuscules were printed for smuggling into Spain,—Castillejo, like Torres Naharro, whose comedies and satires were also published in Italy, being on the *Index* of the Inquisition, on account of the strong anti-clerical bias of his satirical works. He died in a monastery near Vienna, two years before Ferdinand's recognition as emperor.

Castillejo was a voluminous writer of verse. His poems are worthy of note, not only on account of their intrinsic merit, but also as being the last manifestation of importance of the older Spanish School of poetry against the younger section under the leadership of Garcilaso de la Vega. That fine melodist and brilliant rhetorician, the Ronsard of Spain, seconded by Boscan and Hurtado de Mendoza, had introduced into his own land the rhythms and cadences employed in Italy; through him the sonnet, the canzone, the ottaves of the comic epics, and even the *terza rima* of the comedy itself had been transplanted into Spanish soil; and he and his followers had created a vocabulary of picked and exquisite terms which, passing through the hands of the magniloquent Herrera, was to end in the monstrous dialect of Gongora and his disciples. Against this revolution Castillejo set his face, fighting gallantly and unavailingly in defence of the antique metrical forms and structures. The use of these he never abandoned, save on one or two occasions when, for purposes of parody, he produced sonnets and octaves. In the poetry of Castillejo, which is written chiefly in "quintillas" and "coplas de pie quebrado," are all the qualities that make the older verse of Spain such pleasant reading—the graceful simplicity, the artless elegance, the fluency and spontaneity (which sometimes, however, degenerates into garrulity), the keen and homely mother wit, often gross but seldom offensive or cruel. He has, however, other qualities which are peculiar to himself, and which give him a place apart even among the school that may be said to end in him; his society verses are bright with a pleasant gossiping amiability; his satires are quick with a certain cynical sprightliness that makes them still amusing and attractive; while one at least of his poems, the "Dialogue between Himself and his Pen," overflows with a humorous tenderness that is extremely effective. Writing on anything and everything—"On a Green and Yellow Costume," "On the Wood Guaiacum," "On a Friend's Horse called Tristram,"—he of course produced a cloud of rhymes that are intolerable and to be avoided. Some of his "Villaneicos," "Letras," and "Motes," however, are charming in despite of years; a not infrequent note in them reminding the

reader somewhat of the quaint graces of Charles of Orleans, with whom in this fondness for elaborate trifles Castillejo may be said to have a certain affinity, though immeasurably his inferior in delicacy of touch and artistic restraint. His principal satires, "The Sermon against Love" and the "Dialogue of the Conditions of Women," are amusing and witty enough; while his "Galatea," an imitation of Ovid, must be regarded as one of the sweetest pieces of pastoral poetry in the whole range of Spanish letters, and, with the exception of the exquisite little anaerontic to Love, as the best of Castillejo's many poems.

The strong anti-clerical feelings of Castillejo, himself an ecclesiastical, have been already remarked. His satires were treated exceedingly ill on this account by the officers of the Inquisition, who did not scruple to excise large portions of them, and to fill up the gaps thus caused with sermons of a contrary tendency, the work of their own hack rhymesters, who had at this period a great deal of work to do of the same sort. The poems themselves are divided into three books, the first devoted to "Love," and the second to "Conversation and Pastime;" while the third is composed of moral and religious verses. The best text is that given in the *Biblioteca de Autores Españoles*, vol. xxxii., Madrid, 1832.

CASTING. See FOUNDED.

CASTLE (Saxon *castel*, Latin *castellum*, diminutive from *castrum*, whence the French *château* and *châtel*, as in Neufchâtel), an encampment, a fortress or place rendered defensible either by nature or art. The term is also often applied to the principal mansion of a prince or nobleman.

The frequent and protracted wars between neighbouring tribes and peoples which took place in early times must soon have rendered evident the expediency of erecting forts. These at first consisted only of earthen ramparts or rows of palisades, situated mostly on commanding eminences. With improved methods of assault and the advance of constructive art came erections of wood and stone, which by and by were flanked with towers and surrounded by a wall and ditch. Increased mechanical and architectural skill, while it made little alteration on the fundamental plan of such buildings, gradually introduced numerous contrivances for repelling assault, and rendering a great castle well-nigh impregnable.

Confining our narrative of the progress of castle-building to Britain, we notice first the hill-forts which are ascribed to the ancient Britons. Typical examples of them are the Herefordshire Beacon on the Malvern Hills, and the Barmekin of Echt in Aberdeenshire. The latter consists of the remains of two circular dry stone walls surrounded by three ditches. The inner wall seems to have been about 12 feet thick, and 300 yards in circumference, and contains five entrances all in an oblique direction. The outer wall, which is said to be more modern than the inner, is much more entire, and has no entrances through it. The ditches are about 9 feet broad.

Of the castella which the Romans erected in this country during their long occupation of it, Richborough Castle near Sandwich in Kent is almost the only relic. It is, from the evidence of coins found there, supposed to have been built, or at any rate completed, in the time of the Emperor Severus. The ruins at present form nearly three sides—the southern, western, and northern—of a rectangle, and it is commonly supposed that the fourth side, the eastern, facing the River Stour, has been destroyed by the giving way of the terrace on which it stood. The length of the southern wall is 260, of the western 460, and of the northern 410 feet.

The height of the walls varies from 10 to 30 feet; and their thickness, from 11 to 12 feet at the base, diminishes slightly towards the top. In the western and northern

walls are two openings which are usually denominated the decuman and postern gates. Round towers are said to have existed at the corners, and square ones at convenient distances along the walls, but no traces of them are now to be found. The walls, which are enormously strong and faced with regular courses of squared stones, consist of rows of boulders alternating with courses of bonding tiles. Nearly in the centre of the castle is the base of a cruciform building resting on a substructure of masonry, which is conjectured to have been the *augurale*, where the auguries were taken, and where was situated the *sacellum* for the reception of the ensigns.

Regarding the castles built by our Saxon forefathers our knowledge is scanty. They were probably not very numerous, and some of them were built principally of wood. Alfred, who did so much for the defence of the country, constructed several strongholds which his successors do not seem to have kept up or improved. At all events they offered little resistance to William the Norman, who, in order effectually to guard against invasions from without as well as to awe his newly-acquired subjects, immediately began to erect castles all over the kingdom, and likewise to repair and augment the old ones. Besides, as he had parcelled out the lands of the English amongst his followers, they, to protect themselves from the resentment of the despoiled natives, built strongholds and castles on their estates, and these were multiplied so rapidly that towards the latter end of the reign of King Stephen they amounted to 1115.

As the feudal system gathered strength, the lords of castles began to arrogate to themselves a royal power, not only within their castles, but likewise in their environs,—exercising jurisdiction both civil and criminal, coining money, and arbitrarily seizing forage and provisions for the subsistence of their garrisons, which they afterwards demanded as a right. Their insolence and oppression grew to such a pitch that, according to William of Newbury, "there were in England as many kings, or rather tyrants, as lords of castles;" and Matthew Paris emphatically styles them "nests of devils and dens of thieves." The licentious behaviour of the garrisons having at length become intolerable, it was agreed in the treaty between Stephen and Henry II., when the latter was duke of Normandy, that all the castles built within a certain period should be demolished; in consequence of which many were actually razed, but not the number stipulated.

The style of castle erected in England after the Conquest seems to have been that of buildings of a similar kind in France, such as the castles of Chambois, Domfront, Falaise, Nogent-le-Rotrou, Beaugency, Loches, Chauvigny, and many others. Like them, the Norman castle was commonly situated on an eminence, or on the bank of a river. The whole site of the castle, which was frequently of great extent and irregular figure, was surrounded by a deep and broad ditch, called the moat or fosse, which could be easily filled with water or left dry. In some of the later castles, before the principal entrances was placed an outwork called the barbican, which was a high wall surmounted by battlements and occasionally turrets to defend the gate and the drawbridge, which communicated therewith. The drawbridge across the moat was constructed of wood, and, by means of chains and weights, could be pulled up against the entrance, thus cutting off all communication with the outside. On the inside of the moat stood the outer bailey wall, about 8 or 10 feet thick, and from 20 to 30 feet high, surmounted by a parapet not less than 1 foot thick, with crenellated embattlements or embrasures. This parapet afforded protection to the defenders of the castle, who stood upon the wall, and through the crenelles discharged arrows,

darts, and stones at the besiegers. On the wall, and projecting out from it were built at proper distances square or round towers, sometimes called bastions, generally one story higher than the wall so as to command it. The lower story of the walls and towers was often built with a batter, or slope outwards to strengthen, and also to keep the assailants farther from, the walls. Thus the defenders were not compelled to lean far over the parapet, and expose their bodies to the archers of the enemy who were placed at a distance to guard those engaged in undermining the walls. In one of the towers and sometimes in the wall near a tower was the postern gate at a considerable distance from the ground. This gate was used for the egress of messengers during a siege. The principal entrance or main gate of the castle was of great strength, and was usually flanked with strong towers having embattled parapets. It was made of wood, cased with iron, and was rendered doubly secure by an iron portcullis which slid downwards in grooves in the masonry. Within the outer wall was a large open space or court called the outer bailey, bayle, or ballium, in which stood commonly a church or chapel. On the inside of the outer bailey and surrounded by a ditch stood another wall and parapet, with gate and towers similar to those on the outer wall. Round the inside of this inner wall were arranged the offices for the servants and retainers, the granaries, storehouses, and other necessary buildings. These constituted the inner bailey. Within all these was the keep, built sometimes on an artificial mound. It was a large, high, square or rectangular tower more strongly fortified than any of the other parts of the castle, and was the last resort of the garrison when all the outworks were taken. Its walls, from 10 to about 20 feet in thickness at the base, and diminishing towards the top, on which was placed an embattled parapet, often admitted of chambers and staircases being constructed in them. On each side of the keep there was usually a flat Norman buttress, and at the corners were embattled turrets carried one story higher than the parapet, as may be seen in the keeps of Rochester, Newcastle, &c.

was divided by a strong middle partition wall, in which were openings for communication with the different apartments. In this wall was the well of the castle, often of great depth, and with a shaft ascending through all the stories to the top of the keep. The several floors were of stone or wood. The basement floor contained the store-rooms and the dungeon for prisoners, and had no lights from the outside. On the first floor were situated the soldiers' apartments, guard-room, &c., lighted only by small loopholes. The second floor was taken up by the baronial hall in which the baron or governor and his retainers dined. The third floor contained, probably, the chapel and apartments of the governor and his family. The two upper floors were lighted by small round-headed Norman windows. Although there were unquestionably great variations in the structure of castles, yet the most perfect of them were built on the plan above described. As an illustration we give a ground-plan of Dover Castle copied by permission from *The Architect*.

FIG. 2.—Ground-Plan of Dover Castle.

The towers along the outer bailey wall (such as Avanches tower, Marshall's tower, and the Constable's tower in Dover Castle) were, in the case of royal castles, each protected by men of approved fidelity and valour, to whom estates were granted on condition of their performing castle-guard. Each had also to keep his particular tower in repair, and supply the requisite number of men to defend it during a siege. In process of time these services were commuted for annual rents, sometimes styled wardpenny and waytfee, but commonly castle-guard rents, payable on fixed days, under prodigious penalties called sursizes. At Rochester if a man failed in the payment of his rent of castle-guard on the feast of St Andrew, his debt was doubled every tide while the payment was delayed. These were afterwards restrained by an Act of Parliament made in the reign of Henry VIII., and finally annihilated, with the tenures by knight's service, in the time of Charles II. Such castles as were private property were guarded either by mercenary soldiers, or by the tenants of the lord or owner. Windsor, Warwick, Kenilworth, Conway, Carnarvon, and many others of the later Norman castles differ from the earlier ones chiefly in the structure of the keep, which contained in some instances an open quadrangular court, and had the chapel, the hall, and the state apartments arranged round the sides. The turrets at the corners and on the walls were of various shapes, round, square, and polygonal, and had embrasures and machicolations.

The machicolations were corbelled projections, with apertures between, down which stones could be thrown, or molten lead poured, on the assailants. The principal entrances were defended by large circular towers, with machicolations over the front of the gate, and sometimes more than one portcullis.

The Scotch castles were in general square or rectangular

FIG. 1.—Rochester Keep.

The entrance was on the first floor, and was reached by an open flight of steps, which could be readily defended, or by a staircase in a turret at one of the angles. The interior

keeps or peels, and depended for their security greatly upon their site. Some of them were situated on precipitous rocks on the sea-coast, such as Fast, Tantallon, Dunottar; others on islands in a lake or river, such as Lochleven and Threave. Edinburgh and Stirling castles, like many others in England and on the Continent, illustrate well one of the functions often discharged by fortresses, that of forming a nucleus for a village or city.

FIG. 3.—Machicolations and Battlemented Parapet.

As civilization advanced and the country enjoyed more peace and security, buildings were erected with a greater regard to comfort and elegance, though still retaining many of the features of a fortress, such as the moat, the drawbridge, and the gatehouse. Examples of these castellated mansions are seen in Caistor, Norfolk, and Herstmonceux, Sussex, erected in the 15th century. But it should not be forgotten that many of the castles of older date were by subsequent repairs, improvements, and adaptations so transformed in course of time as to resemble more modern structures. Castles of recent date are merely imitations of these with some of their features preserved for ornament.

See Grose's *Antiquities*, King's *Munimenta Antiqua*, Britton's *Architectural Antiquities*, Brayley's *Ancient Castles of England and Wales*, Beattie's *Castles and Abbeys of England*, Billings's *Baronial and Ecclesiastical Antiquities of Scotland*, M. Viollet-le-Duc's *Dictionnaire de l'Architecture*, M. de Caumont's *Abécédairre ou Rudiment d'Archéologie*, and many notices in various architectural and archaeological periodicals. (R. M'K.)

CASTLEBAR, a town of Ireland, the capital of the county of Mayo, situated on the river of the same name, 159 miles west by north of Dublin. It consists chiefly of a main street upwards of half a mile in length and a square in which are the county courts and public offices. It also possesses a jail, an Episcopal church, a Roman Catholic chapel, a lunatic asylum, a county infirmary, a linen hall, artillery and infantry barracks, and a workhouse. There are some breweries, and a considerable trade in linens and agricultural produce. Two newspapers are published in the town. The castle, which gives its name to the town, was a fortress of the De Burgh family; but the town itself is of more modern origin. In 1641 the castle was held for the Parliament by Sir Henry Bingham, but he was forced to surrender to Lord Mayo, and fell a victim, with all his garrison, to the fury and treachery of the besiegers. The massacre was afterwards avenged, in 1653, by the execution of Sir Theobald Burke (by that time Lord Mayo), who had been in command along with his father at the siege. In 1798 the town was occupied for some weeks by the French under General Humbert, who had defeated the English under Luke J. Hutchison in a conflict which is jocularly styled the "Castlebar Races." Population in 1871, 3508.

CASTLEREAGH, LORD. See LONDONDERRY, MARQUIS OF.

CASTLETOWN (in Manx, *BULLY CASHTEL*), the capital of the Isle of Man, and seat of the Manx Government, stands on the western side of Castletown Bay, 11 miles south-west of Douglas, on both banks of the Silverburn. It is neat and regularly built, and has a large square containing some handsome houses. In the centre of the town stands Castle Rushin, which owes its foundation to

the Danish chief, Guthred, in 960, and after serving for generations as the residence of the kings of Man, is now partly used as a prison and barracks. In its vicinity is the House of Keys, where the members of the Manx Parliament hold their sessions. The chief educational establishment is King William's College, situated about a mile and a half to the north of the town. It was originally erected about 1830-3; but a complete restoration was rendered necessary by fire in 1844, and it has since been enlarged, in 1862. Castletown also possesses a new town-house, a market-house dating from 1830, and several other public buildings; there are breweries, limekilns, and corn mills in the town and neighbourhood; and a small ship-building-trade is maintained. Population in 1871, 2320.

CASTOR AND POLLUX, in Greek and Roman mythology, were twin gods, also known under the name of Dioscuri (Διόσκουροι, from Ζεύς, Δίος, Jupiter, and κοῦροι, children) for, according to one myth, they were children of Jupiter and Leda, whose love the god had won under the form of a swan. In some versions Leda is represented as having brought forth two eggs, from one of which were born the mortal babes Castor and Clytemnestra, from the other the immortal Pollux or Polydeuces and Helen. According to others only the latter two were children of Zeus, and in Homer all are said to be children of Leda and Tyndareus, king of Sparta. We find also that the Dioscuri were specially revered among people of Dorian race, and that they were said to have reigned at Sparta. Müller therefore suggests that the myth arose from the apotheosis of certain human Tyndaridae, round whom gradually collected fables which originally referred to some ancient Peloponnesian deities.

The Dioscuri presided over public games, Castor being the god of equestrian exercise, Pollux the god of boxing; but both are usually represented on fiery steeds with spears and egg-shaped helmets crowned with stars. They were, besides, the patrons of hospitality; their willing and kindly aid was especially sought by travellers; they were θεοὶ σωτῆρες, ever ready to befriend all who paid them due honour. Their most important exploits are their invasion of Attica, to rescue their sister Helen from Theseus; their share in the hunting of the Calydonian boar, and in the Argonautic expedition, during which they married the daughters of Leucippus; and, lastly, their battle with the sons of Aphareus, in which Castor, the mortal, fell by the hand of Idas. Pollux, finding him dead after the battle, implored Jupiter to be allowed to die with him; but the father of the gods (says Homer) gave his brother life, on condition that both should, on alternate days, descend to Hades. According to another fable, the god marked his approval of their love by placing them together among the stars.

Though their worship was perhaps most carefully observed among people of Dorian origin, they were held in no small veneration at Rome. It was the popular belief in that city from an early period that the battle of Lake Regillus had been decided by their interposition. They had fought, it was said, armed and mounted, at the head of the legions of the commonwealth, and had afterwards carried the news of the victory with incredible speed to the city. The well in the Forum at which they alighted was pointed out, and near it rose their ancient temple. A great festival was kept in their honour on the Ides of Quintilis, believed to be the anniversary of the battle, and sumptuous sacrifices were offered to them at the public charge. It was further ordained that a grand muster and inspection of the equestrian body should be part of the ceremonial. All the knights, clad in purple and crowned with olive, were to meet at a temple of Mars in the suburbs. Thence they were to ride in state to the forum, where stood the temple of the twins. This pageant was during several

centuries one of the most splendid sights of Rome. In the time of Dionysius the cavalcade consisted of 5000 horsemen, all persons of fair repute and independent fortune.

CASTOR OIL, the fixed oil obtained from the Castor Oil Plant or Palma Christi, *Ricinus communis*, belonging to the Natural Order *Euphorbiaceæ*. The plant is a native of the East Indies, but it has been introduced, and is now cultivated in most tropical and in the warmer temperate countries. In size it varies from a shrubby plant to a tree of from 30 to 40 feet in height according to the climate in which it grows, being arborescent in tropical latitudes. On account of its very large beautiful palmate-peltate leaves, which measure as much as 2 feet in diameter, it is cultivated as an ornamental plant. In the south of England, with the habit of an annual, it ripens its seeds in favourable seasons; and it has been known to come to maturity as far north as Christiania in Norway. The fruit consists of a tricocccous capsule, covered externally with soft yielding prickles, and each cell develops a single seed. The seeds of the different cultivated varieties, of which there are a great number, differ much in size and in external markings; but average seeds are of an oval laterally compressed form, with their longest diameter about four lines. They have a shining, marble grey and brown, thick, leathery epidermis, within which is a thin dark-coloured brittle coat. The cotyledons readily separate, and show a large distinct leafy embryo. The oil is obtained from the seeds by two principal methods—expression and decoction,—the latter process being largely used in India, where the oil, on account of its cheapness and abundance, is extensively employed for illuminating as well as for other domestic and medicinal purposes. The oil exported from Calcutta to Europe, which is said to be “cold drawn and nearly tasteless,” is prepared by shelling and crushing the seeds between rollers. The crushed mass is then placed in hempen cloths and pressed in a screw or hydraulic press. The oil which exudes is mixed with water and heated till the water boils, and the mucilaginous matter in the oil separates as a scum. It is next strained, then bleached in the sunlight, and stored for exportation. A considerable quantity of castor oil of an excellent quality is also made in Italy; and in California the manufacture is conducted on an extensive scale. The following is an outline of the process adopted in a Californian factory. The seeds are submitted to a dry heat in a furnace for an hour or thereby, by which they are softened and prepared to part easily with their oil. They are then pressed in a large powerful screw-press, and the oily matter which flows out is caught, mixed with an equal proportion of water, and boiled to purify it from mucilaginous and albuminous matter. After boiling about an hour, it is allowed to cool, the water is drawn off, and the oil is transferred to zinc tanks or clarifiers capable of holding from 60 to 100 gallons. In these it stands about eight hours, bleaching in the sun, after which it is ready for storing. By this method 100 lb of good seeds yield about 5 gallons of pure oil.

Castor oil is a viscid liquid, almost colourless when pure, possessing only a slight odour, and a mild yet highly nauseous and disagreeable taste. Its specific gravity is .96, a little less than that of water, and it dissolves freely in alcohol, ether, and glacial acetic acid. It contains palmitic and several other fatty acids, among which there is one—ricinoleic acid—peculiar to itself. In 1864 Tuson isolated from the oil a principle which he denominated an alkaloid under the name of ricinine, and that substance has since been extracted from the leaves, which are used as galactagogues and emmenagogues. Castor oil forms a clean, light-coloured soap which dries and hardens well, having no tendency to deliquescence, and is free from smell. It has been recommended for medicinal use.

Castor oil is one of the most extensively useful of purgative medicines known; and the only one which, under certain circumstances, can with safety be administered. Its purgative properties were supposed by Soubeiran to be due to the presence of an acrid oleo-resin and to ricinolein, but the constituents of the oil have not yet been satisfactorily studied in their physiological relations. The seeds themselves, or the oil extracted by alcohol, owing to the larger proportion of the drastic principle they contain, act much more powerfully than the common oil. The nauseous taste of castor oil is the one great impediment to its use, and many methods have been suggested for overcoming its unpleasant flavour. The most common devices are—enclosing it in capsules, floating it in various palatable liquids, or preparing emulsions of the oil with such substances as dissolved gum-arabic and simple syrup.

CASTRÉN, MATTHIAS ALEXANDER (1813–1853), one of the greatest authorities on the ethnology and languages of the Northern Asiatic nations, was born at Tervola, in the parish of Kemi in Finland, on 20th November (2d December) 1813. His father, Christian Castrén, parish minister at Rovaniemi, died in 1825; and Matthias passed under the protection of his uncle, Mathias Castrén, the kindly and learned incumbent of Kemi. At the age of twelve he was sent to school at Uleåborg, and there he helped to maintain himself by teaching the younger children. On his removal to the Alexander's University at Helsingfors in 1830, he first devoted himself to Greek and Hebrew with the intention of entering the church; but his interest was soon excited by the language of his native country, and he even began before his course was completed to lay the foundations of a work on Finnish mythology. The necessity of personal explorations among the still unwritten languages of cognate tribes soon made itself evident; and in 1838 he was glad to join a medical fellow-student, Dr Ehrström, in a journey through Lapland. In the following year he travelled in Russian Karelia at the expense of the Literary Society of Finland; and in 1841 he undertook, in company with Dr Elias Lönnrot, the great Finnish philologist, a third journey, which ultimately extended beyond the Ural as far as Obdorsk, and occupied a period of three years. Before starting on this last expedition he had published a translation into Swedish of the Finnish epic of *Kalevala*; and on his return he gave to the world his *Elementa grammatices Syrjænae* and *Elementa grammatices Tscheremissæ*, 1844. No sooner had he recovered from the illness which his last journey had occasioned than he set out, under the auspices of the Academy of St Petersburg and the Helsingfors University, on an exploration of the whole government of Siberia, which resulted in a vast addition to previous knowledge, but seriously affected the health of the adventurous investigator. The first-fruits of his collections were published at St Petersburg in 1849 in the form of a *Versuch einer Ostjakischen Sprachlehre*. In 1850 he published a treatise *De affixis personalibus linguarum Altaicarum*, and was appointed professor at Helsingfors of the new chair of Finnish language and literature. The following year saw him raised to the rank of chancellor of the university; and he was busily engaged in what he regarded as his principal work, a Samoyedic Grammar, when he died on 7th May 1853. Five volumes of his collected works appeared from 1852 to 1858, containing, respectively—(1.) *Reseminnen från åren 1838–1844*; (2.) *Reseberättelser och bref åren 1845–1849*; (3.) *Föreläsningar i Finsk mytologi*; (4.) *Ethnologiska föreläsningar öfver Altaiska folken*; and (5.) *Smärre afhandlingar och akademiska dissertationer*. A German translation has been published by Anton Schiefner, who was also intrusted by the St Petersburg Academy with the editing of his manuscripts.

which had been left to the Helsingfors University. The Samoyedie Grammar (1854), a Samoyede Vocabulary (1855), a Tungusian Dictionary (1856), and studies on the Burintic (1857), the Koibalic and Karagassie (1857), and the Yenisei Ostiak and Kottian dialects have been published.

CASTRENSIS, PAULUS, a distinguished professor of civil and canon law, who studied under Baldus at Perugia, and was a fellow pupil with Cardinal Zabarella. He was admitted to the degree of doctor of civil law in the university of Avignon. It is uncertain when he first undertook the duties of a professorial chair. A tradition, which has been handed down by Panzirolus, represents him to have taught law during a period of fifty-seven years. He was professor at Vienna in 1390, at Avignon in 1394, and at Padua in 1429; and he filled at different periods a professorial chair at Florence, at Bologna, and at Perugia, but at what precise periods is not known. He was for some time the vicar-general of Cardinal Zabarella at Florence, and his eminence as a teacher of canon law may be inferred from the language of one of his pupils, who styles him "famosissimus juris utriusque monarca." His most complete treatise is his readings on the *Digest*, and it appears from a passage in his readings on the *Digestum Velus* that he delivered them at a time when he had been actively engaged for forty-five years as a teacher of civil law. His death is generally assigned to 1436, but it appears from an entry in a MS. of the *Digestum Velus*, which is extant at Munich, made by the hand of one of his pupils, who styles him "præceptor meus," that he died on the 20th July 1441.

CASTRES, the chief town of an arrondissement in the department of Tarn, France, 23 miles south-east of Alby, stands in a pleasant and fertile valley, on both sides of the Agout, here crossed by two bridges. The town is ill built, and the streets are narrow and crooked; but it has been much improved during the present century. The principal buildings are the town-hall, formerly the episcopal palace, which was built by Mansart, the churches of St Benoît (dating from the 17th century) and Notre Dame de la Plâté, a modern courthouse, two hospitals, barracks, a theatre, and an exchange. It is the seat of tribunals of primary instance and commerce, and of a Protestant consistory. Castres is celebrated for its manufactures, among which are woollen, linen, silk, and cotton stuffs, soap, leather, paper, and iron and copper wares. It has also a considerable trade. Dacier, Rapin, and Sabatier were natives of the town. Castres grew up round a Benedictine abbey, which is believed to have been founded in the 9th century. It was a place of considerable importance as early as the 12th century, and ranked as the second town of the Albigenses. During the Albigensian crusade it surrendered of its own accord to Simon de Montfort; and in 1356 it was raised to a countship by King John. On the confiscation of the possessions of the D'Armagnac family, to which it had passed, it was bestowed by Louis XI. on Boffilo del Giudice, but the appointment led to so much disagreement that the countship was united to the crown by Francis I. in 1519. In the wars of the latter part of the 16th century the inhabitants sided with the Protestant party, fortified the town, and established an independent republic. They were brought to terms, however, by Louis XIII., and forced to dismantle their fortifications; and the town was made the seat of the *chambre de l'édit*, or chamber for the investigation of the affairs of the Protestants, afterwards transferred to Castelnaudary (in 1679). The bishopric of Castres, which had been erected by John XXII. in 1317 was abolished at the Revolution. Population in 1872, 18,177 in the town, and 23,461 in the commune.

CASTRO, a seaport town of Italy, in the province of Otranto, and 10 miles south-west of the city of that name.

It is the seat of a bishopric, and has an old castle and a cathedral. Some export trade is carried on in corn, wine, and fish; but the harbour is accessible only to small vessels. The town is supposed to be the same with the *Castrum Minervæ* of the Romans, which possessed an ancient temple of the goddess whose name it bore, and was described by Virgil as the first place in Italy seen by his hero Æneas.

CASTRO DEL RIO EL REAL, a town of Spain in the province of Cordova. It is situated near the River Guadajocillo, about 16 miles south-east from Cordova, and contains several churches, schools, and hospitals, a handsome town-house, and a prison. Its population is about 9000, and the great majority are employed in agricultural pursuits. Its commerce is confined to the exportation of grain and oil, and its industry to coarse manufactures for domestic purposes.

CASTRO GIOVANNI, the ancient *Enna*, a town of Sicily, in the province of Caltanissetta, about a quarter of a mile south of Caltanissetta, which is situated on the railway between Catania and Girgenti. It lies almost in the centre of the island, and occupies a well-nigh impregnable position on the irregular but spacious summit of a hill which rises in precipitous cliffs to a height of 2790 feet. The town is in general in rather a dilapidated condition, but possesses a number of good ecclesiastical buildings. On the highest point of the hill-top stands the castle, built by Frederic II. of Aragon, probably on the site of the ancient temple of Ceres, which formed the boast of early Sicilians. The town is said by Stephanus of Byzantium to have been founded by Syracuse in the 7th century B.C.; but it first appears in history as a Sicilian city. It fell into the hands of Dionysius of Syracuse in 403; and it was afterwards subject to Agathocles. In 309 it was one of the first cities to join the Agrigentines in the war of liberation. During the first Punic war it was held for some time by the Carthaginians, and subsequently betrayed to the Romans; and during the second it was delivered to massacre and plunder by the Roman governor Pinarius, who feared a revolt of the citizens. As headquarters of the insurrection of the slaves from 134 to 132 B.C., it defied the consul Rupilius till treachery came to his aid. From the spoiliations of Verres it suffered severely, and its importance gradually diminished under the empire. In 837 the Saracens made a vain attempt to take it by storm; but in 859 it was betrayed into the hands of Abbas ibn Fahd. In 1080 the Normans entered into possession, and the proof of their occupation is still to be found not only in the remains of their buildings but also in the light hair and blue eyes of many of the present inhabitants. Of Roman architecture there are few remains, and the identification of the ancient site assigned to the myth of the rape of Proserpine rests on very uncertain evidence. The present form of the name Castro Giovanni appears to have arisen simply from an erroneous interpretation of the Sicilian Castro Janni, which is really nothing more than *Castrum Ennæ*. Population, about 14,000.

CASTRO NUOVO, a town of Sicily, in the province of Palermo, 25 miles north of Girgenti. In the vicinity there are extensive quarries of coloured marble, which have been worked since the time of the Romans. Population, 4300.

CASTRO REALE, a city of the province of Messina, in the Island of Sicily, situated on a triangular and rocky mountain about 11 miles south of Milazzo. The climate is salubrious; and excellent wine and oil are produced in the district. Population, about 7700.

CASTRO URDIALES, a seaport town of Spain, in the province of Santander, well known to sailors for the shelter which it affords from storms in the Bay of Biscay. It was destroyed by General Foy in 1813, but has been rebuilt,

fortified, and greatly improved. The most remarkable buildings are the castle and the hermitage of Santa Ana. Its fisheries are considerable, and iron-ore and calamine are exported. Population, 3391.

CASTRO, GUILLEN DE (1569-1631), a Spanish dramatist of note, was a Valencian by birth, and early enjoyed a reputation as a man of letters. In 1591, with Aguilar and Artieda, he was a member of the *Nocturnos*, a brilliant Spanish imitation of the Italian *Accademia*. At one time a captain of horse, at another the protégé of the munificent Benevente, viceroy of Naples, of whom he received the governorship of a Neapolitan fortress, patronized and splendidly pensioned by the duke of Osuna and the count-duke Olivarez, Guillen de Castro would seem to have made friends with his pen as quickly and as easily as he unmade them by his sour humour and discontented obstinacy. Little is known of the literary part of his life. He lived at Madrid, and wrote for the stage. It is certain, too, that he long enjoyed the friendship of Lope de Vega, who dedicated a play to him in flattering terms, and whom he assisted at the famous festival of the Canonization of San Isidro, where he won a prize in the literary tournament contested by Jauregui, Calderon, Juan de Montalvan, and others. He is said, moreover, to have died in such poverty as to have owed his funeral to charity. Guillen de Castro wrote some forty plays, in all of which he showed himself a follower of Lope de Vega, and a thorough Spaniard in instinct and idea, and in some of which great passions and stirring scenes are treated worthily and well. The best of them are perhaps—(1) *Engañarse Engañando*, (2) *Pagar en propia Moneda*, and (3) *La Justicia en la Piedad*. But the drama that has made Guillen de Castro's reputation European is *Las Mocedades del Cid*, to the first part of which Corneille was so largely indebted for the materials of his own renowned tragedy. The two parts of this play, like all those of Castro, have the genuine ring of the old songs of the *Romanceros* about them; and, from their intense nationality, no less than for their rough poetry and sweet versification, were, doubtless, among the most popular pieces of their day.

CASTRO, INEZ DE (died 1355), called *Collo de Garça*, i.e., "Heron's Neck," was born in Spanish Galicia, in the earlier years of the 14th century. Tradition asserts that her father, Don Pedro Fernandez de Castro, and her mother, Doña Aldonça Soares de Villadarc, a noble Portuguese lady, were unmarried, and that Inez and her two brothers were consequently of bastard birth. Educated at the semi-Oriental provincial court of Juan Mannel, duke of Peñafiel, Inez grew up side by side with Costança, the duke's daughter by a scion of the royal house of Aragon, and her own cousin. After refusing several crowned heads in marriage, Costança was at last persuaded to accept the hand of the Infante Dom Pedro, son of Alphonso the Proud, king of Portugal. In 1341 the two girls left Peñafiel; Costança's marriage was celebrated in the same year, and the young Infanta and her cousin went to reside at Lisbon, or at Coimbra, where Dom Pedro conceived that luckless and furious passion for Inez which has immortalized them.

Morganatic marriages among the great were rather the rule than the exception in those times. The only person, therefore, who suffered in the contemplation of the lawless alliance between the Infante and Inez was Costança. In 1345, however, the Infanta died in childbed, and the

widower was left in undisturbed possession of his mistress. A wayward violent man, bold and irresolute, of terrible passions, but subject to strange lapses of will, Dom Pedro, doubtful, perhaps, of the illegitimacy of Inez, which debarred her from succession to the throne, took no steps to improve her position in the world's eye till 1354, nine years after Costança's death, when he married her in presence of the bishop of Guarda, and of several of the members of their household. No contract of marriage, however, nor documentary proof of any kind was created for this extraordinary occasion. In 1361 Dom Pedro, then king of Portugal, swore solemnly to Castanheda, that he had been lawfully wedded to Inez; but in 1385 João De Regras had no difficulty whatever, in the absence of written evidence, in setting aside the title of her descendants to the throne.

Alphonso the Proud feared for his grandchild and his kingdom's peace. The Castro family, as much dreaded in Spain as in Portugal, with Inez ready to mount the throne and her brother Pedro Fernandez de Castro rising daily higher in popularity and importance, had many enemies,—among others, three gentlemen, Alvaro Gonçalves, Pedro Coelho, and Diogo Lopes Pacheco. These men, hateful to and fearful of Pedro Fernandez, are said to have used their influence with Alphonso to persuade him to strike down the family through Inez. The old king listened, refused, wavered, and ended by yielding. He went in secret to the palace at Coimbra, where Inez and the Infante resided, accompanied by his three familiars, and by others who agreed with them. The beauty and tears of Inez disarmed his resolution, and he turned to leave her; but the gentlemen about him had gone too far to recede. Inez was stabbed to death, and was buried immediately in the Church of Santa Clara.

The Infante raised at once the flag of revolt against his father, and was only appeased by the concession of a large share in the government. The three murderers of Inez were sent out of the kingdom by Alphonso, who knew his son too well not to be aware that the vengeance would be tremendous as the crime. They took refuge in Castile. In 1357, however, Alphonso died, and the Infante was crowned king of Portugal. Pedro the Cruel, his nephew, reigned over Castile; and the murderers were given up as soon as required. Diogo Lopes escaped through the gratitude of a beggar to whom he had formerly done a kindness; but Coelho and Gonçalves were executed, with horrible tortures, in the very presence of the king.

The story of the exhumation and coronation of the corpse of Inez has often been told. It is said that to the dead body, crowned and robed in royal raiment, and enthroned beside the king, the assembled nobility of Portugal paid homage as to its queen, swearing fealty on the withered hand of the corpse. The gravest doubts, however, exist as to the authenticity of this story; Fernão Lopes, the Portuguese Froissart, who is the great authority for the details of the tragedy of the death of Inez, with some of the actors in which he was personally acquainted, says nothing of the ghastly and fantastic ceremony, though he tells at length the tale of the funeral honours that Pedro the king bestowed upon his wife. Inez was buried at Alcobaca with extraordinary magnificence, in a tomb of white marble, surmounted by her crowned statue; and near her sepulchre Pedro caused his own to be placed. The monument, after repeatedly resisting the violence of curiosity, was broken into in 1810 by the French soldiery; the statue was mutilated, and the yellow hair was cut from the broken skeleton, to be preserved in reliquaries and blown away by the wind. The children of Inez shared her habit of misfortune. From her brother, however, Alvaro Perez da Castro, the house regnant of Portugal directly descends.

See Fernão Lopes, *Chronica del Rey Dom Pedro*, 1735; Camoens, *Os Lusíadas*; Antonio Ferreira's *Ines de Castro*,—the first regular tragedy of the Renaissance after the *Sofonisba* of Trissino; Luis Velez de Guevara, *Reinar despues de morir*, an admirable play; and Ferdinand Denis, *Chroniques Chevaleresques de l'Espagne et du Portugal*.

CASTRO, João de (1500–1548), called by Camoens *Castro Forte*, fourth viceroy of the Portuguese Indies, was the son of Alvaro de Castro, civil governor of Lisbon. A younger son, and destined therefore for the church, he became at an early age a brilliant humanist, discovered also a profound capacity for mathematics. The latter he studied under Pedro Nunez, in company with the Infante Dom Luis, son of Emmanuel the Great, with whom he contracted a life-long friendship. At eighteen he went to Taugiers, where he was dubbed knight by Duarte de Menezes the governor, and where he remained several years. In 1535 he accompanied Dom Luis to the siege of Tunis, where he had the honour of refusing knighthood and reward at the hands of the great emperor Charles V. Returning to Lisbon, he received from the king the small commandship of São Paulo de Salvaterra in 1538. He was exceedingly poor, but his wife Lenor de Continho, a noble Portuguese lady, the exact date of whose marriage with him is not known, admired and appreciated her husband sufficiently to make light of their poverty. Soon after this he left for the Indies in company with his uncle Garcia de Noronha, and on his arrival at Goa enlisted among the *aventureiros*, "the bravest of the brave," told off for the relief of Diu. In 1540 he served on an expedition under Estabão de Gama, by whom his son, Alvaro de Castro, a child of thirteen, was knighted, out of compliment to him. Returning to Portugal, João de Castro was named commander of a fleet, in 1543, to clear the European seas of pirates; and in 1545 he was sent, with six sail, to the Indies, in the room of Martin de Souza, who had been dismissed the viceroyalty. The next three years were the hardest and most brilliant, as they were the last, of this great man's life,—years of battle and struggle, of glory and sorrow, of suffering and triumph. Valiantly seconded by his sons (one of whom, Fernão, was killed before Diu) and by João Mascarenhas, João de Castro achieved such popularity by the overthrow of Mahmud, king of Cambodia, by the relief of Diu, and by the defeat of the great army of Adhel Khan, that he could contract a very large loan with the Goa merchants on the simple security of his moustache. These great deeds were followed by the capture of Broach, by the complete subjugation of Malacca, and by the passage of Antonio Moniz into Ceylon; and in 1547 the great captain was appointed viceroy by João III., who had at last accepted him without mistrust. He did not live long to fill this charge, expiring in the arms of his friend, St Francis Xavier, 6th June of the following year. He was buried at Goa, but his remains were afterwards exhumed and conveyed to Portugal, to be reinterred under a splendid monument in the convent of Bemfica.

See Jacinto Freire de Andrade, *Vida de D. João de Castro*, Lisbon, 1651,—English translation, by Sir Peter Wyche, 1664; João de Barros, *Decada segunda da Asia*, bk. viii.; *Roteiro de Dom João de Castro*, Paris, 1833. The last is important as fixing the position of João de Castro among geographers.

CASTROVILLARI, a town of Italy, in the province of Calabria Citra, 7 miles W.N.W. of Cassano. It stands on an eminence surrounded by lofty mountains, and the modern portion contains several handsome streets. The massive castle is supposed to belong to the Norman period. The town carries on a considerable trade in cotton, wine, silk, and fruits, and has about 9400 inhabitants.

CASTRUCCIO CASTRACANI (1283–1328) was by birth a Lucchese, and by descent and training a Ghibelline.

He belonged to the family of Antelminelli; and being exiled at an early age with his parents and others of their faction by the Guefs, then in the ascendant, and orphaned at nineteen, he served as a soldier in England, France, and Lombardy, till he returned to Italy in 1313, and was chosen chief by the Ghibellines, who had again obtained the mastery. To avenge himself on the vanquished faction he called in Uguecione da Faggiuola, lord of Pisa, who treated him ill and perfidiously, putting him in irons and sacking the city of Lucca, in spite of strenuous support received from Castruccio in many arduous enterprises, particularly in that of Montecatini. An insurrection of the Lucchese leading to the expulsion of Uguecione and his party, Castruccio regained his freedom and his position, and the Ghibelline triumph was presently assured. Elected governor of Lucca in 1316, he warred incessantly against the Florentines,—becoming the faithful adviser and staunch supporter of the Emperor Louis V., whom he accompanied to Rome, and who made him duke of Lucca, count of the Lateran Palace, and senator of the empire. Castruccio was excommunicated with his master by the Papal Legate, in the interest of the Guefs, and died soon afterwards, leaving several young children, whose fortunes were wrecked in the Guef triumph consequent on their father's death.

Machiavelli's *Life of Castruccio* is a mere biographical romance; it was translated into French, with notes, by Dreux de Radier in 1753; See Nicolas Negrini, *Vita di Castruccio*, Modena, 1496; Sismondi's and Leo's Histories of the Italian Republics; and Wieland, *Dissertatio de Castruccio*, Leipsic, 1779.

CASUISTRY is the application of general moral rules to particular cases, but the word is specially limited to the consideration of cases of possible dubiety, since it is only where difficulty exists that formal treatment is necessary. Any important development of casuistry can only take place under a government by laws expressed in definite precepts; but the development may have its origin in either of two opposite causes, or in a combination of the two—in the desire, namely, to fulfil the laws, or in the desire to evade them, or in a conflict of these desires.

Of these principles a remarkable illustration is given by the Jews. Governed as they were by the written precepts of Moses, they were continually confronted by questions which did not clearly come under any one rule, but of which a solution was required by their extreme reverence for the smallest dicta of their code. This worship of every jot and tittle of the law, which was the most remarkable characteristic of their conscientiousness, determined the nature of their casuistry. It was exact, detailed, unbending, and, though often wise and noble, often useless and merely external. Thus it forbade the wearing of a girdle on the Sabbath, decided to a yard how far one might walk on that day, and declared the consequences of an oath by the gift on the altar to be most serious, while an oath by the altar itself was perfectly safe. Its loosest requirements were those which concerned marriage, for it was practically possible to divorce a wife at will. Of these rules some may be found in the Apocrypha, but their great repository is the encyclopædic Talmud, which entered into the minutiae of conduct with a detail which tended to prevent real obedience to great laws, and which was disastrous to individual freedom. It must, however, be remembered in considering the religious casuistry of the Jews that—as is also remarkably the case with the Mahometans—their religious code was intended to be at the same time their civil law, and that, consequently, part of their casuistry is comprised in our law-books. In fact, the task of our judges is to solve questions of legal casuistry, and the precedents which they make are, so far, comparable to traditions of the elders.

The early Greeks and the early Romans, in the bright joyousness or the laborious activity of objective life, fully occupied by the pleasures of art or the business of war and politics, with no minutely-detailed code or body of traditions to guide them, troubled themselves little about such problems. When, however, the Greek philosophers and their Roman followers developed moral systems, attention began to be given to this department; at length, such questions as how far suicide is justifiable, or whether duty to the state is more important than duty to a friend, became favourite subjects of debate; and, during the first two centuries of the Christian era, elaborate treatises on the subject were produced by the famous Stoic philosophers Epictetus, Seneca, and M. Aurelius.

Christianity brought in a new method of settling casuistical questions—a method directly opposed to that of most of the Jewish scribes, in the midst of whom it had its origin, and consisting in an appeal to the true spirit of great principles. Naturally this method would have left particular cases to the decision of each man's conscience; but the extreme recoil from reckless self-indulgence which gave birth to the monastic ascetic system produced a new kind of casuistical literature. It found its first great representative in Tertullian, a contemporary of M. Aurelius, with whom nearly all sin was mortal, one repentance at most being possible after baptism. The same type of casuistry was taught by others of the fathers, but with the greatest acuteness and power by Augustine, who laid special stress upon the subjective or spiritual side of Christian ethics, insisting upon the principle that the moral worth of action depends upon the disposition of the agent as much as upon the objective nature of the act.

In the Roman Catholic Church, the practice of confession gave rise to a system of casuistry, expressed in the *Libri Penitentiales*, which were intended to guide the confessor as to the imposition of penance and the giving of advice. Among the most important of these are the *Summæ* of Raimund of Pennafort, Angelus, Antonius Augustinus, Pacificus, and Prierias, the work of the last (who was a vigorous opponent of Luther) being an alphabetical compilation from those of his predecessors. Later examples are Amort's *Dictionarium casuum conscientie* (1784), and Sobiech's *Compendium theologicæ moralis pro utilitate confessoriorum* (1824). Indeed, throughout the Middle Ages, the doctrines of the church being universally accepted as the supreme rules of conduct, the casuistical was the department of moral science which was best developed. In Petrus Lombardus, in Alexander of Hales, and in Aquinas's famous treatise, the *Secunda Secundæ*, we find the uncompromising strictness of the ancient fathers but slightly modified. Abelard, though earlier, took a more indulgent view, but his teaching was condemned by the church, in the synod of Sens (1140).

One of the most favourable conditions for the growth of a system of casuistry is that in which a people, having lost its reverence for the law it once held supreme, and ceased to find obedience tolerable, does not yet dare to deny its authority. Such was the condition in which, during the 16th century, there took place the worst development of casuistry which the world has seen. Men no longer were willing that their liberty should be repressed by the dead rules of a corrupt church, and the Jesuits, animated by the single object of adding to the power of their order, were always ready to make concessions and to soften disagreeable requirements. The most remarkable doctrine which they promulgated—a doctrine which it is hard to believe that any one ever ventured to assert—is that of "Probabilism," according to which any opinion which has been expressed by a "grave doctor" may be looked upon as possessing a fair amount of probability, and may, therefore, be safely followed, even

though one's conscience may insist upon the opposite course. With principles so liberal it was hard if one could not find an authority to his mind among Escobar, Suarez, Sanchez, Velasquez, Molina, Bauny, Busenbaum, Toletus, Filiutius, Less, Ponce, and an innumerable host of other "grave" and, as a rule, obliging doctors. Such was the popularity of some of their works that Busenbaum's *Medulla casuum conscientie* (1645) ran through fifty-two editions, and Escobar's *Theologia Moralis* (1646) through forty. One of the most amusing of their ruses was that by which they avoided the condemnation of usury. That "money should breed money" was regarded universally in those days as unnatural; but borrowing was necessary, and no one could be expected to lend without being paid for his risk, and for the use of his capital. The remedy for the Jesuit was easy. There is no sin if you only call the payment not interest but "fair profit;" or if you look upon it as a grateful return by the borrower for the favour done him; or, thirdly, if you prefer it, you can avoid the least appearance of evil by making a "Mohatra" bargain, that is, you sell to the person who wants money a quantity of goods, which he at once sells to you again at a lower rate. For these devices, however, the Jesuits are to be judged the less hardly, since almost all moralists found it necessary to evade the mistaken law. It was mainly by their teaching on the fundamental question of the duty of veracity that they made themselves a by-word and a reproach among men. To settle the limits of this duty is, indeed, one of the most difficult problems in practical ethics; but the Jesuits removed it entirely from the category of obligation. Thus Filiutius and others, from the principle that it is the intention which determines the quality of the action, argue that lying can be avoided by mental reservation, by equivocation, or by introducing words *sotto voce*, and that promises are not binding when the promiser in making them had no intention to bind himself. Equally notorious were their views on murder, which was authorized in revenge for a box on the ear, or to prevent the loss of a trifling sum; and with regard to some other questions, they entered into such prurient details that their bitterest enemies would not quote their words even for the purpose of condemning them. In short, virtue, according to Father Le Moine's *Devotion made Easy*, is not at all the "cross-tempered dame" men represent her as being. The rites and requirements of the church also were modified to suit the taste of the people. For example, if a whole mass be found wearisome, greater expedition can be obtained by having different parts performed simultaneously; and in his *Paradise opened to Philagio in One Hundred Devotions to the Mother of God, easily practised*, Father Bauny shows how easily the heart of the Virgin may be won; a prayer once a day, or even the wearing of an amulet, is enough; nor is it necessary, or, indeed, becoming, that the favoured worshipper should give his heart—"that poor little slave"—to his benefactress as a token of his gratitude. It was impossible that absurdities such as these could fail to bring upon their authors the severest punishment. War was declared against them by the great Jansenist, Antoine Arnauld; and in 1656 and 1657 Pascal attacked them with an incisive wit, the edge of which none of their attempts could turn. The order became a jest; the clergy were aroused to examine the ponderous folios which contained its casuistry, and to condemn them in a general assembly. The attack was afterwards followed up by the polished satire of Boileau, and by a second exposure of the *Morale des Jesuites* by Nicole Perrault (1667); and the influence of the *Provincial Letters* was at once spread far and wide by means of their immediate translation into Latin, Italian, German, Spanish, and English. It was in vain that the Pope condemned them (September 1657);

the attempts of Pirot and other Jesuits to justify the base maxims they exposed, only increased the disgrace of the order; and Father Daniel's endeavour to prove them inaccusato was a complete failure. The chief Roman Catholic casuists since that time are St Ignatio (who produced a complete treatise in 1707, and an *Ethica Amoris* in 1709), Stattler (1782), Lambertini (1766-1794), and Amort and Sobiech, who have been already mentioned.

The casuistry of the Reformers was similar, in origin, to that of the early fathers; and, with the marked exception of the question of celibacy, the two systems greatly resemble one another in their severity. This strictness was most extreme in the Calvinistic Church, as is displayed in the stern rules of its founder, and in the works of the German Divines (who, in fact, usually follows Augustine), of the English Perkins, and the Dutch Amesius. A more genial spirit prevailed in the Lutheran Church, which produced the *Consilia* of Melancthon, and the treatises of Baldwin of Wittenberg, Olearus, Oslander, and Spener. In the *Pia Desideria* of the last we find the commencement of a more ascetic but specially subjective casuistry, founded upon the pietism of Thomas à Kempis. During the 17th century, several other Protestant works on casuistry appeared in England. Those of Bishops Hall and Barlow are not marked by much power. Perkins's *Cases of Conscience* (1606), starting from a discussion of the authority of Scripture and the nature of the Godhead, of repentance and the sacraments, arrives at conclusions which often display vigorous sense, and always a straightforward and even stern honesty. Thus he declares that a promise, though extorted under compulsion or by means of deceit, is binding so long as the loss to be sustained is merely temporary and private; and he condemns the striving for more riches than is necessary for the health of the body, the culture of the mind, and the satisfaction of one's obligations to one's family and to others. His most fanciful argument is that in which he founds the validity of an oath by a creature on the curious ground that "God is seen" (*i.e.*, manifests himself) "in the creature." The still more famous Latin treatise *De Obligatione conscientie* (1660)—of which the best known section, the *De Juramenti Obligatione* appeared separately in 1617—by Sanderson, professor of theology at Oxford, is distinguished by an equal directness of moral aim, and by much learning and vigour. But the most renowned of all, Jeremy Taylor's *Ductor Dubitantium* (1660) has not the merit of similar clearness; as guides of conscience he mixes up the laws of revelation and nature, the laws ecclesiastical and civil of princes and governors, and "the fame or the public reputation of things, expressed by proverbs, &c.," while the place of careful original thought is often taken by profuse quotations.

During the last two centuries, the study of morals has developed itself in a totally different direction. Free discussion being opened up as to the fundamental questions of religion and morality, modern writers on ethics more generally content themselves with the treatment of great principles, without laying down specific rules for their practical application. (T. M. W.)

CASWALL, HENRY, D.D. (1810-1870), was born at Yateley, Hampshire, and educated chiefly at the grammar school of Chigwell, Essex. At the age of eighteen he went to the United States, and graduated in arts at Kenyon College, Ohio. After being engaged for several years as a parish minister and a professor of theology in America, he returned to England in 1842, obtained a private Act of Parliament recognizing the validity of his ordination in the United States, was appointed to the vicarage of Figheldean, Wiltshire, and became proctor in Convocation

for the diocese of Sarum, and prebendary of Salisbury Cathedral. He received the honorary degree of M.A. from the university of Oxford, and that of D.D. from Trinity College, Hartford, Connecticut. Caswall went back to the United States about two years before his death, which occurred at Franklin, Pennsylvania, December 17, 1870. The main object of his life was to promote the consolidation and to increase the power of the great religious organization connected with the English Reformation. His principal work is *America and the American Church*, 1839; 2d edition, 1851. He also wrote two works on Mormonism; *Scotland and the Scottish Church: The Western World Revisited*, 1854; and *The Martyr of the Pongas*, a memoir of the Rev. H. J. Seacock.

CAT, a name applied in its widest sense to all feline animals, but generally restricted to a few of the smaller species which approximate more or less closely to the domestic form. Of undomesticated species the best known is the wild cat (*Felis catus*), inhabiting the most inaccessible mountain fastnesses, and the deepest recesses of the forests of Central and Northern Europe and Asia. It attains a length of 3 feet including the tail, is of a yellowish grey colour above and whitish beneath, with a dark streak extending along the back to the origin of the tail, and with indistinct transverse bands on the sides. Its tail is bushy and of equal thickness throughout, annulated and tipped with black. The wild cat was formerly abundant throughout the wooded districts of Britain, but is now confined to Wales, the mountainous parts of the north west of England, and the Highlands of Scotland, where, owing to the increased attention now paid to the preservation of game, it is being rapidly exterminated by trap and gun. It forms its nest in rocky crevices, or in the hollows of trees, and has been known to make use, for this purpose, of the nests of the larger birds. It is nocturnal in its habits, prowling by night in search of the mammals and birds which form its food, and thus doing immense damage in districts well stocked with game. The fierceness of its disposition, its strength, and its agility are well known; and although it does not seek to attack man, yet when disturbed in its lair, or when hemmed in, it will spring with tiger-like ferocity on its opponent, every hair on its body bristling with rage. "I never saw an animal fight so desperately," says Mr Charles St John (*Wild Sports of the Highlands*), "or one which was so difficult to kill." In country districts specimens of the domestic cat run wild are by no means uncommon, for, having once tasted wild animal food, hares and rabbits are ever afterwards preferred to rats and mice, and when the house cat thus takes to hunting there are few animals more destructive to poultry and game. In some instances they have been known to hunt regularly in the woods and yet retain sufficient domesticity to carry home their prey before devouring it; and notwithstanding the Latin proverb—

"Catus amat pisces sed aquas intrare recusat,

they have been known to overcome their aversion to water in order to gratify their taste for fish. The offspring of such semi-wild forms gradually assume a uniform colouring not unlike that of the wild cat,—a similarity which led to the supposition that the house cat was but a domesticated form of *Felis catus*. The greater size, however, of the latter, the uniform thickness of its tail—a peculiarity which never reappears in any of the domestic varieties, nor in those which have returned to the wild state—along with the fact of the great scarcity of house cats and the high value set upon them throughout Europe during the Middle Ages, when the wild form was everywhere abundant, may be

held to prove that the domestic cat is specifically distinct from the wild form of our woods. Its origin, like that of many other domestic animals, is sufficiently obscure to have become a matter of more or less probable conjecture. Reference is made to it in Sanskrit writings 2000 years old, and still more ancient records of it are to be found in the monumental figures and cat mummies of Egypt. The latter, according to De Blainville, belong to three distinct species, two of which are said to be still found, both wild and domesticated, in parts of Egypt. The Gloved Cat of Nubia (*Felis maniculata*), which also occurs as a mummy, approaches most nearly in size, and in the tapering form of the tail, to the domestic cat, but Professor Owen has shown that there are peculiarities in the dentition of this species, sufficient to invalidate its claim to be considered the ancestor of the domestic form. The difficulty of recognizing this ancestor in any single wild species has led many naturalists, including Temminck, Pallas, and Blyth, to the conclusion that *Felis domestica* is the product of many species commingled; and whatever weight may be attached to this view, there is sufficient evidence to show that domestic cats in different parts of the world have been greatly modified by frequent crossings with such wild species as occur in those parts. In the north of Scotland at the present day, the native species is believed occasionally to cross with the house cat, the product living in the houses. Such crosses would, no doubt, be much more frequent in ages when the wild cat was superabundant throughout Europe, and it is evidently owing to this, that, as Mr Blyth states, the affinity of the ordinary British cat to *Felis catus*, as compared with any Indian tame cat, is manifest. The latter, according to the same authority, has crossed with no fewer than four Indian wild species, and a tame specimen lately added to the British Museum, agreed, in Dr Gray's opinion, in almost every character with the Indian wild species *Felis chaus*. Similar instances of the crossing of native species with the domestic form have been noted in Algeria, South Africa, and Paraguay. Although the cat has probably been domesticated quite as long as the dog, the number of distinct breeds inhabiting the same country, to which it has given rise, is strikingly small in comparison with those of the latter,—a fact owing, probably, to the nocturnal habits of the cat and the consequent difficulty in preventing indiscriminate crossing. That it is not owing to any inherent want of variability is proved by the very distinct breeds that have been developed in insular and other isolated situations, such as the tailless cats of the Isle of

Man, which differ in size of head and length of limbs, as well as in absence of tail from the ordinary form, and the domestic cats of the Malayan Archipelago, in which the tail is short and truncated. The best known and most distinct varieties are the Tabby; the Tortoise-shell or Spanish, with its pleasing mixture of black, white, and yellow; the Chartreuse, of a bluish-gray colour; and the Angora, with long silky hair of a dusky white, a favourite drawing-room pet, and the gentlest of all the varieties. Among less known breeds are the Chinese, with pendulous ears, the red-coloured breed of Tobolsk, and the twisted-tailed cats of Madagascar.

The disposition and habits of the domestic cat are familiar to all, and need not be dwelt upon here. It has never evinced that devotion to man which characterizes the dog, though many individual cases of feline attachment might be quoted. It becomes, however, strongly attached to particular localities, and will find its way back from the most distant places although conveyed thither under cover. How it performs such feats has long puzzled naturalists, and no theory that has yet been advanced seems adequately to meet the case. It has been contended recently by Mr A. R. Wallace that a cat which is being conveyed to a distance blindfold will have its sense of smell in full exercise, and will by this means take note of the successive odours it encounters on the way; that these will leave on its mind "a series of images as distinct as those we should receive by the sense of sight;" and that "the recurrence of these odours in their proper inverse order—every house, ditch, field, and village having its own well-marked individuality would make it an easy matter for the animal in question to follow the identical route back, however many turnings and cross roads it may have followed" (*Nature*, February 20, 1873).

Among the ancient Egyptians the cat was sacred to Isis or the moon; temples were raised, and sacrifices offered in its honour, and its body was embalmed at death. Nor is this feeling quite extinct among modern Egyptians, for in Cairo at the present time there is an endowment in operation for the lodging and feeding of homeless cats.

In the folk-lore of European nations the cat is regarded with suspicion as the favourite agent of witchcraft, and seems often to have shared in the cruelties inflicted on those who were supposed to practise the "black art." In Germany at the present day black cats are kept away from the cradles of children as omens of evil, while the appearance of a black cat on the bed of a sick person used to be taken as an announcement of approaching death.

C A T A C O M B S

CATACOMB, a subterranean excavation for the interment of the dead, or burial-vault. In this sense the word "Catacomb" has gained universal acceptance, and has found a place in most modern languages. The original term, *catacumba*, however, had no connection with sepulture, but was simply the name of a particular locality in the environs of Rome. It was derived from the Greek *κατα* and *κομμη*, "a hollow," and had reference to the natural configuration of the ground. In the district that bore this designation, lying close to the Appian Way, the basilica of St Sebastian was erected, and the extensive burial-vaults beneath that church—in which, according to tradition, the bodies of the apostles St Peter and St Paul rested for a year and seven months previous to their removal to the basilicas which bear their names—were, in very early times, called from it *cimiterium ad catacumbas*, or *catacumbas* alone. From the celebrity of this cemetery as an object of pilgrimage its name became extensively

known, and in entire forgetfulness of the origin of the word, *catacumbæ* came to be regarded as a generic appellation for all burial-places of the same kind. This extension of the term to Christian burial-vaults generally dates from the 9th century, and obtained gradual currency through the Christian world. The original designation of these places of sepulture is *crypta* or *cimiterium*.

The earliest Christian catacombs known may be assigned to the 2d century. The largest number belong to the 3d and the early part of the 4th. The custom of subterranean interment gradually died out, and entirely ceased with the sack of Rome by Alaric, 410 A.D. "The end of the catacomb graves," writes Mommsen (*Cent. Rev.*, May 1871), "is intimately connected with the end of the powerful city itself. . . . Poverty took the place of wealth, . . . the traditions of the Christian tomb-architects sank into utter insignificance, and the expanse of the wasted Campagna now offered room enough to bury the few bodies, without

having to descend as once far down below the surface of the earth." The earliest account of the Catacombs, that of St Jerome narrating his visits to them when a schoolboy at Rome, about 354 A.D. shows that interment in them was even then rare if it had not been altogether discontinued; and the poet Prudentius's description of the tomb of the Christian martyr Hippolytus, and the cemetery in which it stood, leads us to the same conclusion. With the latter part of the 4th century a new epoch in the history of the Catacombs arose,—that of religious reverence. In the time of Pope Damasus, 366–384 A.D., the Catacombs had begun to be regarded with special devotion, and had become the resort of large bands of pilgrims, for whose guidance catalogues of the chief burial-places and the holy men buried in them were drawn up. Some of these lists are still extant.¹ Pope Damasus himself displayed great zeal in adapting the Catacombs to their new purpose, restoring the works of art on the walls, and renewing the epitaphs over the graves of the martyrs. In this latter work he employed an engraver named Furius Philocalus, the exquisite beauty of whose characters enables the smallest fragment of his work to be recognized at a glance. This, in Dean Milman's happy words, "irreverent reverence, which converted the Catacombs from hidden and secret chambers, where piety might steal down to show its respect or affection for the dead, to, as it were, a great religious spectacle, the scene of devout pilgrimage to thousands" (Milman, *Essays*, p. 489), gave rise to extensive alterations in their construction and decoration, which has much lessened their value as authentic memorials of the religious art of the 2d and 3d centuries. Subsequent popes manifested equal ardour, with the same damaging results, in the repair and adornment of the Catacombs, and many of the paintings which cover their walls, which have been too unquestioningly assigned to the period of their original construction, are really the work of these later times. The Catacombs shared in the devastation of Rome by the Goths under Vitiges, in the 6th century and by the Lombards at a later period; and partly through the spoliation of these barbarian invaders, partly through the neglect of those who should have been their guardians, they sank into such a state of decay and pollution that, as the only means of preserving the holy remains they enshrined from further desecration, Pope Paul I., in the latter part of the 8th century, and Pope Paschal, at the commencement of the 9th, commenced the work of the translation of the relics, which was vigorously carried on by successive pontiffs until the crypts were almost entirely despoiled of their dead. The relics having been removed, the visits of pilgrims naturally ceased, and by degrees the very existence of those wonderful subterranean cemeteries was forgotten. Six centuries elapsed before the accidental discovery of a sepulchral chamber, by some labourers digging for *pozzolana* earth (May 31, 1578), revealed to the amazed inhabitants of Rome "the existence," to quote a contemporary record, "of other cities concealed beneath their own suburbs." Baronius, the ecclesiastical historian, was one of the first to visit the new discovery, and his "Annals" in more than one place evidence his just appreciation of its importance. The true "Columbus of this subterranean world," as he has been aptly designated, was the indefatigable Bosio, who devoted his life to the personal investigation of the Catacombs, the results of

which were given to the world in 1632 in a *hugo folio*, entitled *Roma Sotterranea*, profusely illustrated with rude but faithful plans and engravings. This was republished in a Latin translation with considerable alterations and omissions by Aringhi in 1651; and a century after its first appearance, the plates were reproduced by Bottari in 1737, and illustrated with great care and learning. Some additional discoveries were described by Boldetti in his *Osservazioni*, published in 1720; but, writing in the interests of the Roman Church with an apologetic not a scientific object, truth was made to bend to polemics, and little addition to our knowledge of the Catacombs is to be gained from his otherwise important work. The French historian of art, Seroux d'Agincourt, 1825, by his copious illustrations, greatly facilitated the study of the architecture of the Catacombs and the works of art contained in them. The works of Raoul Rochette display a comprehensive knowledge of the whole subject, extensive reading, and a thorough acquaintance with early Christian art so far as it could be gathered from books, but he was not an original investigator. The great pioneer in the path of independent research, which, with the intelligent use of documentary and historical evidence, has led in our own day to so vast an increase in our acquaintance with the Roman Catacombs, was the late Padre Marchi of the Society of Jesus. His work, *Monumenti delle arti Christiane Primitive*, so disastrously interrupted by the political vicissitudes of the times, is the first in which the strange misconception, received with unquestioning faith by earlier writers, that the Catacombs were exhausted sand-pits adapted by the Christians to the purpose of interment, was dispelled, and the true history of their formation demonstrated. Marchi's line of investigation was followed by the Commendatore De' Rossi, and his brother Michele, the former of whom was Marchi's fellow-labourer during the latter part of his explorations; and it is to them that we owe the most exhaustive scientific examination of the whole subject, in its geological, architectural, ritual, epigraphic, and artistic aspects, in the two volumes of *Roma Sotterranea*, published in 1864 and 1867, as well as in the articles periodically published in the *Bullettino di Archeologia Christiana*. A very convenient abridgment of De' Rossi's work has been produced in English under the same title by Dr Northcote, President of Oscott, and the Rev. W. R. Brownlow. The Catacombs of Rome are the most extensive with which we are acquainted, and, as might be expected in the centre of the Christian world, are in many respects the most remarkable. No others have been so thoroughly examined and illustrated. These may, therefore, be most appropriately selected for description as typical examples.

Our description of the Roman Catacombs cannot be more appropriately introduced than by St Jerome's account of his visits to them in his youth, already referred to, which, after the lapse of above fifteen centuries, presents a most accurate picture of these wonderful subterranean labyrinths. "When I was a boy," he writes, "receiving my education in Rome, I and my schoolfellows used, on Sundays, to make the circuit of the sepulchres of the apostles and martyrs. Many a time did we go down into the Catacombs. These are excavated deep in the earth, and contain, on either hand as you enter, the bodies of the dead buried in the wall. It is all so dark there that the language of the prophet (Ps. lv. 15) seems to be fulfilled, 'Let them go down quick into hell.' Only occasionally is light let in to mitigate the horror of the gloom, and then not so much through a window as through a hole. You take each step with caution, as, surrounded by deep night, you recall the words of Virgil—

"Horror ubique animos, simul ipsa silentia terrent."²

¹ The most important of these lists are the two Itineraries belonging to the first half of the 7th century, in the Salzburg library. One still earlier, but less complete, appears in the *Notitia Urbis Romae*, under the title *Index Cemeteriorum*. Another Itinerary, preserved at Einsiedeln, printed by Mabillon, dates from the latter half of the same century. That found in the works of William of Malmesbury (Hardy's ed. vol. ii. pp. 539–544) appears to be copied from it, or both may be from the same source. De' Rossi gives a comparative table of these Itineraries and other similar lists.

² Hieron., *Comment. in Ezech.*, lib. xx. c. 40. The translation is Dean Burgon's.

In complete agreement with Jerome's vivid picture the visitor to the Roman Catacombs finds himself in a vast labyrinth of narrow galleries, usually from 3 to 4 feet in width, interspersed with small chambers, excavated at successive levels, in the strata of volcanic rock subjacent to the city and its environs, constructed originally for the interment of the Christian dead. The galleries are not the way of access to the cemeteries, but are themselves the cemeteries,

the dead being buried in long low horizontal recesses, excavated in the vertical walls of the passages, rising tier above tier like the berths in a ship, from a few inches above the floor to the springing of the arched ceiling, to the number of five, six, or even sometimes twelve ranges. These galleries are not arranged on any definite plan, but, as will be seen from the woodcut (fig. 1), they intersect one another at different angles, producing an intricate net-

work which it is almost impossible to reduce to any system. They generally run in straight lines, and as a rule preserve the same level. The different stories of galleries lie one below the other (fig. 2) to the number of four or five (in one part of the cemetery of St Callistus they reach seven stories), and communicate with one another by stairs cut out of the living rock. Light and air are introduced by means of vertical shafts (*luminaria*) running up to the outer air, and often serving for several stories. The drawing (fig. 3) from Northcote gives a very correct idea of these galleries, with the tiers of graves pierced in the walls. The doorways which are seen interrupting the lines of graves are those of the family sepulchral chambers, or *cubicula*, of which we shall speak more particularly hereafter.

The graves, or *loculi*, as they are commonly designated, were, in the Christian cemeteries, with only a few exceptions (Padre Marchi produces some from the cemetery of St Cyriaca, *Monum. Primitiv.*, tav. xiv. xliii. xliv.), parallel with the length of the gallery. In the pagan cemeteries, on the other hand, the sepulchral recess as a rule entered the rock like an oven at right angles to the corridor, the

body being introduced endways. The plan adopted by the Christians saved labour, economized space, and consulted reverence in the deposition of the corpse. These *loculi* were usually constructed for a single body only. Some, however, were formed to contain two, three, or four, or even more corpses. Such recesses were known respectively as *bisomi*, *trisomi*, *quadrisomi*, &c., terms which often appear in the sepulchral inscriptions. After the introduction of the body the *loculi* were closed with the greatest care, either with slabs of marble the whole length of the aperture, or with huge tiles, three being generally employed, cemented together with great exactness, so as to prevent the escape of the products of decomposition (fig. 4). Where any epitaph was set up—an immense number are destitute of any inscription at all—it is always painted or engraved on these slabs or tiles. In the earlier interments the epitaph is simply daubed on the slab in red or black paint. In later examples it is incised in the marbles, the letters being rendered clearer by being coloured with vermilion. The enclosing slab very often bears one or more Christian symbols, such as the dove, the anchor, the olive-branch, or

the monogram of Christ (figs. 5, 6). The palm branch, which is also of frequent occurrence, has been solemnly decided by "the Congregation of Relics" to be an indisputable mark of the last resting place of a martyr. But the decision of this

FIG. 2.—Section of Galleries at different levels. From Seroux d'Agincourt.

infallible authority has been proved fallacious by the stern logic of facts,—the emblem being found in connection with epitaphs of persons dying natural deaths, or those prepared

FIG. 3.—View of a Gallery.

by persons in their lifetime, as well as in those of little children, and even of pagans. Another frequent concomitant of these Catacomb interments, a small glass vessel containing

FIG. 4.—Loculi. From De' Rossi.

traces of the sediment of a red fluid, embedded in the cement of the *loculus*, pronounced as confidently by the same authority to indicate a martyr's grave (fig. 7), has also shown the

unwisdom of pronouncing dogmatically without sufficient evidence. The red matter proves to be the remains of wine, not of blood; and the conclusion of the ablest archaeologists of the Church of Rome itself is that the vessels were placed

FIGS. 5 and 6.—Loculi. From De' Rossi.

where they are found, after the Eucharistic celebration or *agape* on the day of the funeral or its anniversary, and contained remains of the consecrated elements as a kind of

FIG. 7.—Glass Bottles. From Bosio.

religious charm. Instances of the pious theft, not altogether unknown in modern churches, which combines economy with becoming respect to the dead, appear in the Catacombs. Not a few of the slabs, it is discovered, have done double duty, bearing a pagan inscription on one side, and a Christian one on the other. These are known as *opisthographs*. The bodies were interred wrapt in linnen cloths, or swathed in bands, and were frequently preserved by embalming. In the case of poorer interments the destruction of the body was, on the contrary, often accelerated by the use of quicklime.

Interment in the wall-recess or *loculus*, though infinitely the most common, was not the only mode employed in the Catacombs. Other forms of very frequent recurrence are the *table-tomb* and *arched tomb*, or *arcosolium*. From the annexed woodcuts it will be seen that these only differ in the form of the surmounting recess. In each case the arched tomb was formed by an oblong chest, either hollowed out of the rock, or built of masonry, and closed with a horizontal slab. But in the table-tomb (fig. 8) the recess above, essential for the introduction of the corpse, is square, while in the *arcosolium* (fig. 9), a form of later date, it is semi-circular. Sarcophagi are also found in the Catacombs, but are of rare occurrence. They chiefly occur in the earlier cemeteries, and the costliness of their construction confined their use to the wealthiest classes,—e.g., in the cemetery of St Domitilla, herself a member of the imperial house. Another unfrequent mode of interment was in graves like those of modern times, dug in the floor of the galleries (Marchi, *u.s.*, tav. xxi. xxvi.). Table-tombs and *arcosolia*

are by no means rare in the corridors of the Catacombs, but they belong more generally to the *cubicula*, or family vaults, of which we now proceed to speak.

FIG. 8.—Table-Tomb.

These *cubicula* are small apartments, seldom more than 12 feet square, usually rectangular, though sometimes circular or polygonal, opening out of the main corridors. They are not unfrequently ranged regularly along the sides of the galleries, the doors of entrance, as may be seen in a previous illustration (fig. 3), following one another in as orderly succession as the bedchamber doors in the passage of a modern house. The roof is sometimes flat, but is more usually coved, and sometimes rises into a cupola. Both the roof and the walls are almost universally coated with stucco and covered with fresco paintings,—in the earlier works merely decorative, in the later always symbolical or historical. Each side of the cubiculum, except that of the entrance, usually contains a recessed tomb, either a table-tomb or arcosolium. That facing the entrance was the place of greatest honour, where in many instances the remains of a martyr were deposited, whose tomb, according to primitive usage, served as an altar for the celebration of the Eucharist. This was sometimes, as in the Papal crypt of St Callistus (fig. 10), protected from irreverence by lattice-work (*transennæ*) of marble. The cubiculum was originally designed for the reception of a very limited number of dead. But the natural desire to be buried near one's rela-

FIG. 9.—Arcosolia. From Bosio.

bones should be laid beside the bones of the man of God that came from Judah, is only the expression of an instinctive though unreasoning feeling, connecting greater

FIG. 10.—Restoration of the Papal Crypt, Cemetery of St Callistus. From De' Rossi.

personal safety with a resting-place close to the blessed dead, which awoke very early and acted very powerfully in the Christian Church. The Christian antiquary has cause continually to lament the destruction of works of art due to this craving. One of the most perfect examples of early Christian pictorial decoration, the so-called "Dispute with the Doctors," in the Catacomb of Callistus, the "antique style of beauty" of which is noticed by Kugler, has thus suffered irreparable mutilation, the whole of the lower part of the picture having been destroyed by the excavation of a fresh grave-recess (Bottari, vol. ii. tav. 15). The plates of De' Rossi, Perret, and, indeed, all illustrations of the Catacombs, exhibit frequent examples of the same destructive superstition. The woodcuts (figs. 11 and 12), taken from De' Rossi's great work, representing two of the *cubicula* in the cemetery of St Callistus, show the general arrangement of the loculi and the character of the frescos which ornament the walls and roof. These paintings, it will be seen, are simply decorative, of the same style as the wall-paintings of the baths, and those of Pompeii.

Each *cubiculum* was usually the burying-place of some one family, all the members of which were interred in it, just as in the chantry-chapels connected with mediæval churches. In them was celebrated the funeral-feast on the day of burial and on its anniversary, as well as the

tives caused new tombs to be cut in the walls, above and around and behind the original tombs, the walls being thus completely honey-combed with *loculi*, sometimes as many as seventy, utterly regardless of the paintings originally depicted on the walls. Another motive for multiplying the number of graves operated when the cubiculum contained the remains of any noted saint or martyr. The desire of the old prophet of Bethel that his

Eucharist, which was the invariable accompaniment of funerals in the primitive church (Bingham, *Orig. Eccl.*, bk. xxiii. c. iii. 12). The funeral banquet descended to the

FIG. 11.—Cubiculum in Cemetery of St Callistus. From De' Rossi.

Christian Church from pagan times, and was too often profaned by heathen licence. St Augustine, in several passages, inveighs against those who thus by "gluttony

FIG. 12.—Cubiculum in the Cemetery of St Callistus. From De' Rossi.

and insobriety buried themselves over the buried," and "made themselves drunk in the chapels of the martyrs, placing their excesses to the score of religious reverence for the dead" (August., *De Mor. Eccl. Cathol.*, c. 34; *Contr. Faust.*, lib. xx. c. 21; *Confess.*, lib. vi. c. 2). Some curious frescos representing these funeral feasts, found in the *cubicula* which were the scene of them, are reproduced by Bosio (pp. 355, 391) and others. A romantic air has been thrown over these burial chapels by the notion that they were the places of worship used by the Christians in times of persecution. This to a certain extent is doubtless true. Mr J. H. Parker, who has done more by his laborious and self-sacrificing investigations than any one living, not excepting De' Rossi himself, for the elucidation of the true history and archæology of the Catacombs, writes: "That during the time of persecution the bishops performed the divine offices in the Catacombs is not only recorded, but many of the chapels fitted up for that purpose remain, especially one in the chapel of St Priscilla, where

the altar or stone coffin of a martyr remains, with a small platform behind it for the priest or bishop to stand and officiate over it according to the practice of the early church" (*Archæology of Rome; The Catacombs*, § 3, p. 25). Mommsen also speaks of them unhesitatingly as "places of devotion for the community," adding, "this union of devotion with the interment, the development of the grave into the cemetery, of the cemetery into the church, is essentially Christian, one might perhaps say is Christianity" (*u.s.*, p. 166). But that they can have been so used to any large extent is rendered impossible by the limited dimensions of these apartments, none of which could hold more than fifty or sixty persons. In some of the Catacombs, however, there are larger halls and connected suites of chapels, which may possibly have been constructed for the purpose of congregational worship during the dark periods when the public exercise of their religion was made penal. The most remarkable of these is in the cemetery of St Agnes (see annexed plan, fig. 13). It consists of five

FIG. 13.—Plan of a supposed Church, Catacombs of St Agnes. From Marchi.

rectangular compartments, three on one side of the corridor and two on the other, connected by a passage intersecting the gallery at right angles. Two of the five compartments are supposed to have been assigned to male, and two to female worshippers, the fifth, at the extremity of the whole, being reserved for the altar and its ministers. In the centre of the end-wall stands a stone chair (fig. 14), considered to have been the Episcopal cathedra, with a bench for the clergy on each side. There is no trace of an altar, which may, Padre Marchi thinks, have been portable. The walls of the compartments are occupied by arched sepulchral recesses, above and below which are tiers of ordinary graves or *loculi*. The arrangements are certainly such as indicate a congregational purpose, but the extreme narrowness of the suite, and still more of the passage which connects the two divisions, must have rendered it difficult for any but a small number to take any intelligent part in the services at the same time. Although the idea of the use of the Catacombs for religious worship may have been pressed too far, there can be no doubt that the sacred rites of the church were celebrated within them. We have already spoken of the Eucharistic celebrations of which the *cubicula* were the scene; and still existing baptisteries prove that the other sacrament was also administered there. The most remarkable of these baptisteries is that in the Catacomb of St Pontianus (fig. 15). Ten steps lead down to a basin of sufficient depth for immersion, supplied by a spring. The wall at the back exhibits a fresco of a jewelled cross, beneath an arched recess, above which is a fresco of the Baptism of our Lord. Some of the subter-

FIG. 14.—Bishop's Chair. Catacomb of St Agnes.

anean chambers contain armed seats and benches cut out of the tufa rock. These are supposed by Marchi and others to indicate school-rooms, where the catechumens were instructed by the bishop or presbyters. But this theory

FIG. 15.—Baptistery of St Pontianus. From Perret.

wants verification. It is impossible not to be struck with the remarkable analogy between these rock-hewn chairs and those discovered in the Etruscan tombs (*vide infra*), of the purpose of which no satisfactory explanation has been given.

Very exaggerated statements have been made as to the employment of the Catacombs as dwelling-places by the Christians in times of persecution. We have, however, sufficient evidence that they were used as places of refuge from the fury of the heathen, in which the believers—especially the bishops and clergy, who would naturally be the first objects of attack—might secrete themselves until the storm had blown over. This was a purpose for which they were admirably adapted both by the intricacy of their labyrinthine passages, in which any one not possessing the clue would be inevitably lost, and the numerous small chambers and hiding places at different levels which might be passed unperceived in the dark by the pursuers. As a rule also the Catacombs had more than one entrance, and frequently communicated with an *arenaria* or sand-quarry; so that while one entrance was carefully watched, the pursued might escape in a totally different direction by another. But to quote again Mr J. H. Parker, “the Catacombs were never intended, nor fit for, dwelling-places, and the stories of persons living in them for months are probably fabulous. According to modern physicians it is impossible to live many days in the caves of *pozzolana* in which many of the Catacombs are excavated.” Equally exaggerated are the statements as to the linear and lateral extent of the Catacombs, and their intercommunication with one another. Without resorting to this exaggeration, Mommsen can speak with perfect truth of the “enormous space occupied by the burial vaults of Christian Rome, not

surpassed even by the *cloacæ* or sewers of Republican Rome,” but the data are too vague to warrant any attempt to define their dimensions. Padre Marchi has estimated the united length of the galleries at from 800 to 900 miles, and the number of interments at between 6,000,000 and 7,000,000; Martigny's estimate is 587 miles; and Northcote's, lower still, at “not less than 350 miles.” The idea of general intercommunication is negatived by the fact that the chief cemeteries are separated by low-ground or valleys, where any subterranean galleries would be at once filled with water.

It now remains for us to speak of the history of these subterranean burial places, together with the reasons for, and mode of, their construction. From the period of the rediscovery of the Catacombs, towards the end of the 16th century, almost to our own day, a gigantic fallacy prevailed, repeated by writer after writer, identifying the Christian burial-places with disused sand-pits. It was accepted as an unquestionable fact by every one who undertook to describe the Catacombs, that the Christians of Rome, finding in the labyrinthine mazes of the exhausted *arenariæ*, which abounded in the environs of the city, whence the sand used in building had been extracted, a suitable place for the interment of their martyred brethren, where also the sacred rites accompanying the interment might be celebrated without fear of interruption, took possession of them and used them as cemeteries. It only needed a comparison of the theory with the visible facts to refute it at once. But the search after truth is troublesome, and to controvert received doctrines is always unpopular, and it was found easier to accept the traditional view than to investigate for one's self, and so nearly three centuries elapsed before the independence of the *arenariæ* and the Catacombs was established. The discovery of this independence is due to Padre Marchi, whose name has been already so often mentioned. Starting with the firmest belief in the old traditional view, his own researches by degrees opened his eyes to its utter baselessness, and led him to the truth, now universally recognized by men of learning, that the Catacombs were exclusively the work of the Christians, and were constructed for the purpose with which their name is universally connected—the interment of the dead. It is true that a catacomb is often connected with the earlier sand-quarry, and starts from it as a commencement, but the two are excavated in different strata, suitable to their respective purposes, and their plan and construction are so completely unlike as to render any confusion between them impossible.

The igneous formation of which the greater part of the Roman Campagna is, in its superior portion, composed, contains three strata known under the common name of *tufa*,—the “stony,” “granular,” and “sandy” *tufa*,—the last being commonly known as *pozzolana*.¹ The *pozzolana* is the material required for building purposes, for admixture with mortar; and the sandpits are naturally excavated in the stratum which supplies it. The stony *tufa* (*tufa litoide*) is quarried as building-stone. The granular *tufa* is useless for either purpose, containing too much earth to be employed in making mortar, and being far too soft to be used as stone for building. Yet it is in this stratum, and in this alone, that the Catacombs are constructed; their engineers avoiding with equal care the solid stone of the *tufa litoide* and the friable *pozzolana*, and selecting the strata of medium hardness, which enabled them to form the vertical walls of their galleries, and to excavate the *loculi* and *cubicula* without severe labour, and also without fear of their falling in.

¹ In Rome the three strata are known to geologists as *tufa litoide*, *tufa granulare*, and *pozzolana*.

The annexed woodcut (fig. 16) from Marehi's work, when compared with that of the Catacomb of St Agnes already given, presents to the eye the contrast between the wide winding irregular passages of the sand-pit, calculated for

FIG. 16.—Arenaria beneath the Cemetery of Callistus.

the admission of a horse and cart, and the narrow reutilized near accurately-defined galleries of the Catacomb. The distinction between the two is also plainly exhibited when for some local or private reasons an ancient *arenaria* has been transformed into a cemetery. The modifications required to strengthen the crumbling walls to support the roof and to facilitate the excavation of *loculi*, involved so much labour that, as a rule, after a few attempts, the idea of utilizing an old quarry for burial purposes was abandoned.

Another equally erroneous idea has only slowly retired before the increased historical research and scientific investigation which have been brought to bear on the construction of the Catacombs. This is, that these vast burial-places of the early Christians remained entirely concealed from the eyes of their pagan neighbours, and were constructed not only without the permission of the municipal authorities but without their cognizance. Nothing can be further from the truth. Such an idea is justly stigmatized by Mommsen as ridiculous, and reflecting a discredit as unfounded as it is unjust on the imperial police of the capital. That such vast excavations should have been made without attracting attention, and that such an immense number of corpses could have been carried to burial in perfect secrecy is utterly impossible. Nor was there any reason why secrecy should have been desired. The decent burial of the dead was a matter especially provided for by the Roman laws. No particular mode was prescribed. Interment was just as legal as cremation, and had, in fact, been universally practised by the Romans until the later days of the republic.¹ The bodies of the Scipios and Nases were buried in still existing catacombs; and if motives of reverence for that which had been the temple of the Holy Ghost led the Christians to adopt that which Minucius Felix calls "the better, and more ancient custom of inhumation" (*Octavius*, c. 2), there was absolutely nothing, to quote the words of Dr Northcote (*Roma Subterranea*, pp. 56, 61), "either in their social or religious position to interfere with their freedom of action. The law left them entire liberty, . . . and the faithful did but use their liberty in the way that suited them best, burying their dead according to a fashion to which many of them had been long accustomed, and which enabled them at the same time to follow in death the example of him who was also their model in life." Interment in rock-hewn tombs, "as the manner of the Jews is to bury," had been practised in Rome by the Jewish settlers for a considerable period anterior to the rise of the Christian Church. A

Jewish catacomb, now lost, was discovered and described by Bosio (*Rom. Sott.*, p. 141), and others are still accessible. They are only to be distinguished from Christian catacombs by the character of their decorations, the absence of Christian symbols, and the language of their inscriptions. There would, therefore, be nothing extraordinary, or calling for notice in the fact that a community, always identified in the popular heathen mind with the Jewish faith, should adopt the mode of interment belonging to that religion. Nor have we the slightest trace of any official interference with Christian burials, such as would render secrecy necessary or desirable. Their funerals were as much under the protection of the law, which not only invested the tomb itself with a sacred character, but included in its protection the area in which it stood, and the *cella memoriae* or chapel connected with it, as those of their heathen fellow-citizens, while the same shield would be thrown over the burial-places, which, as we learn from Tertullian (*Apolog.*, c. 39), were common among the early Christians, as over those existing among the heathen population of Rome. We may then completely dismiss the notion of there being any studied secrecy in connection with the early Christian cemeteries, and proceed to inquire into the mode of their formation. The investigations of De' Rossi, confirmed by the independent researches of Mr J. H. Parker, show that, almost without exception, they had their origin in small burial areas, the property of private persons or of families, gradually spreading and ramifying and receiving additions of one subterranean story after another as each was required for interments. The first step would be the acquisition of a plot of ground either by gift or purchase for the formation of a tomb. Christians were not beyond the pale of the law, and their faith presented no hindrance to the property being secured to them in perpetuity. To adapt the ground for its purpose as a cemetery, a gallery was run all round the area in the tufa rock at a convenient depth below the surface, reached by staircases at the corners. In the upright walls of these galleries *loculi* were cut as needed to receive the dead. When these first four galleries were full others were mined on the same level at right angles to them, thus gradually converting the whole area into a net-work of corridors. If a family vault was required, or a burial chapel for a martyr or person of distinction, a small square room was excavated by the side of the gallery and communicating with it. When the original area had been mined in this way as far as was consistent with stability, a second story of galleries was begun at a lower level, reached by a new staircase. This was succeeded by a third, or a fourth, and sometimes even by a fifth. When adjacent burial areas belonged to members of the same Christian confraternity, or by gift or purchase fell into the same hands, communications were opened between the respective cemeteries, which thus spread laterally, and gradually acquired that enormous extent which, "even when their fabulous dimensions are reduced to their right measure, form an immense work."² This could only be executed by a large and powerful Christian community unimpeded by legal enactments or police regulations, "a living witness of its immense development corresponding to the importance of the capital." But although, as we have said, in ordinary times there was no necessity for secrecy, yet when the peace of the church was broken by the fierce and often protracted persecutions of the heathen emperors, it became essential to

¹ Cicero is our authority for the burial of Marius, and for Sulla's being the first member of the Gens Cornelia whose dead body was burnt.—*De Legg.*, ii. 22.

² Mommsen's chosen example of an ancient burial-chamber, extending itself into a catacomb, or gathering subterranean additions round it till a catacomb was established, is that of the Cemetery of St Domitilla, traditionally identified with a granddaughter of Vespasian, and the catacomb of SS. Nereus and Achilleus on the Appian and Ardeatine way.

adopt precautions to conceal the entrance to the cemeteries, which became the temporary hiding-places of the Christian fugitives, and to baffle the search of their pursuers. To these stormy periods we may safely assign the alterations which may be traced in the staircases, which are sometimes abruptly cut off, leaving a gap requiring a ladder, and the formation of secret passages communicating with the *arenarice*, and through them with the open country.

When the storms of persecution ceased and Christianity had become the imperial faith, the evil fruits of prosperity were not slow to appear. Cemetery interment became a regular trade in the hands of the *fossores*, or grave-diggers, who appear to have established a kind of property in the Catacombs, and whose greed of gain led to that destruction of the religious paintings with which the walls were decorated, for the quarrying of fresh *loculi*, to which we have already alluded. Monumental epitaphs record the purchase of a grave from the *fossores*, in many cases during the life time of the individual, not unfrequently stating the price. A very curious fresco, found in the cemetery of Callistus, preserved by the engravings of the earlier investigators (Bottari, tom. ii. p. 126, tav. 99), represents a "fossor" with his lamp in his hand and his pick over his shoulder, and his tools lying about him. Above is the inscription, "Diogenes Fossor in Pace depositus."

Our space forbids us to enter on any detailed description of the frescos which cover the walls and ceilings of the burial-chapels in the richest abundance. It must suffice to say that the earliest examples are only to be distinguished from the mural decorations employed by their pagan contemporaries (as seen at Pompeii and elsewhere) by the absence of all that was immoral or idolatrous, and that it was only very slowly and timidly that any distinctly religious representations were introduced. These were at first purely symbolical, meaningless to any but a Christian eye, such as the Vine, the Good Shepherd, the Sheep, the Fisherman, the Fish, &c. Even the personages of ancient mythology were pressed into the service of early

triumphing over the allurements of sensual pleasure. The person of Christ appeared but rarely, and then commonly simply as the chief personage in an historical picture. The events depicted from our Lord's life are but few, and always conform rigidly to the same traditional type. The most frequent are the miracle at Cana, the multiplication of the loaves and fishes, the paralytic carrying his bed, the healing of the woman with the issue of blood, the raising of Lazarus, Zaccarius, and the triumphal entry into Jerusalem. The Crucifixion, and subjects from the Passion, are never represented. The cycle of Old Testament subjects is equally limited. The most common are the history of Jonah as a type of the Resurrection, the Fall, Noah receiving the dove with the olive branch, Abraham's sacrifice of Isaac, Moses taking off his shoes, David with

the sling, Daniel in the lions' den, and the Three Children in the fiery furnace. The mode of representation is always conventional, the treatment of the subject no less than its choice being dictated by an authority to which the artist was compelled to bow. Whatever be the date of the original pictures, a point on which considerable doubt exists, it is tolerably certain that the existing frescos are restorations of the 8th or even a later century, from which the character of the earlier work can only very imperfectly be discovered. All the more valuable of these paintings have been reproduced in Mr Parker's magnificent series of photographs taken in the Catacombs by the magnesium light. The contrast between these rude inartistic performances and the finished drawings, which profess to be accurate copies, in Perret's costly work, fully warrants the late Dean Milman's severe strictures on that "beautiful book,"—"so beautiful as to be utterly worthless to the archaeologist and historian, which wants only two things,—truth and fidelity." Not the frescos alone, but also every point of interest in the plan, structure, and decoration of the Catacombs has been illustrated by Mr Parker in the same series of photographs, an examination of which is almost as instructive as a personal visit to the Catacombs themselves.¹

Beyond Rome and its suburbs the most remarkable Christian Catacombs are those in the vicinity of Naples, described by Pelliccia (*De Christ. Eccl. Polit.*, vol. iv. Dissert. 5), and in a separate treatise by Bellerman. Plans of them are also given by Agincourt in his great work on Christian Art. These catacombs differ materially from those of Rome. They were certainly originally stone-quarries, and the hardness of the rock has made the construction practicable of wide, lofty corridors, and spacious halls, very unlike the narrow galleries and contracted chambers in the Roman cemeteries. The mode of interment, however, is the same as that practised in Rome, and the *loculi* and *arcosolia* differ but little in the two. The walls and ceilings are covered with fresco paintings of different dates, in some cases lying one over the other. This catacomb contains an unquestionable example of a church, divided into a nave and chancel, with a rude stone altar and bishop's seat behind it. At Syracuse also there are very extensive catacombs known as "the Grottos of St John." They are also figured by Agincourt, and described by Denon (*Voyage en Sicile et Malte*). Denon considers them of pagan origin, and to have passed to the Christians. He speaks of an entire underground city with several stories of larger and smaller streets, squares, and cross ways, cut out of the rock; at the intersection of the crossways, are immense circular halls of a bottle shape, like a glass-house furnace, lighted by air shafts. The galleries are generally very narrow, furnished on each side with arched tombs, and communicating with family sepulchral-chambers closed originally by locked doors, the

FIG. 19.—Plan of the Catacombs of St John, Syracuse.

marks of the hinges and staples being still visible. The walls are in many places coated with stucco adorned with frescos, including palms, doves, labara, and other Christian symbols. A more complete examination of this interesting cemetery is much needed. The ground-plans (figs. 19, 20), from Agincourt, of the catacomb and of one of the circular halls, show how widely it differs in arrangement from the Roman catacombs. The frequency of blind passages and of circular chambers will be noticed, as well as the very large number of bodies in the cruciform recesses, apparently amounting in one instance to nineteen. Agincourt remarks that this cemetery "gives an idea of a work executed with design

FIG. 20.—Plan of Circular Hall, Catacombs of St John, Syracuse. From Agincourt.

and leisure, and with means very different from those at command in producing the Catacombs of Rome."

Denon also describes catacombs at Malta near the ancient capital of the island. The passages were all cut in a close-grained stone, and are very narrow, with arched ceilings, running very irregularly, and ramifying in all directions. The greater part of the tombs stand on either side of the galleries in square recesses (like the table-tombs of the Roman Catacombs), and are rudely fashioned to imitate sarcophagi. The interments are not nearly so numerous as in other catacombs, nor are there any vestiges of painting, sculpture, or inscriptions. At Taormina in Sicily is a Saracenic catacomb, also figured by Agincourt. The main corridor is 12 feet wide, having three or more ranges of *loculi* on either side, running longitudinally into the rock, each originally closed by a stone, bearing an inscription.

Passing to Egypt, a small Christian catacomb has been recently discovered at Alexandria, and described and figured by De' Rossi.¹ The *loculi* here also are set endways to the passage. The walls are abundantly decorated with paintings, one of a liturgical character. But the most extensive catacombs at Alexandria are those of Ægypto-Greek origin, from the largest of which, according to Strabo (lib. xvii. p. 795), the quarter where it is placed had the name of the Necropolis. The plan, it will be seen, is remarkable for its regularity (figs. 21, 22). Here, too, the graves run endways into the rock. Other catacombs in the vicinity of the same city are described by Pocock and other travellers, and are figured by Agincourt.

FIG. 21.—Plan of Catacomb at Alexandria. From Agincourt.

FIG. 22.—Section of a Gallery in Catacomb at Alexandria. From Agincourt.

Subterranean cemeteries of the general character of those described are very frequent in all Southern and Eastern countries. A vast necropolis in the environs of Saida, the ancient Sidon, is described in Renan's *Mission en Phénicie*, and figured in Thobois's plates. It consists of a series of apartments approached by staircases, the sides pierced with sepulchral recesses running lengthwise into the rock.

The rock-hewn tombs of Etruria scarcely come under the category of catacombs, in the usual sense, being rather independent family burial-places, grouped together in a necropolis. They are, however, far too remarkable to be altogether passed over. These sepulchres are usually hollowed out of the face of low cliffs on the side of a hill. They sometimes rise tier above tier, and are sometimes all on the same level "facing each other as in streets, and branching off laterally into smaller lanes or alleys;" and occasionally forming "a spacious square or piazza sur-

¹ *Bulletino di Archeologia Christiana*, November 1864, August 1865.

rounded by tombs instead of houses" (Dennis, *Cities and Cemeteries of Etruria*, vol. ii. p. 31). The construction of the tombs commonly keeps up the same analogy between the cities of the living and those of the dead. Their plan is for the most part that of a house, with a door of entrance and passage leading into a central chamber or *atrium*, with others of smaller size opening from it, each having a stone-hewn bench or *triclinium* on three of its sides, on which the dead, frequently a pair of corpses side by side, were laid as if at a banquet. These benches are often hewn in the form of couches with pillows at one end, and the legs carved in relief. The ceilings have the representation of beams and rafters cut in the rock. In some instances arm-chairs, carved out of the living rock, stand between the doors of the chambers, and the walls above are decorated with the semblance of suspended shields. The walls are often covered with paintings in a very simple archaic style, in red and black. As a typical example of the Etruscan tombs we give the plan and section (figs. 23, 24) of the *Grotta della Selva* at Cervetri from

FIG. 23.—Plan of a Tomb at Cervetri. From Dennis.

Dennis (pp. 32, 35). The tombs in some instances form subterranean groups more analogous to the general idea of a catacomb. Of this nature is the very remarkable cemetery

FIG. 24.—Section of the Tomb of the Seats and Shields, Cervetri. From Dennis.

at Poggio Gajella, near Chiusi, the ancient Clusium, of a portion of the principal story of which the woodcut (fig. 25) is a plan. The most remarkable of these sepulchral chambers is a large circular hall about 25 feet in diameter,

supported by a huge cylindrical pillar hewn from the rock. Opening out of this and the other chambers, and connecting them together, are a series of low winding passages or

FIG. 25.—Plan of a portion of the principal story in the Poggio Gajella. From Dennis.

cuniculi, just large enough for a man to creep through on all fours. No plausible suggestion has been offered as to the purpose of these mysterious burrows, which cannot fail to remind us of the labyrinth which, according to Varro's description as quoted by Pliny (*Hist. Nat.*, lib. xxxvi. c. 19, § 4), was the distinguishing mark of Porsena's tomb, and which have led some adventurous archaeologists to identify this sepulchre with that of the great king of Etruria (Dennis, *u.s.*, p. 393. 7).

CATALEPSY (from *κατάληψις*, a seizure) is a term applied to a nervous affection characterized by the sudden suspension of sensation and volition, accompanied with a peculiar rigidity of the whole or of certain muscles of the body. The subjects of catalepsy are in most instances females of highly nervous temperament. The exciting cause of an attack is usually mental emotion operating either suddenly, as in the case of a fright, or more gradually in the way of prolonged depression. The symptoms presented vary in different cases, and even in the same individual in different attacks. Sometimes the typical features of the disease are exhibited in a state of complete insensibility, together with a statue-like appear-

ance of the body which will retain any attitude it may be made to assume during the continuance of the attack. In this condition the whole organic and vital functions appear to be reduced to the lowest possible limit consistent with life, and to such a degree as to simulate actual death. At other times considerable mental excitement will accompany the cataleptic symptoms, and the patient will sing or utter passionate exclamations during the fit, being all the while quite unconscious. The attack may be of short duration, passing off within a few minutes. It may, however, last for many hours, and in some rare instances persist for several days; and it is conceivable that in such cases the appearances presented might be mistaken for real death.

as is alleged to have occasionally happened. Catalepsy belongs to the class of functional nervous disorders, of which the pathology is but little understood, owing to the manner in which morbid physical and psychical conditions are mixed up. Although it is said to occur in persons in perfect health, careful inquiry will usually reveal some departure from the normal state, as is shown by the greater number of the recorded cases. More particularly is this true of females, in whom some form of menstrual derangement will generally be found to have preceded the cataleptic affection. Catalepsy is sometimes associated with epilepsy and with grave forms of mental disease. In ordinary cases, however, the mental phenomena bear close resemblance to those witnessed in hysteria, with which disease catalepsy, though not identical, has very close alliance. In many of the subjects of catalepsy there appears to be a remarkable weakness of the will, whereby the tendency to lapse into the cataleptic state is not resisted but rather in some measure encouraged, and attacks may thus be induced by the most trivial circumstances. From what has been stated it follows that the successful treatment of such a disease as catalepsy must depend upon the due recognition of both its corporeal and mental relations. While the state of health will demand the attention of the physician, his skill and judgment will be no less urgently called for in dealing with the mental and moral characteristics manifested in each particular case. Dr Chambers has shown that efforts directed to obtain command of the patient's will, so as to compel her to resist to the utmost the inclination to fall into the cataleptic state, may succeed in curing even aggravated examples of this disease. See ECSTASY, HYSTERIA, SOMNAMBULISM.

CATALONIA (in Spanish, *Cataluña*), an old province of Spain and principality of the crown of Aragon, triangular in shape, and forming the north-east corner of the peninsula, lies between $40^{\circ} 30'$ and $42^{\circ} 51'$ N. lat., and $0^{\circ} 15'$ and $3^{\circ} 21'$ E. long., and is bounded on the N. by the Pyrenees, W. by Aragon, S. by Valencia, E. by the Mediterranean. The greatest breadth is 130 miles, the greatest length 185 miles; area, 12,483 square miles. The coast, which is partly sandy, partly rocky, extends about 240 miles; the harbours are mostly unprotected from the wind. The surface is much broken by spurs of the Pyrenees, the direction of which is generally south. Running south-west to north-east, and united on the north with one of the offsets of the Pyrenees, is the range of the Sierra Llena, which bisects the province, and forms its central watershed. The principal rivers are the Ter, the Llobregat, and the Ebro, which all run into the Mediterranean. None of them is navigable. The climate, in spite of frequent mists and rains, sudden changes of temperature, and occasional great mid-day heat, is healthy and favourable to vegetation. The soil is light and loamy. Amongst the rocks of the province may be mentioned granite, eliasolite schists, porphyry and lava. Near Olot, towards the north-east, is a district containing extinct volcanoes. Oolitic limestone is found in the neighbourhood of Figueras; and in other localities, nummulitic and Miocene deposits are represented. Mining is not much prosecuted; but copper, zinc, manganese, marble, sulphur, and coal are worked, and rock salt in abundance is procured from Cardona. The vegetation of Catalonia varies according to the altitude and nature of different regions. The dwarf-palm, orange, lime, and olive grow in the warmer tracts; and on the higher grounds the thorn-apple, pomegranate, myrtle, esparto, and heaths flourish. There is much woodland, but meadows and pastures are rare. Maize, millet, rye, flax, liquorice, and fruits of all sorts—especially nuts, almonds, oranges, figs, walnuts, and chestnuts—are produced. Wheat

sufficient for one-fourth of the population is grown, and the vine is extensively cultivated. Few cattle, but numbers of sheep, goats, and swine are reared. Game is plentiful, and the fisheries on the coast are excellent. The exports are chiefly fruits, cork, and wines. The wines are for the most part rough and strong, though some are very good, especially when matured. They are much used to adulterate those of Oporto, or, after undergoing the operation termed *compage*, are passed off as Bordeaux wines in France. The best of them, "*priorato*," is chiefly known in England under the disguise of second or third-rate port; it was much used in the military hospitals of America during the Civil War. The imports are chiefly textiles, coal, coke, machinery of all kinds, and salt-fish. The value of imports in 1870 was £5,996,143; of the exports, £2,884,306; the loss of the balance of £3,111,837 against Catalonia being partly borne by the other provinces of Spain, and to a great extent paid in wines, fruits, and corks. The value of exports to the Spanish American colonies in 1873 exceeded £2,220,000. The manufactures of Catalonia are cotton, silk, woollen goods, brandy, paper, cordage, and firearms. The Catalonians are a frugal, sharp-witted, and industrious people, having much national pride, and a strong revolutionary spirit. They are distinct in origin from the other inhabitants of Spain, from whom they differ both in their dialect and costume and in their great energy and their love of enterprise. Irrigation, careful husbandry, and railroad communication have much developed the resources of their country, in themselves excellent; and there are many manufacturing towns and industrial establishments. Catalonia is divided into the provinces Gerona, Barcelona, Tarragona, and Lerida. Its chief towns are the ports of Rosas, Mataro, Tarragona, and the capital Barcelona; and Tortosa, Gerona, Figueras, Lerida, and Manresa. The population, in 1867, was 1,744,520.

Catalonia was one of the first of the Roman possessions in Spain, and formed the north-eastern portion of *Hispania Tarraconensis*. About 470 it was occupied by the Alans and Goths, and thus came to be called *Gothallonia*, whence the modern name of the province. It was taken possession of by the Berbers in 712, who were in turn dispossessed by the Spaniards and the troops of Charlemagne in 788, and was after that ruled by French counts, who soon, however, made themselves independent of France. By the marriage of Count Raymond Berenger of Barcelona with Petronilla of Aragon, in 1137, Catalonia became annexed to the latter province; but this union was frequently severed. In 1610, when Philip IV. attempted to deprive Catalonia of its rights and privileges, it gave itself up to Louis XIII. of France. It was restored to Spain in 1659, and was once more occupied by the French from 1694 to 1697. Under Philip V. Catalonia, in 1714, was deprived of its Cortes and liberties. From 1808 to 1813 it was held by France. It was the scene of civil war in 1823, and of important revolutionary operations in the Carlist war.

CATAMARCA, or, in its full form, SAN FERNANDO DE CATAMARCA, the capital of the province of the same name in the Argentine Republic, is situated in $28^{\circ} 20'$ S. lat. and $66^{\circ} 25'$ W. long. It is pretty regularly built, has a large square, with an obelisk in memory of the achievement of national independence, and numbers among its public buildings a small townhouse, a fort, a Franciscan monastery, and a Santa Teresa convent. The old establishment of the Mercedarios, for some time possessed by the Jesuits, now serves as a high school. The import trade, even of European goods, is considerable, as the town is a centre of distribution for an extensive and flourishing district. Dried figs, wine, brandy, and cotton are the principal articles of export; the copper, for which the province is so well known, is from another district. The present town of Catamarca only dates from 1685, when it replaced the old town of Chaera, the ruins of which are still to be seen a short distance to the north, at a spot which was found both unhealthy and exposed to inundation. Chacra had shortly before, in 1679, been appointed capital instead

of San Juan de Loundres, which had been founded in 1558. Population about 6000.

CATANIA, the ancient *Catana*, a city and seaport of Sicily and the chief town of a province, is situated on the east coast of the island, at the foot of the southern projections of Mount Etna, about 60 miles by rail from Messina, in $37^{\circ} 28' 20''$ N. lat. and $15^{\circ} 5' 15''$ E. long. It is one of the most important and attractive cities in the island, and has a fine appearance from the sea. Its streets are wide, regular, and finely paved with blocks of lava; and not only its public buildings but a large number of its private mansions are spacious and handsome structures of lava and limestone ornamented with marble. Among its churches, which number upwards of a hundred, the first place is held by the cathedral, originally founded by Roger I. in 1091, but for the most part rebuilt since the earthquake of 1693; and, at the head of its monastic institutions stands the great Benedictine abbey of San Nicolo, which occupies an area of about 21 acres, and has hardly more than two or three buildings of the same kind in Europe to be compared with it. Its first foundation dates from 1518, when the Benedictines removed from the town of Nicolosi further up the slope of Mount Etna, where they had been settled since 1359; but the present buildings were erected in the beginning of the 18th century by Contini of Rome. The church is principally remarkable for a grand organ, with seventy-two stops and 2916 pipes, built by Donato del Piano in 1760. The chief educational institution is the university founded in 1445 by Alphonso of Aragon; it has five faculties and thirty-eight professors, and was attended in 1873 by 233 students. The library is of considerable extent; but its collections of antiquities are surpassed by those in the Biscari Museum, founded by Prince Ignazio Biscari in the end of the 18th century. The senate house, the theatre, and the hospitals are the most important of the other buildings; and among the associations may be mentioned an academy of sciences and a college of the fine arts. Remains of the Roman period are numerous and extensive; they include a theatre, an amphitheatre, an odeum, several baths known as the Bagni Achillei, a number of tombs to the north-west of the town, and a few fragments of a so-called temple of Ceres. The theatre is for the most part buried under the *débris* of volcanic disturbances; and it has at different times served as a quarry for more modern buildings. Catania is the seat of a bishop, a prefect, and a court of appeal, as well as the residence of the grand prior of the Order of Malta. It is a place of great wealth, and is remarkable for the display of its festivals, of which the most important is held in August in honour of Santa Agata, the patroness of the city. Its industry and commerce are of considerable importance; silk and linen are largely manufactured, and there is a regular export of sulphur, grain, fruits, macaroni, olives, and articles in amber and lava. In 1873 the sulphur shipped amounted to 57,383 tons. In 1871 there entered the port 2297 sailing and 434 steam ships, with a respective tonnage of 97,442 and 162,387 tons. The value of the exports to Great Britain in 1874 was £160,000. The harbour is small, and accessible only to comparatively small craft, but another is in course of construction, which will be capable of receiving vessels of the largest size. Population in 1871, 84,379.

The ancient Catana was founded (730 B.C.) by a colony from the neighbouring city of Naxos, which was itself founded by the Chalcidians of Eubœa. It maintained its independence till 476 B.C., when it was taken by Hiero I., who removed its inhabitants to Leontini, and repopled the city with a new colony of 5000 Syracusans and an equal number of Peloponnesians, at the same time changing its name to Etna. Soon after the death of Hiero the former inhabitants obtained possession of the town, when it again took the name of Catana. In 403 B.C. it was taken by Dionysius of Syracuse, who, after plundering the city and selling the inhabi-

itants for slaves, established there a body of Campanian mercenaries. In the first Punic war it was one of the earliest among the cities of Sicily to submit to the Romans, and it appears to have afterwards continued on friendly terms with them. In the time of Cicero it was a flourishing and wealthy city; but it suffered so severely from the ravages of Sextus Pompeius, that Augustus afterwards sent a colony of veterans thither. In its more modern history the principal events are its occupation by the Goths, its deliverance by Belisarius, its sack by the Saracens, its conquest by the Normans, its destruction by earthquake in 1169, and its devastation by Henry VI., the erection of its fortress of Rocca Orsina by Frederick II., and several sieges in the course of the 15th century, the partial ruin of its harbour in 1669 by the eruption of Mount Etna, and its almost total overthrow by the earthquake of 1693.

CATANZARO, a city of Italy, capital of the province of Calabria Ulteriore II., stands on the slope of a lofty and rocky hill near the Gulf of Squillace, 30 miles S.S.E. of Cosenza. It is the seat of a bishopric, and has a cathedral, several churches and convents, a castle, built by Robert Guiscard, a royal academy of sciences, a diocesan school, a college, a theatre, a foundling and two other hospitals, and other charitable institutions. It has manufactures of silk, velvet, and woollen goods, and a considerable trade in corn and wine and walnut oil. The most important fact in its history is the successful defence it made in the 16th century against the French general Lantree. In 1783 many of its principal buildings were destroyed by an earthquake. Population, 24,900.

CATAPULTA, a military engine, employed by the ancient Greeks and Romans. It was constructed of wood and ropes in such a way that a sudden and forcible recoil could be produced, sufficient to project arrows and spears to a considerable distance. It is usually mentioned with the *ballista*, which was employed for projecting heavy stones; and in later times the two were often confounded.

CATARACT. See OPHTHALMOLOGY.

CATARRH (from *καταρρέω*, to flow down) is a term employed to describe a state of irritation of the mucous membrane of the air passages, or what is called in popular language a cold. This complaint, so prevalent in damp and cold weather, usually begins as a nasal catarrh or coryza, with a feeling of weight about the forehead and some degree of difficulty in breathing through the nose, increased on lying down. Fits of sneezing accompanied with a profuse watery discharge from the nostrils and eyes soon follow, while the sense of smell and to some extent that of taste become considerably impaired. There is usually present some amount of sore throat and of bronchial irritation, causing hoarseness and cough. Sometimes the vocal apparatus becomes so much inflamed (laryngeal catarrh) that temporary loss of voice results. There is always more or less feverishness and discomfort, and frequently an extreme sensitiveness to cold. After two or three days the symptoms begin to abate, the discharge from the nostrils and chest becoming thicker and of purulent character, and producing when dislodged considerable relief to the breathing. On the other hand, the catarrh may assume a more severe aspect and pass into some form of pulmonary inflammation (see BRONCHITIS).

A peculiar catarrhal affection occasionally occurs, in an epidemic form, to which the name Influenza is applied (see INFLUENZA).

Many remedies have been proposed with the view of cutting short a catarrh, but none of them are infallible, even where they can be safely employed. In some cases an opiate taken at the outset proves effectual for this end, but as often it will be found to fail. Entire abstinence from liquids of every kind for a period of forty-eight hours has been recommended as sufficient to cure any catarrh, but few will be found willing to submit to such a regimen. Many persons appear to think that they will get rid of a cold most quickly by continuing to go about, and, happily,

acceptation, but generally it has there a definite and technical signification. So also in Aristotle the verb *κατηγορεῖν*, to accuse, takes the specific logical sense, to predicate; τὸ *κατηγορούμενον* becomes the predicate; and *κατηγορικὴ πρότασις* may be translated as affirmative proposition. But though the word thus received a new signification from Aristotle, it is not on that account certain that the thing it was taken to signify was equally a novelty in philosophy. We do find in the records of Oriental and early Greek thought something corresponding to the Aristotelian classification.

Our knowledge of Hindu philosophy, and of the relations in which it may have stood to Greek speculation, is not yet adequate to give decisive answers to various questions that naturally arise on observation of their many resemblances, and it might therefore appear irrelevant to introduce into an historical notice of a peculiarly Western doctrine any reference to its Eastern counterpart. Yet the similarity between the two is so striking that, if not historically connected, they must at least be regarded as expressions of similar philosophic wants. The Hindu classification to which we specially refer is that of Kanada, who lays down six categories, or classes of existence, a seventh being generally added by the commentators. The term employed is *Padārtha*, meaning "signification of a word." This is in entire harmony with the Aristotelian doctrine, the categories of which may with truth be described as significations of simple terms, τὰ κατὰ μηδεμίαν συμπλοκὴν λεγόμενα. The six categories of Kanada are Substance, Quality, Action, Genus, Individuality, and Concretion or Co-inherence. To these is added Non-Existence, Privation, or Negation. Substance is the permanent sub-strate in which Qualities exist. Action, belonging to or inhering in substances, is that which produces change. Genus belongs to substance, qualities, and actions; there are higher and lower genera. Individuality, found only in substance, is that by which a thing is self-existent and marked off from others. Concretion or Co-inherence denotes inseparable or necessary connection, such as that between substance and quality. Under these six classes, *γένη τοῦ ὄντος*, Kanada then proceeds to range the facts of the universe.¹

Within Greek philosophy itself there were foreshadowings of the Aristotelian doctrine, but nothing so important as to warrant the conclusion that Aristotle was directly influenced by it. Doubtless the One and Many, Being and Non-Being, of the Eleatic dialectic, with their subordinate oppositions, may be called categories, but they are not so in the Aristotelian sense, and have little or nothing in common with the later system. Their starting-point and results are wholly diverse. Nor does it appear necessary to do more than mention the Pythagorean table of principles, the number of which is supposed to have given rise to the decuple arrangement adopted by Aristotle. The two classifications have nothing in common; no term in the one list appears in the other; and there is absolutely nothing in the Pythagorean principles which could have led to the theory of the categories.²

One naturally turns to Plato when endeavouring to discover the genesis of any Aristotelian doctrine, and undoubtedly there are in the Platonic writings many detached discussions in which the matter of the categories is touched upon. Special terms also are anticipated at various times,

e.g., *πιοιότης* in the *Theætetus*, *ποιεῖν* and *πάσχειν* in the *Gorgias*, and *πρός τι* in the *Sophist*.³ But there does not seem to be anything in Plato which one could say gave occasion directly and of itself to the Aristotelian doctrine; and even when we take a more comprehensive view of the Platonic system and inquire what in it corresponds to the widest definition of categories, say as ultimate elements of thought and existence, we receive no very definite answer. The Platonic dialectic never worked out into system, and only in two dialogues do we get anything like a list of ultimate or root-notions. In the *Sophist*, Being, Rest, and Motion (τὸ δὲ αὐτὸ καὶ στάσις καὶ κίνησις) are laid down as μέγιστα τῶν γενῶν.⁴ To these are presently added the Same and the Other (ταὐτὸν καὶ θάτερον), and out of the consideration of all five some light is cast upon the obscure notion of Non-Being (τὸ μὴ ὄν). In the same dialogue (262, sq.) is found the important distinction of *ὄνομα* and *ῥῆμα*, noun and verb. The *Philebus* presents us with a totally distinct classification into four elements—the Infinite, the Finite, the Mixture or Unity of both, and the Cause of this unity (τὸ ἀπειρον, τὸ πέρας, ἡ σύμμιξις, ἡ αἰτία). It is at once apparent that, however these classifications are related to one another and to the Platonic system, they lie in a different field from that occupied by the Aristotelian categories, and can hardly be said to have anything in common with them.

The Aristotelian doctrine is most distinctly formulated in the short treatise *Κατηγορίαι*, which generally occupies the first place among the books of the *Organon*. The authenticity of the treatise was doubted in early times by some of the commentators, and the doubts have been revived by such scholars as Spengel and Prantl. On the other hand Brandis, Bonitz, and Zeller are of opinion that the tract is substantially Aristotle's. The matter is hardly one that can be decided either *pro* or *con* with anything like certainty; but this is of little moment, for the doctrine of the categories, even of the *ten* categories, does not stand or fall with only one portion of Aristotle's works.

It is surprising that there should yet be so much uncertainty as to the real significance of the categories, and that we should be in nearly complete ignorance as to the process of thought by which Aristotle was led to the doctrine. On both points it is difficult to extract from the matter before us anything approaching a satisfactory solution. The terms employed to denote the categories have been scrutinized with the utmost care, but they give little help. The most important—*κ. τοῦ ὄντος* or *τῆς οὐσίας*, *γένη τοῦ ὄντος* or *τῶν ὄντων*, *γένη* simply, τὰ *πρῶτα* or τὰ *κοινὰ πρῶτα*, αἱ *πρώσεις*, or αἱ *διαίρεσεις*—only indicate that the categories are general classes into which Being as such may be divided, that they are *summa genera*. The expressions *γένη τῶν κατηγοριῶν* and *σχήματα τῶν κ.*, which are used frequently, seem to lead to another and somewhat different view. *Κατηγορία* being taken to mean that which is predicated, *γένη τῶν κ.* would signify the most general classes of predicates, the framework into the divisions of which all predicates must come. To this interpretation there are objections. The categories must be carefully distinguished from predicables; in the scholastic phraseology the former refer to *first intentions*, the latter to *second intentions*, i.e., the one denote real, the other logical connection. Further, the categories cannot without careful explanation be defined as predicates; they are this and something more. The most important category, *οὐσία*, in one of its aspects cannot be predicate at all.

In the *Κατηγορίαι* Aristotle prefixes to his enumeration a grammatico-logical disquisition on homonyms and synonyms, and on the elements of the proposition, i.e., sub-

¹ For details of this and other Hindu systems see Colebrooke, *Essays*; H. H. Wilson, *Essays*; Williams, *Indian Wisdom*; Gough's *Vaisheshika-Sutras*; M. Müller, *Sanskrit Literature*, and particularly his Appendix to Thomson's *Lives of Thought*.

² The supposed origin of that theory in the treatise *περὶ τοῦ παντός*, ascribed to ARCHYTAS (q.v.), has been proved to be an error. The treatise itself dates in all probability from the Neo-Pythagorean schools of the 2d century A.D.

³ Prantl, *Ges. d. Logik*, i. 74-5; Trendelenburg, *Kategorienlehre*, 209, n. ⁴ *Soph.*, 254, D.

ject and predicate. He draws attention to the fact that things are spoken of either in the connection known as the proposition, e.g., "a man runs," or apart from such connection, e.g., "man" and "runs." He then proceeds, "Of things spoken of apart from their connection in a proposition (τῶν κατὰ μηδεμίαν συμπλοκὴν λεγομένων), each signifies either Substance (οὐσία), or Quantity (ποσόν), or Quality (ποιόν), or Relation (πρός τι), or Where (i.e. Place, ποῦ), or When (i.e. Time, ποτέ), or Position (κεῖσθαι), or Possession (ἔχειν), or Action (ποιεῖν), or Passion (πάσχειν). Οὐσία, the first category, is subdivided into πρώτη οὐσία or primary substance, which is defined to be τὸδε τι, the singular thing in which properties inhere, and to which predicates are attached, and δεύτεραι οὐσίαι, genera or species which can be predicated of primary substances, and are therefore οὐσία only in a secondary sense. Nevertheless, they too, after a certain fashion, signify the singular thing, τὸδε τι (K., p. 3b, 12, 13). It is this doctrine of πρώτη οὐσία that has raised doubts with regard to the authenticity of the Κατηγορίαι. But the tenfold classification, which has also been captiously objected to, is given in an acknowledged writing of Aristotle's (see *Τῆτορία*, i. 9, p. 103b, 20).¹ At the same time it is at least remarkable that in two places where the enumeration seems intended to be complete (*Met.*, p. 1017a, 25; *Met. Pos.*, i. 22, p. 83a, 21), only eight are mentioned, ἔχειν and κεῖσθαι being omitted. In other passages² six, five, four, and three are given, frequently with some addition, such as καὶ αἱ ἄλλαι κ. It is also to be observed that, despite of this wavering, distinct intimations are given by Aristotle that he regarded his list as complete, and he uses phrases which would seem to indicate that the division had been exhaustively carried out. He admits certainly that some predicates which come under one category might be referred to another, but he declines to deduce all from one highest class, or to recognize any relation of subordination among the several classes.

The full import of the categories will never be adequately reached from the point of view taken up in the *Κατηγορίαι*, which bears all the marks of an early and preliminary study. For true understanding we must turn to the *Metaphysics*, where the doctrine is handled at large. The discussion of Being in that work starts with a distinction that at once gives us a clue. Τὸ ὄν is spoken of in many ways; of these four are classified—τὸ ὄν κατὰ συμβεβηκός, τὸ ὄν ὡς ἀληθές, τὸ ὄν δυνάμει καὶ ἐνεργείᾳ, and τὸ ὄν κατὰ τὰ σχηματὰ τῶν κατηγοριῶν. It is evident from this that the categories can be regarded neither as purely logical nor as purely metaphysical elements. They indicate the general forms or ways in which Being can be predicated; they are determinations of Being regarded as an object of thought, and consequently as matter of speech. It becomes apparent also why the analysis of the categories starts from the singular thing, for it is the primary form under which all that is becomes object of knowledge, and the other categories modify or qualify this real individual. Πάντα δὲ τὰ γινόμενα ὑπὸ τέ τινος γίγνεται καὶ ἐκ τινος καὶ τι. Τὸ δὲ τί λέγω καθ' ἐκάστην κατηγορίαν ἥ γὰρ τὸδε ἢ ποσόν ἢ ποιόν ἢ ποῦ (*Met.*, p. 1032a, 13-15). . . . The categories, therefore, are not logical forms but real predicates; they are the general modes in which Being may be expressed. The definite thing, that which comes forward in the process from potentiality to full actuality, can only appear and be spoken of under forms of individuality, quality, quantity, and so on. The nine later categories all denote entity in a certain imperfect fashion.

The categories then are not to be regarded as heads of predicates, the framework into which predicates can be

thrown. They are real determinations of Being—*allgemeine Bestimmtheiten*, as Hegel calls them. They are not *summa genera* of existences, still less are they to be explained as a classification of nameable things in general. The objections Mill has taken to the list are entirely irrelevant, and would only have significance if the categories were really—what they are not—an exhaustive division of concrete existences. Grote's view (*Aristotle*, i. 108) that Aristotle drew up his list by examining various popular propositions, and throwing the different predicates into genera, "according as they stood in different logical relation to the subject," has no foundation. The relation of the predicate category to the subject is not entirely a logical one; it is a relation of real existence, and wants the essential marks of the propositional form. The logical relations of τὸ ὄν are provided for otherwise than by the categories.

Aristotle has given no intimation of the course of thought by which he was led to his tenfold arrangement, and it seems hopeless to discover it. Trendelenburg in various essays has worked out the idea that the root of the matter is to be found in grammatical considerations, that the categories originated from investigations into grammatical functions, and that a correspondence will be found to obtain between categories and parts of speech. Thus, Substance corresponds to noun substantive, Quantity and Quality to the adjective, Relation partly to the comparative degree and perhaps to the preposition, When and Where to the adverbs of time and place, Action to the active, Passion to the passive of the verb, Position (κεῖσθαι) to the intransitive verb, ἔχειν to the peculiar Greek perfect. That there should be a very close correspondence between the categories and grammatical elements is by no means surprising; that the one were deduced from the other is both philosophically and historically improbable. Reference to the detailed criticisms of Trendelenburg by Ritter, Bonitz, and Zeller will be sufficient.

Aristotle has also left us in doubt on another point. Why should there be only *ten* categories? and why should these be the ten? Kant and Hegel, it is well known, signalize as the great defect in the Aristotelian categories the want of a principle, and yet some of Aristotle's expressions would warrant the inference that he *had* a principle, and that he thought his arrangement exhaustive. The leading idea of all later attempts at reduction to unity of principle, the division into substance and accident, was undoubtedly not overlooked by Aristotle, and Brentano³ has collected with great diligence passages which indicate how the complete list might have been deduced from this primary distinction. His tabular arrangements (pp. 175, 177) are particularly deserving of attention. The results, however, are hardly beyond the reach of doubt.

There was no fundamental change in the doctrine of the categories from the time of Aristotle to that of Kant, and only two proposed re-classifications are of such importance as to require notice. The Stoics adopted a fivefold arrangement of highest classes, γενικάτα. Τὸ ὄν or τὶ, Being, or somewhat in general, was subdivided into ὑποκείμενα or subjects, ποιὰ or qualities in general, which give definiteness to the blank subject, πὼς ἔχοντα, modes which further determine the subject, and πρὸς τι πὼς ἔχοντα, definite relative modes. These categories are so related that each involves the existence of one higher than itself, thus there cannot be a πρὸς τι πὼς ἔχον which does not rest upon or imply a πὼς ἔχον, but πὼς ἔχον is impossible without ποιόν, which only exists in ὑποκείμενον, a form or phase of τὸ ὄν.⁴

³ Brentano, *Bedeutung des Seienden nach A.*, pp. 148-178.

¹ Against this passage even the cross-grained Prantl can raise no objection of any moment; see *Ges. der Logik*, i. 206, n.

⁴ For detailed examination of the Stoic categories, see Prantl, *Ges. d. Logik*, i. 428, sqq.; Zeller, *Ph. d. Gr.*, iii. 1, 82, sqq.; Trendelenburg, *Kateg.*, p. 217.

² See Bonitz, *Index Aristotelicus*, s.v., and Prantl, *Ges. d. Log.*, i. 207.

Plotinus, after a lengthy critique of Aristotle's categories sets out a twofold list. Τὸ ἐν, κίνησις, σπάσις, ταυρότης, ἐρεπότης are the primitive categories (πρῶτα γένη) of the intelligible sphere. Οὐσία, πρὸς τι, ποιά, ποσόν, κίνησις are the categories of the sensible world. The return to the Platonic classification will not escape notice.

Modern philosophy, neglecting altogether the dry and tasteless treatment of the Aristotelian doctrine by scholastic writers, gave a new, a wider, and deeper meaning to the categories. They now appear as ultimate or root notions, the metaphysical or thought elements, which give coherence and consistency to the material of knowledge, the necessary and universal relations which obtain among the particulars of experience. There was thus to some extent a return to Platonism, but in reality, as might easily be shown, the new interpretation was, with due allowance for difference in point of view, in strict harmony with the true doctrine of Aristotle. The modern theory dates in particular from the time of Kant, who may be said to have re-introduced the term into philosophy. Naturally there are some anticipations in earlier thinkers. The Substance, Attribute, and Mode of Cartesianism can hardly be classed among the categories; nor does Leibnitz's chance suggestion of a fivefold arrangement into Substance, Quantity, Quality, Action and Passion, and Relations, demand any particular notice. Locke, too, has a classification into Substances, Modes, and Relations, but in it he has manifestly no intention of drawing up a table of categories. What in his system corresponds most nearly to the modern view of these elements is the division of kinds of real predication. In all judgments of knowledge we predicate either (1) Identity or Diversity, (2) Relation, (3) Co-existence, or necessary connection, or (4) Real existence. From this the transition was easy to Hume's important classification of *philosophical relations* into those of Resemblance, Identity, Time and Place, Quantity or Number, Quality, Contrariety, Cause and Effect.

These attempts at an exhaustive distribution of the necessary relations of all objects of knowledge indicate the direction taken by modern thought, before it received its complete expression from Kant.

The doctrine of the categories is the very kernel of the Kantian system, and, through it, of later German philosophy. To explain it fully would be to write the history of that philosophy. The categories are called by Kant Root-notions of the Understanding (*Stammbegriffe des Verstandes*), and are briefly the specific forms of the *a priori* or formal element in rational cognition. It is this distinction of matter and form in knowledge that marks off the Kantian from the Aristotelian doctrine. To Kant knowledge was only possible as the synthesis of the material or *a posteriori* with the formal or *a priori*. The material to which *a priori* forms of the understanding were applied was the sensuous content of the pure intuitions, Time and Space. This content could not be *known* by sense, but only by intellectual function. But the understanding in the process of knowledge makes use of the universal form of synthesis, the judgment; intellectual function is essentially of the nature of judgment or the reduction of a manifold to unity through a conception. The specific or type forms of such function will, therefore, be expressed in judgments; and a complete classification of the forms of judgments is the key by which one may hope to discover the system of categories. Such a list of judgments Kant thought he found in ordinary logic, and from it he drew up his well-known scheme of the twelve categories. These forms are the determinations of all objects of experience, for it is only through them that the manifold of sense can be reduced to the unity of consciousness, and thereby constituted experience. They are *a priori* conditions, sub-

jective in one sense, but objective as being universal, necessary, and constitutive of experience.

The table of logical judgments with corresponding categories is as follows:—

Judgments.		Categories.
Universal.....	I. Of Quantity	Unity.
Particular.....		Plurality.
Singular.....		Totality.
Affirmative....		Reality.
Negative.....	II. Of Quality	Negation.
Infinite.....		Limitation.
Categorical....		Inherence and Subsistence (Substance and Accident).
Hypothetical..		Causality and Dependence (Cause and Effect).
Disjunctive...	III. Of Relation	Community (Reciprocity).
Problematical		Possibility and Impossibility.
Assertorie.....		Existence and Non-Existence.
Apodictic.....		Necessity and Contingency.
	IV. Of Modality	

Kant, it is well-known, criticises Aristotle severely for having drawn up his categories without a principle, and claims to have disclosed the only possible method by which an exhaustive classification might be obtained. What he criticized in Aristotle is brought against his own procedure by the later German thinkers, particularly Fichte and Hegel. And in point of fact it cannot be denied that Kant has allowed too much completeness to the ordinary logical distribution of propositions; he has given no proof that in these forms are contained all species of synthesis, and in consequence he has failed to show that in the categories, or pure conceptions, are contained all the modes of *a priori* synthesis. Further, his principle has so far the unity he claimed for it, the unity of a single function, but the specific forms in which such unity manifests itself are not themselves accounted for by this principle. Kant himself hints more than once at the possibility of a completely rational system of the categories, at an evolution from one single movement of thought, and in his *Remarks on the Table of the Categories* gave a pregnant hint as to the method to be employed. From any complete realization of this suggestion Kant, however, was precluded by one portion of his theory. The categories, although the necessary conditions under which alone an object of experience can be thrown, are merely forms of the mind's own activity; they apply only to sensuous and consequently subjective material. Outside of and beyond them lies the thing-in-itself, the blankest and emptiest of abstractions, which yet to Kant represented the ultimately real. This subjectivism was a distinct hiatus in the Kantian system, and against it principally Fichte and Hegel directed criticism. It was manifest that at the root of the whole system of categories there lay the synthetizing unity of self-consciousness, and it was upon this unity that Fichte fixed as giving the possibility of a more complete and rigorous deduction of the pure notions of the understanding. Without the act of the Ego, whereby it is self-conscious, there could be no knowledge, and this primitive act or function must be, he saw, the *position* or affirmation of itself by the Ego. The first principle then must be that the Ego posits itself as the Ego, that the Ego = Ego, a principle which is unconditioned both in form and matter, and therefore capable of standing absolutely first, of being the *prius* in a system. Metaphysically regarded this act of self-position yields the categories of Reality. But, so far as matter is concerned, there cannot be affirmation without negation, *omnis determinatio est negatio*. The determination of the Ego presupposes or involves the Non-Ego. The form of the proposition in which this second act takes to itself expression, the Ego is not = Not-Ego, is unconditioned, not derivable from the first. It is the absolute antithesis to the primitive thesis. The category of Negation is the result of this second act. From these two propositions, involving absolutely op-

posed and mutually destructive elements, there results a third which reconciles both in a higher synthesis. The notion in this third is determination or limitation; the Ego and Non-Ego limit, and are opposed to one another. From these three positions Fichte proceeds to evolve the categories by a series of thesis, antithesis, and synthesis.

In thus seizing upon the unity of self-consciousness as the origin for systematic development, Fichte has clearly taken a step in advance of, and yet in strict harmony with, the Kantian doctrine. For, after all that can be said as to the demonstrated character of formal logic, Kant's procedure was empirical, and only after the list of categories had been drawn out, did he bring forward into prominence what gave them coherence and reality. The peculiar method of Fichte, also, was nothing but a consistent application of Kant's own Remark on the Table of the Categories. Fichte's doctrine, however, is open to some of the objections advanced against Kant. His method is too abstract and external, and wants the unity of a single principle. The first two of his fundamental propositions stand isolated from one another, not to be resolved into a primitive unity. With him, too, the whole stands yet on the plane of subjectivity. He speaks, indeed, of the universal Ego as distinct from the empirical self-consciousness; but the universal does not rise with him to concrete spirit. Nevertheless the *Wissenschaftslehre* contains the only real advance in the treatment of the categories from the time of Kant to that of Hegel.¹ This, of course, does not imply that there were not certain elements in Schelling, particularly in the *Transcendental Idealism*, that are of value in the transition to the later system; but on the whole it is only in Hegel that the whole matter of the Kantian categories has been assimilated and carried to a higher stage. The Hegelian philosophy, in brief, is a system of the categories; and as it is not intended here to expound that philosophy, it is impossible to give more than a few general and quite external observations as to the Hegelian mode of viewing these elements of thought. With Kant, as has been seen, the categories were still subjective, not as being forms of the individual subject, but as having over against them the world of *noumena* to which they were inapplicable. Self-consciousness, which was, even with Kant, the *nodus* or kernel whence the categories sprang, was nothing but a logical centre,—the reality was concealed. There was thus a dualism, to overcome which is the first step in the Hegelian system. The principle, if there is to be one, must be universally applicable, all-comprehensive. Self-consciousness is precisely the principle wanted; it is a unity, an identity, containing in itself a multiplicity. The universal in absolute self-consciousness is just pure thinking, which in systematic evolution is the categories; the particular is the natural or multifarious, the external as such; the concrete of both is spirit, or self-consciousness come to itself. The same law that obtains among the categories is found adequate to an explanation of the external thing which had so sadly troubled Kant. The categories themselves are moments of the universal of thought, type forms, or definite aspects which thought assumes; determinations, *Bestimmungen*, as Hegel most frequently calls them. They evolve by the same law that

was found to be the essence of ultimate reality—i.e., of self-consciousness. The complete system is pure thought, the Universal *par excellence*.

After the Hegelian there can hardly be said to have been a philosophical treatment of the categories in Germany, which is not more or less a criticism of that system. It does not seem necessary to mention the unimportant modifications introduced by Kuno Fischer, Erdmann, or others belonging to the school. In the strongly-opposed philosophy of Herbart, the categories can hardly be said to hold a prominent place. They are, with him, the most general notions which are psychologically formed, and he classifies them as follows:—(1) Thing, either as product of thought, or as given in experience; (2) Property, either qualitative or quantitative; (3) Relation; (4) The Negated. Along with these, he posits as categories of inner process—(1) Sensation, (2) Cognition, (3) Will, (4) Action. George,² who in the main follows Schleiermacher, draws out a table of categories which shows, in some points, traces of Herbartian influence. His arrangement by eunads, or series of nine, is fanciful, and wanting in inner principle.

The most imposing recent attempt at a reconstruction of the categories is that of Trendelenburg. To him the first principle, or primitive reality, is Motion, which is both real as external movement, and ideal as inner construction. The necessary conditions of Motion are Time and Space, which are both subjective and objective. From this point onwards are developed the mathematical (point, line, &c.) and real (causality, substance, quantity, quality, &c.) categories which appear as involved in the notion of motion. Matter cannot be regarded as a product of motion; it is the condition of motion, we must think something moved. All these categories, "under the presupposition of motion as the first energy of thought, are ideal and subjective relations; as also, under the presupposition of motion as the first energy of Being, real and objective relations."³ A serious difficulty presents itself in the next category, that of End (*Zweck*), which can easily be thought for inner activity, but can hardly be reconciled with real motion. Trendelenburg solves the difficulty only empirically, by pointing to the insufficiency of the merely mechanical to account for the organic. The consideration of Modality effects the transition to the forms of logical thought. On the whole, Trendelenburg's unique fact of motion seems rather a blunder. There is much more involved than he is willing to allow, and motion *per se* is by no means adequate to self-consciousness. His theory has found little favour.

Ulrich works out a system of the categories from a psychological or logical point of view. To him the fundamental fact of philosophy is the distinguishing activity (*unterscheidende Thätigkeit*) of thought. Thought is only possible by distinction, difference. The fixed points in the relations of objects upon which this activity turns are the categories, which may be called the forms or laws of thought. They are the aspects of things, notions under which things must be brought, in order to become objects of thought. They are thus the most general predicates or heads of predicates. The categories cannot be completely gathered from experience, nor can they be evolved *a priori*; but, by attending to the general relations of thought and its purely indefinite matter, and examining what we must predicate in order to know Being, we may attain to a satisfactory list. Such list is given in great detail in the *System der Logik* (1852), and in briefer, preciser form in the *Compendium der Logik* (2d ed., 1872); it is in many points well deserving of attention.

The definition of the categories by the able French logi-

¹ It does not seem necessary to do more than refer to the slight alterations made on Kant's Table of Categories by Herder (in the *Metakritik*), by Maimon (in the *Propädeutik zu einer neuen Theorie des Denkens*), by Fries (in the *Neue Kritik der Vernunft*), or by Schopenhauer, who desired to reduce all the categories to one—that of Causality. We should require a new philosophical vocabulary even to translate the extraordinary compounds in which Krause expounds his theory of the categories. Notices of the changes introduced by Rosmini, and of Gioberti's remarkable theory, will be found in Raginisco's work referred to below.

² *Lehrbuch der Metaphysik*, 1844.

³ *Logische Untersuchungen*, i. 376-7.

cian Renouvier, in some respects resembles that of Ulrici. To him the primitive fact is Relation, of which all the categories are but forms. "The categories," he says, "are the primary and irreducible laws of knowledge, the fundamental relations which determine its form and regulate its movements." His table and his criticism of the Kantian theory are both of interest.¹

The criticism of Kant's categories by Cousin and his own attempted classification are of no importance. Of more interest to us, though not of much more value, is the elaborate table drawn out by Sir W. Hamilton.² The generalized category of the *Conditioned* has but little meaning, and the subordinate categories evolve themselves by no principle, but are arranged after a formal and quite arbitrary manner. They are never brought into connection with thought itself, nor could they be shown to spring from its nature and relations.

J. S. Mill has presented, "as a substitute for the abortive classification of Existences, termed the categories of Aristotle," the following as an enumeration of all nameable things:—(1) Feelings, or states of consciousness; (2) The minds which experience these feelings; (3) Bodies, or external objects which excite certain of those feelings; (4) Successions and co-existences, likenesses and unlikenesses, between feelings or states of consciousness.³ This classification proceeds on a quite peculiar view of the categories, and is only presented here for the sake of completeness.

Trendelenburg, *Geschichte der Kategorienlehre*, 1846; Ragnisco, *Storia critica delle Categorie*, 2 vols. 1871. For Aristotle's doctrine the most important, in addition to Brandis, Zeller, and the above, are Bonitz, *Sitzungsber. d. kôn. Akad. d. Wissen.*, Wien, 1853, pp. 591-645; Prantl, *Ges. d. Logik*, i.; and Brentano, *Bedeutung des Seienden nach Aristoteles*, 1862. See also Schuppe, *Die Kategorien des Aristoteles*, 1866; Grote's *Aristotle*, i.; and the translations of the *Categorie* by Maimon, 1794, and Heydeureich, 1835.

CATERPILLAR. See BUTTERFLIES, vol. iv. p. 593.

CATGUT is the name applied to cord of great toughness and tenacity prepared from the intestines of sheep. It is used for the strings of harps and violins, as well as other stringed musical instruments, for hanging the weights of clocks, for bow-strings, and many other purposes where toughness, flexibility, and durability are required. To prepare catgut the intestines are cleaned, freed from fat, and steeped for some time in water, after which their external membrane is scraped off with the back of a knife or other blunt tool. They are then steeped for some time in an alkaline ley, smoothed and equalized by drawing out, bleached with sulphuric fumes, if necessary dyed, sorted into sizes, and twisted together into cords of various numbers of strands according to their uses. The best strings for musical instruments are imported from Naples; and it is found that lean and ill-fed animals yield the toughest gut.

CATHAY. See CHINA.

CATHCART, SIR GEORGE (1794-1854), British general, was born in London, May 12, 1794. He was the third son of the first Earl Cathcart, a distinguished general and diplomatist, commander-in-chief of the expedition to Copenhagen in 1807, and afterwards ambassador to Stockholm and St Petersburg. He received his early education at Eton College, and passed thence to the university of Edinburgh. In 1810 he entered the army, and two years later accompanied his father as aide-de-camp to Russia. With him he joined the Russian headquarters in March 1813; and he was present at all the great battles of the campaigns of that year in Germany, and of the

following year in France, and also at the taking of Paris. The fruits of his careful observation and critical study of these operations appeared in the *Commentaries* which he published in 1850, a volume of plain soldier-like history, prepared from notes made during the campaigns. After the peace of 1814 he accompanied his father to the Congress of Vienna; and while in that city he was appointed (March 1815) extra aide-de-camp to the duke of Wellington. He was present at Quatre-Bras and at Waterloo, was named full aide-de-camp to the duke, and remained in his staff till the army of occupation quitted France. Re-appointed almost immediately, he accompanied the duke to the Congresses of Aix-la-Chapelle and Verona, and in 1826 to Prussia. Promoted lieutenant-colonel in 1828, he served in Nova Scotia, Bermuda, and Jamaica,—retiring on half-pay in 1834. After three years he was recalled to active service, and was sent as commander of the King's Dragoon Guards to Canada, where he played an important part in suppressing the rebellion and pacifying the country. In 1844 he returned to England and again retired. Two years later he was appointed deputy-lieutenant of the Tower, and this post he held till 1852. In that year he was offered the governorship and command at the Cape. This he accepted, and had the merit of bringing to a close the Kaffre War. In December 1853 he was appointed adjutant-general of the army. In 1854 he was sent to take part as lieutenant-general in the Crimean War, and the highest hopes were fixed on him as a scientific and practically experienced soldier. But these hopes were not to be fulfilled; for he fell at the battle of Inkermann, November 5, 1854. His remains, with those of other officers, were buried on Cathcart's Hill, Lord Raglan, the commander-in-chief, attending the ceremony. Sir George Cathcart married in 1824 Lady Georgiana Greville, who survived him, and by whom he had a family of one son and seven daughters. At the time of his death he was a Knight Commander of the Bath.

CATHEDRAL, more properly CATHEDRAL CHURCH (*Ecclesia Cathedralis*), the chief church of a diocese, in which the bishop has his official seat or throne, *cathedra*. The earliest example given of the use of the term *Ecclesia Cathedralis* is in the Acts of the Council of Tarragona, in 516. Another primitive designation was "*Ecclesia mater*" or "*matrix*," indicating the cathedral as the mother church of the diocese. As being the chief house of God, *Domus Dei*, of the district, it acquired in Germany the name of *Domkirche*, and in Italy of *Duomo*. The word "*Ecclesia*" was gradually dropt, and by the 10th century the adjective "*cathedralis*" took rank as a substantive, which it has successfully maintained in most of the modern languages of Europe. The essential distinction between a cathedral and all other churches, viz., that it is the church of the bishop, containing his throne of office, or *bishop's stool*, as our Saxon forefathers termed it, is thus well expressed by Hooker (*Ecc. Polit.*, vii. 8, 3), "To note a difference of that one church where the bishop hath his seat, and the rest which depend upon it, that one hath been usually termed *cathedral*, according to the same sense wherein Ignatius, speaking of the Church of Antioch, termeth it his throne; and Cyprian, making mention of Evaristus, who had been bishop and was now deposed, termeth him *cathedræ extorrem*, one that was thrust besides his chair. The church where the bishop is set with his college of presbyters about him we call a *see*; the local compass of his authority we term a *diocese*." A bishop's *see*, strictly speaking, a bishop's seat (*sedes*, *siège*), or *cathedra*, and is only in a secondary sense applied to the church in which that seat is placed, and the city in which that church stands. From this it follows that a church may lose its cathedral rank by the transference of the

² *Discussions*, p. 577.

³ *Logic*, i. 83; cf. Bain, *Ded. Log.*, App. C.

bishop's see to another church, which by that transference at once assumes the dignity lost by the other. Thus the Oxfordshire Dorchester was the cathedral of the vast East Mercian diocese, until in 1072 Remigius removed the *cathedra* to Lincoln, while the West Mercian prelates at one time had their see at Chester before it was finally fixed in its earlier habitation at Lichfield. Thus also in 1088 the abbey church of Bath became the cathedral of Somersetshire, which for nearly two centuries had been at Wells, where after a brief sojourn at Glastonbury the bishop's throne was again permanently set up in 1206. Towards the close of the 12th century the cathedral of Canterbury was in some danger of losing its rank, the continuance of the monks having caused Archbishop Baldwin to conceive the idea of transferring his official seat to the church of Hackington, which would in that event have become the cathedral of the Kentish diocese, and the metropolitan church of England. Such a plan was actually carried out when, early in the 13th century (1220), Bishop Poore deserted the cathedral of Old Sarum, and founded the existing cathedral of Salisbury. The period of the Reformation saw the abbey churches of Bristol, Chester, Gloucester, Oxford, and Peterborough, and for a short space Westminster, elevated to cathedral rank by being made the seat of a bishop, a change which has been witnessed in the present century by the establishment of the sees of Ripon and Manchester. While we are writing, the church of Cumbrae has become the cathedral of the Scottish diocese of Argyll and the Isles, and the abbey church of St Albans is only waiting for the completion of preliminary necessary arrangements to be constituted the cathedral for the counties of Hertfordshire and Essex.

By very early canons it was decreed that cathedrals should only be established in chief cities. The Council of Laodicea (361), following the legislation of the Council of Sardica (347), prohibited the appointment of bishops in villages or country places. Throughout the Roman empire, where the ecclesiastical coincided with the civil divisions, the seats of religious authority were fixed in the same spots as the seats of temporal authority, the bishop placing his *cathedra* in the city where the temporal governor had planted his curule chair. In Britain, however, where, in the early days when the church first developed her power, cities were but few and insignificant, the case was different. The bishop was rather the bishop of a district or of a tribe than of a city. The position of his cathedral was dictated by motives of convenience and security rather than by the dignity and populousness of the site. Not unfrequently the *cathedra* was migratory. This state of things drew to an end with the conclusion of the 10th century, when the country became more settled, and the Roman system was finally ratified by the Council of London (1075), which ordered that episcopal sees should be removed from unwall'd villages to wall'd cities. In obedience to this decree the cathedrals of Salisbury, Chichester, and Chester (the last only temporarily) were created,—succeeding to the episcopal dignity of those of Sherborne, Selsoy, and Lichfield (Freeman, *Hist. of Norman Conquest*, vol. iv. pp. 414-420). Other transferences of only slightly later date were those already mentioned from Dorchester to Lincoln, and from Wells to Bath, as well as that of the East Anglian see from Elyham to Thetford and thence to Norwich.

Wherever established, the cathedral church was regarded as being, what it usually was in fact, the mother-church of the district dependent upon it. This district was for the first three centuries designated the *parochia* (*παροικία*) of the bishop. Gradually the term *diocese* (*διοίκησις*), originally signifying a civil province of the lesser sort, came to be transferred to ecclesiastical divisions, to the

exclusion of the earlier name, which in its forms, *parish*, *paroisse*, *parrocchia*, &c., was restricted to the smaller ecclesiastical districts, each containing a single church. Cathedrals in their original idea possessed much of a missionary character. The district of which they were the ecclesiastical centre in general received the light of religious truth from them. They were the headquarters of the bishop and his clergy, from which they went forth for the evangelization of the heathen inhabitants—*pagani*, i.e., dwellers in the *pagi*, or surrounding country villages. To this also they returned as their home for rest and refreshment, as well as for necessary conference. In the words of Dean Milman,—“Christianity was first established in the towns and cities, and from each centre diffused itself with more or less success into the adjacent country. . . . The churches adjacent to the towns or cities either originally were or became the diocese of the city bishop” (*Hist. of Christianity*, bk. iv. c. i. § 2). Thus, as Hooker says, “Towns and villages abroad receiving the faith of Christ from cities wherunto they were adjacent, did, as spiritual and heavenly colonies, by their subjection honour those ancient mother churches out of which they grew” (*Ecl. Polit.*, bk. vii. c. 8, § 2). In some cases, however, especially in Britain, the history of the cathedral was different. The missionary element was the same; but instead of starting with a bishop as the centre of organized action, establishments of missionary priests were formed, with a church as the focus of their religious life and a monastery as their home, which only tardily attained cathedral rank by the appointment of a bishop to preside over them. The cathedral of Worcester is instanced by Professor Stubbs in this relation, as an example, “like Canterbury itself, of a successful missionary establishment, thus attaining its due development” (“Cathedral of Worcester in the 8th century,” *Archæol. Jour.*, vol. xix. p. 244). The history of the missionary work of the Church of England during the early part of the present century reproduced this same system. The missionary clergy preceded the bishop, and cathedral dignity was imposed on a church not originally erected with any such object. The last twenty years have seen a return to the other more primitive plan of operation. In newly-constituted dioceses in Africa and elsewhere, the bishop takes the lead among his clergy in date of constitution as he does in official rank, and the cathedral church is one of the first requirements to be provided for. The true character and object of a cathedral church and establishment are thus well set forth by Bishop Stillingfleet:—“Every cathedral in its first institution was as a temple to the whole diocese, where the worship was to be performed in the most decent and constant manner; for which end it was necessary to have such a number of ecclesiastical persons there attending as might still be ready to do all the offices which did belong to the Christian church,—such as constant prayer and hymns and preaching and celebration of sacraments,—which were to be kept up in such a church, as the daily sacrifice was in the Temple.” Though it was the church of the bishop, it was essential for its completeness that he should be surrounded by his college of presbyters, as the members of the body of which he was the head. The purpose of this collective body was threefold:—(1.) Consultative,—as the *concilium episcoporum*, by whose advice he might be strengthened in all important matters concerning the diocese; (2.) Ministerial,—for the maintenance and celebration of public worship in its most reverent and dignified form, *cum cantu et jubilatione*; and (3.) Diocesan,—as the bishop's officials in the administration of his diocese, prepared also to go forth at his bidding to act as missionaries or evangelists in any part to which he might see fit to send them. In this way there sprang up

the body known as the "chapter" of the cathedral,—a body originally in the closest connection with the bishop, and having no corporate existence apart from him. This collective body sometimes consisted of "seculars," *i.e.*, of clergy not bound by monastic vows, living in the world, with separate homes of their own; sometimes of "regulars," *i.e.*, of clergy living according to a monastic rule, residing in one religious community, and sharing in common buildings. Of both bodies the bishop was the head. When the cathedral was the church of a monastery and was served by regulars, the bishop was regarded as the abbot; and when the chapter consisted of a college of secular clergy, it owed allegiance to no one but the bishop himself. The "dean," the present head of all English cathedral chapters, was a comparatively late addition, not appearing till the 10th or 11th century. He had been preceded by the *præpositus*, a "provost," who occurs in the 8th and 9th centuries. Earlier still we find the "archpresbyter," who was gradually supplanted by the archdeacon exercising chief authority among the cathedral clergy, but always in strict subordination to the bishop. Another chief officer of the church—one, with the two last, of the "*tria culmina ecclesiæ*"—was the "custos" or "primicerius," a title he derived from his name being that first entered on the waxen tablet or list. The strange contradiction by which the bishop has less authority in the church of which he is the titular head, and which takes its distinctive appellation from his throne, than in any other church in his diocese, only gradually came into existence. It was partly a result of the increase of his diocesan duties, partly of his transformation into a great political officer of the state, and partly of the organization of the chapter as an independent corporation. When travelling over his wide-spread diocese, or attending upon the king as chancellor, or other high officer, the bishop had no leisure to attend to the internal administration of his cathedral, and the authority naturally tended to attach itself to the permanent chief of the chapter, while he gradually sank into a mere external visitor called in when needed to correct abuses, or as an arbiter to settle disputes. Under the bishop as its nominal head the chapter of a fully organized cathedral, when it was formed of secular priests, consisted of the *quatuor personæ*, or four chief "dignitaries" of the church, and a body of "canons" or "prebendaries." The four high officers were—(1.) the "dean," as the general head of the whole capitular body, charged with the internal discipline of the corporation; (2.) the "præcentor," or "chanter," who was charged with the management of the choir, and the musical arrangements of the service; (3.) the "chancellor," the literary-man of the chapter, who, as theological professor, superintended the education of its younger members, delivered lectures himself, and procured the delivery of sermons by others, had the care of the library, and wrote the letters of the body; and (4.) the "treasurer," not in the modern fiscal sense of the word, but the officer to whose care were entrusted the treasures of the church, its sacred vessels and altar furniture, reliquaries, and other ornaments. With these were usually united the "archdeacons," varying in number with the size of the diocese, who were, however, more diocesan than cathedral officers. Next after these dignitaries the main body of a cathedral chapter consisted of "canons" or "prebendaries." The former name they received originally from being enrolled on the "canon" or list of ecclesiastical officers, though subsequently it was supposed to have reference to their being bound by canons, *i.e.*, rules. The additional title of prebendary was given to those canons who enjoyed a separate estate (*præbenda*), in virtue of their position, besides their share of the corporate funds. These names were, generally speaking, two different designations

for the same individual. A canon was usually, though not always, a prebendary; but a prebendary, as a member of the capitular body, was always a canon. The life of the canon was separate, not cœnobitic. Each had his own house and his private establishment. The attempt of Chrodegang, archbishop of Metz (who died in 766), to force a semi-monastic rule on canons, with a common refectory and common dormitory, though eagerly adopted by the Emperor Charlemagne, was short-lived. By the middle of the 9th century the rule was indeed established in almost all the cathedrals of France, Germany, and Italy, and had also been adopted in England. But its strictness proved unpalatable to the canons. It was gradually relaxed everywhere, and found no acceptance in England. The distinction between "residential" and "non-residential" canons had its origin in the attempt to combat the evils consequent on pluralities. The canons having other preferments were, by the end of the 12th century, generally non-resident. Their cathedral duties were performed by "vicars" receiving a small stipend. To attract them into residence the divisible part of the corporate revenue was ordered to be shared among those canons who had resided for a certain term. This created a degree of confusion, as there was no certainty how many canons would reside during a given year. To obviate this irregularity the duty of residence was laid on a fixed number of canons only, who were to discharge the ordinary duties of the cathedral on behalf of the whole body (Freeman *Cathedral Essays*, pp. 148-149). The establishment of "vicars," or, as they are now more usually but unstatutably called, "minor canons," as a regular and permanent part of the cathedral body, originally due to non-residence, was sanctioned through the inability of some of the canons to take their part in the choral service of the church. In most cathedrals each officer had his deputy. Thus we find the "sub-dean," the "sub-chanter" or "succentor," the "vice-chancellor," as recognized members of the cathedral staff. Another officer is the "prælector," or lecturer in theology, who in some cathedrals executes the duties elsewhere performed by the chancellor.

We have been speaking hitherto of the cathedrals of secular canons. The monastic cathedrals differed little from ordinary monasteries, save in being governed, in the almost constant absence of their titular abbot, the bishop, by a prior as the real head of their society. Cathedrals of this class are peculiar to England and Germany, which received its religion mainly from England. The monks or regular clergy who served them were, in England, everywhere of the Benedictine order, except at Carlisle, where they were Austin canons.

The distinction between monastic and secular cathedrals in England was perpetuated at the Reformation under the new titles of "Cathedrals of the Old Foundation" and "Cathedrals of the New." In the cathedrals of the former class the foundation remained substantially unchanged. But the monasteries attached to cathedrals having been suppressed by Henry VIII., together with the other religious houses, these cathedrals were founded afresh as chapters of secular canons presided over by a dean. These new chapters were eight in number, *viz.*, Canterbury, Durham, Winchester, Carlisle, Ely, Norwich, Rochester, and Worcester. The members of the chapter were designated, not canons, but prebendaries, an improper appellation, as none had any separate estate or "præbenda" assigned to them. The highest number of these new prebendaries was twelve, at Canterbury, Durham, and Winchester; the lowest was four, at Carlisle. With these monastic cathedrals may be classed the new sees formed by Henry VIII. from existing monasteries, *viz.*, Bristol,

Chester, Gloucester, Oxford, and Peterborough. The constitution of these cathedrals was similar to those of the other monastic cathedrals, and the codes of statutes almost identical. In all the cathedrals of the New Foundation the precentor, instead of being a chief dignitary second only to the dean, is one of the minor canons.

The cathedrals of the Old Foundation, whose constitution has not been materially changed since the 13th century, and which are in some instances still governed by pre-Reformation statutes, are those of York, London, Chichester, Exeter, Hereford, Lichfield, Lincoln, Salisbury, and Wells, together with those of the four Welsh bishoprics—Bangor, Llandaff, St Asaph's, and St David's. Monastic cathedrals being nearly peculiar to England and Germany, these Old Foundation cathedrals "are those whose history and constitution has most in common with the churches of Scotland, Ireland, and Western Christendom generally" (Freeman, *u.s.*, p. 139).

To these must be added the two recently-erected cathedrals of Manchester and Ripon. In each of these cases advantage was taken of an existing collegiate establishment on which to graft a cathedral. No provision is made in the Act for the founding of the see of St Alban's for the creation of a capitular body.

The legislation of 3 and 4 Victoria reduced all the cathedrals of England and Wales to a uniform constitution. The normal type is that of a dean and four canons. Canterbury, Durham, and Ely, however, have six canons a-piece, and Winchester and Exeter five. To remove still further the distinction between cathedrals of the Old and New Foundation, a body of honorary canons was called into being in the latter to correspond to the prebendaries of the former foundations. The prebendal estates having been alienated, the honour in each case is equally a barren one.

In not a few of the English cathedrals the due performance of the choral service is provided for by a corporation of "lay vicars," forming in some cases an independent body endowed with estates of their own. The chorister boys also in some cases are supported and educated from the proceeds of separate estates. The "priest vicars," or "minor canons," in several instances, also have their own estates and form a corporation by themselves.

It does not fall within the scope of the present article to enter upon the ritual and architectural history of cathedrals. In neither of these respects do they differ essentially from other important and dignified churches.

CATHERINE, SAINT. The Roman hagiology contains the record of no less than six saints of this name, viz. :—

1. St Catherine, virgin and martyr, whose day of commemoration recurs on the 25th of November; 2. St Catherine of Sweden, who died abbess of Watzen, on the 24th March 1381, and is commemorated on the 21st of that month; 3. St Catherine of Siena, born in 1347, whose festal day is observed on the 30th of April; 4. St Catherine of Bologna, whose family name was Vigri, and who died abbess of the Convent of St Clairs in that city on the 9th March 1463; 5. St Catherine of Genoa, who belonged to the noble family of Fieschi, was born about 1448, spent her life and her means in succouring and attending on the sick, especially in the time of the plague which ravaged Genoa in 1497 and 1501, died in that city in 1510, was canonized by Clement XII. in 1737, and had her name placed in the calendar on the 22d of July by Benedict XIV.; and 6. St Catherine de' Ricci, of Florence, born of that noble family in 1522, who became

a nun in the convent of the Dominicans at Prato, died in 1589, and was canonized by Benedict XIV. in 1746, who fixed her festal day on the 13th February.

All these women are recorded by the chroniclers of the Roman Church to have worked miracles. Indeed without this essential qualification they could not have been canonized. The lives of all, save that of Catherine of Genoa, whose career was a more active one, having been spent mainly in the hospitals of her native city, were passed in the practice of the ordinary monastic virtues. St Catherine de' Ricci was subject to long trances and visions. And of St Catherine of Genoa it is recorded, that that miracle of levitation (or being raised from the ground), which is asserted with such curious frequency to have happened to various saints, frequently happened to her, when she was in the act of receiving the Holy Communion.

Of all these saints, however, it will only be necessary here to say a few words of the earliest of the name, who is the person intended when the Roman Church speaks of St Catherine without any additional designation, and then to give a somewhat more detailed account of the far most celebrated and historically important of them all, St Catherine of Siena.

History has exceedingly little to tell of this saint; history, more properly so called, indeed, has nothing at all. She is said to have been of royal parentage, and her life is referred to the early part of the 4th century. She was martyred at Alexandria. She was especially celebrated for her learning and philosophical culture, and has always been considered the especial patron of philosophical schools. But in proportion to the scantiness of authenticated fact, legendary fable has been abundant in furnishing forth lives of the saint. And it is to one of these legends that the well-known presentiment of the saint, which alone is likely to cause modern readers to feel any interest in her name, is due. It is said that in revenge for the discomfiture of a company of heathen philosophers, with whom she had been compelled to dispute, the holy and learned lady was bound to a wheel armed with spikes, in such sort that every turn of the machine would cause the spikes to pierce her body. But the cords were miraculously broken, and the malice of her enemies foiled. Hence St Catherine, virgin and martyr, is always represented with a wheel, and the extreme popularity of this saint, and consequent commonness of the pictures of her, is indicated by the fact that a wheel of a certain construction and appearance is to the present day called a Catherine wheel. The lover of mediæval painting may be warned against mistaking the pictures, which he so constantly meets with, of St Catherine with her wheel, for representations of St Catherine of Siena, or of any of the other saints Catherine, who all of them lived a thousand years or more later than the first and original saint of the name.

St Catherine of Siena, born in that city in the year 1347, was a daughter of Giacomo Benincasa, said by the hagiographers to have been a descendant of the noble family of Borghese, also of Sienese origin,—a connection, however, which has been repudiated by the nobles of that subsequently Papal family. It seems certain, however, that the two families were sprung from the same stock. The researches of Signor Grottanelli, the present librarian of the municipal library at Siena, have enabled him to construct a pedigree of the saint, which may be considered as perfectly authentic, from which it appears that she was one of thirteen children; and that her father Giacomo, who died when she was one-and-twenty, in 1368, had been one of ten. Her mother Lapa, who was the grand-daughter of a "poeta volgare,"—that is to say, a poet who wrote in the then nascent Italian tongue,—lived to be eighty-nine.

St Catherine, Virgin and Martyr.

St Catherine of Siena

To her and to one of her brothers, and to two of her nieces, sundry of the saint's letters are addressed.

As is usual in the Roman hagiography, the first and contemporary biographer of St Catherine, her confessor, the Dominican friar Raimondo (he was great-grandson of the celebrated Pietro delle Vigne, the chancellor of the Emperor Frederick II., and became the 24th general of the Dominican order), insists largely on the tendency towards sanctity which marked Catherine in her earliest years. The austerities and self-inflictions by which she prepared herself for her career, and gave proof of her vocation to those around her, began at an incredibly early age, and went on increasing in intensity till they pass from the probable to the highly improbable, and thence to the manifestly miraculous. At five years old it was her practice in going up stairs to kneel at each step to the Virgin. She habitually flogged herself and induced other children to do the same, at six years of age. At seven she deprived herself of a great portion of her food, secretly giving it to her brother, or throwing it to the cats. At the same age she would watch from the window to see when a Dominican monk passed, and as soon as he had moved on, would run down and kiss the spot of the pavement on which he had placed his feet. At twelve years old her mother begged her to comb her hair and wash her face oftener. But this she steadily refused to do, till her mother requested a married sister to use her influence with Catherine, to which for a time she yielded to a certain degree. This yielding, however, she often in after-life, as her confessor testified, bewailed with bitter tears of penitence, always mentioning it, when she made, as she was in the habit of doing frequently, a general confession of her sins.

About the same period of Catherine's life, her twelfth year, she wholly abandoned the use of animal food. At fifteen she left off wine. At twenty she gave up bread, living only on uncooked vegetables. She used to sleep but one quarter of an hour in the four and twenty. She always flogged herself till the blood streamed from her three times a day. She lived three years without speaking. She wore a chain of iron round her body, which gradually ate its way into her flesh. And, finally, she remained wholly without food for many years. Catherine began, we are told, to have visions at six years old. Returning home one day, about that time, through the streets of Siena, she saw in the sky, immediately over the Dominican Church, a throne with Christ sitting on it, dressed in Papal robes, accompanied by St Paul, St Peter, and St John.

But these practices of her infancy, and these early visions were but preparatory to the wonders of a later period. Christ appeared to her daily as soon as she retired to her cell, as she informed Father Raimondo, for the purpose of teaching her the doctrines of religion, which, as she said to her confessor, "no man or woman ever taught me, but only Our Lord Jesus Christ himself, sometimes by means of inspiration, and sometimes by means of a clear bodily appearance, manifest to the bodily senses, and talking with me, as I now talk with you." A detailed account of these manifestations will be found in the pages of Father Raimondo.

It is necessary to give some account of one miraculous occurrence, which was deemed the great and culminating glory of the saint, and has occupied the most prominent position in her estimation by the church, and in the imaginations of her admirers. This is the supernatural impression on her hands and feet of the scars of wounds corresponding with those made in the hands and feet of the Saviour by the nails which fixed Him to the cross. This is stated to have occurred at Pisa, and is asserted by Father Raimondo to have happened in his presence. Catherine had received the sacrament, and fell, as usual

with her at such times, into a trance. Her confessor and some others were awaiting her recovery from it, when they saw her suddenly rise with a start to a kneeling posture, with her arms stretched out horizontally, and in a minute or two more fall prostrate. Soon afterwards she came out of her trance, and immediately calling aside her confessor said, "Be it known to you, my father, that I now bear on my body the marks of the crucifixion of our Lord Jesus Christ." "And I," continues Father Raimondo, "having told her that I had observed as much from the movements of her body, while she was in her trance, asked her in what manner the Lord had performed that miracle? And she said, 'I saw the crucified Lord descending towards me with a great light, which caused me, from the impetus of my soul to meet its Creator, to raise up my body. Then I saw five bloody rays descending from the scars of his most holy wounds, and directing themselves to the hands and feet and heart of my body. Upon which, knowing what the mystery was, I exclaimed, O, Lord, my God, let not, I pray you, the scars appear externally on my body, it is enough for me to have them internally. Then, while I was yet speaking, the rays, before they reached me, turned from blood-colour to a pure and splendid light, and touched the five parts of my body—that is my hands, my feet, and my heart.' I asked her further, Do you now feel in those spots any sensible pain? To which, with a deep sigh, she replied, 'So great is the pain. I feel in all those five places, but especially in my heart, that it appears impossible to me to live many days, unless the Lord perform some further miracle.'"

In order to appreciate the importance and bearing of this celebrated miracle, the fierce and bitter rivalry which existed between the Dominicans and Franciscans must be borne in mind. St Francis had, some half century previously, received these five wounds in the same way. The marks are familiarly known among hagiographers and their readers as the *Stigmata*; and the having received them was considered the crowning glory of St Francis, and was the exclusive boast of his Franciscans. But now the Dominicans were even with them. The Sienese Pope, who canonized his townswoman Catharine, Pius II., gave his approbation to a service, in which this reception of the *stigmata* was prominently asserted. And so severely was the blow felt by the indignant Franciscans that they obtained from the next Pope but one, Sixtus IV., himself a Franciscan, a decree to the effect that St Francis had an exclusive right to and monopoly of that especial miracle, and that it was accordingly forbidden to represent St Catherine receiving the *stigmata* under pain of ecclesiastical censures. The tendency observable in many of the austerities and miracles said to have been suffered and done by St Catherine, to outdo the austerities and miracles of other saints, especially St Francis, is particularly remarkable in this of the *stigmata*. The degree in which it served the purpose of the Dominicans is the measure of the suspicion attaching to it. But there is nothing incredible in the supposition that Catherine may have imagined in her trance all that she had related; and still less is it unlikely that such diseased dreamings may have been the natural product of a waking fancy, filled with, and dwelling on, this much envied manifestation. Perhaps the condition, so providently introduced, as it would seem, that the scars were not to be visible, may be suggestive of a fraudulent intention. But on the other hand, it may be observed that if such a fraud had been planned, it would have been easy for one, who habitually subjected her body to so much suffering, to submit to the required wounds beforehand. It will, however, probably be felt by most readers of the above quoted narrative of Father Raimondo that it bears on the face of it many of the marks of untruth-

fulness. The monk's statement that he had known what was taking place from the movements of her body would seem to be very suggestive of a foregone purpose and plan. On the other hand it may be argued that this is so obvious, that the monk would never have committed himself to such a statement had not it been the simple truth.

The celebrated and learned Tomasseo, whose literary reputation probably stands higher with his countrymen than that of any other living writer, and who is the latest writer on St Catherine, accepting her works and character in the spirit of an enthusiastic devotee, writes in the essay on St Catherine, which he has prefixed to the latest edition of her works (4 vols., Florence, 1860), as follows: "If by the mere play of the imagination a person, who has had a limb cut off, feels, nevertheless, pain in the part which has been removed; if the force of thought often creates bodily ills and cures them, it would be in contradiction to all philosophy and all the laws of criticism to deny that a woman rendered by love profoundly apprehensive of the sufferings of another, may feel pain in her own person, in that same spot of the body where the loved person feels or felt it. It would be to deny to Catherine that privilege of sympathizing piety and tender humanity, which we grant to the French mother, who exclaims, *J'ai mal à la poitrine de ma fille!* And for Catherine Jesus was alive, was present in her heart, in her eyes. All her being, as all the world, was full of him." The recognized phenomenon, however, to which the eloquent philologist refers is a purely physiological one; and it is for physiologists to determine what amount of analogy may be discoverable between that known fact and the sensation of bodily pain from which Catherine declared herself to be suffering, when she had recovered from her trance;—or rather that respecting which Catherine is said to have made such a declaration by the Dominican her confessor and biographer. For in weighing the extremely curious question of the amount of conscious imposture which may probably be supposed to have been mingled with other elements in the extraordinary narrative, it is very necessary to remember that we have the testimony and statements of Catherine only through the medium of the general of the order, to the fame and glory of which Catherine's saintly fame and glory was so all-important.

It is important to observe in this connection that various statements of her confessor will leave little doubt on the minds of those who have made that form of malady called catalepsy their study, or even of those who have witnessed the phenomena attending it, that Catherine was subject to constantly-recurring attacks of catalepsy. And physicians will probably deem the hint above thrown out, to the effect that the saint was in the habit of throwing herself into this state "as much as she could," not unimportant. It is unnecessary in this place to do more than call attention by a passing word to the very remarkable similarity between some of the phenomena described by Father Raimondo and those attending many very well-known cases of animal magnetism.

But if doubts and difficulties crowd thickly about the whole of that portion of Saint Catherine's story which has obtained for her the pre-eminence of saintship, it may be said that the public events of her life, which make part of the undoubted history of her time, are hardly less extraordinary and surprising. In the year 1376, the 29th of Catherine's life, Gregory XI. was living and holding the Papal court at Avignon. He was the last of seven French Popes in succession who had done so, and had perpetuated for seventy-three years what ecclesiastical writers are fond of terming "the Babylonian captivity of the church." To put an end to this absenteeism, and to bring back the Papacy to Italy was the cherished and anxious wish of all

good Italians, and especially of all Italian churchmen. Petrarch had urgently pressed Urban V., Gregory's immediate predecessor, to accomplish the desired change; and Dante had at an earlier date laboured to bring about the same object. But both had failed in front of the great difficulties which attended the step. The French cardinals, who surrounded the Pope, were anxious, of course, to detain him in France. The king of France threw all his influence into the same scale. The French Pope's own prejudices and wishes were, of course, enlisted on the same side. Rome itself and the dominions of the church, which the violence and usurpations of the Roman barons kept in a chronic state of rebellion, made the Eternal City anything but an inviting residence. There was also considerable truth in the representations insisted on by several of the French Popes, that the rising importance of the northern churches had in a great degree changed the central point of the ecclesiastical world, and that the church could more advantageously be governed from a French than from an Italian city. Thus all the influences which Italy had for many years past striven to bring to bear upon the popes, to induce them to return to their own city had failed. And it was under these circumstances that Catherine, the illiterate daughter of an obscure Sienese dyer, determined to try her powers of persuasion and argument for the accomplishment of that which the princes of the church and the greatest men of Italy had in vain attempted. For this purpose Catherine proceeded to Avignon in the summer of 1376. And in the September of that year the Pope set out on his return to Rome. It is true that he did this, intending after a sojourn in the Eternal City to return to France, and he would almost certainly have done so, had he not been prevented by death. But the dyer's daughter did, as things fell out, succeed in her enterprise, and moved the centre of Europe back again once more to its old place in Rome! Of course it may be said that to attribute the Pope's return to Rome to Catherine's intervention is a notable instance of a *post hoc ergo propter hoc* inference. But many proofs might be given from various writers to show that it was unquestionably believed in her own day that Catherine had been the real moving cause of the restoration of the Papacy to Rome. (See especially Annirato, *Istorie Fiorentine*, vol. v. p. 130, ed. Flor., 1824.) After many other journeyings she arrived in Rome on the 28th of November 1378, in obedience to the commands of the Pope; and there she died on the 29th of April 1380, at the age of thirty-three. Father Raimondo was then at Genoa, and declares that in that city, at the hour of her death, he heard a voice communicating to him a last message from Catherine, which he afterwards found she had uttered on her deathbed word for word as he heard it, "and of this," he adds solemnly, "let that Eternal Truth, which can neither deceive nor be deceived, be witness."

Catherine's works consist of a treatise occupying a closely-printed quarto volume, which Father Raimondo describes as "a dialogue between a soul, which asked four questions of the Lord, and the same Lord, who made answer and gave instruction in many most useful truths,"—of her letters, 373 in number, and of 26 prayers. The dialogue is entitled, *The Book of Divine Doctrine, given in person by God the Father, speaking to the mind of the most glorious and holy virgin Catherine of Siena, and written down as she dictated it in the vulgar tongue, she being the while entranced, and actually hearing what God spoke in her.* The work is declared to have been dictated by the saint in her father's house in Siena, a little before she went to Rome, and to have been completed on the 13th of October 1378. This dialogue has been divided into five parts, though no such division existed in it as it fell from her lips. The first four parts exist in manuscript, as taken down from the lips of the entranced saint; but the fifth treatise is not extant in the original, but only in the Latin version of Father Raimondo, from which the published Italian version has been re-translated. The French oratorian, Father Casimir Oudin, in his supplement of

ecclesiastical writers, omitted by Bellarmine, says very quietly, "She wrote, or Raimondo de Vinci wrote in her name, a work inscribed," &c., &c. And it is very possible that the suspicion indicated may be a just one; but there is nothing in the matter of the work itself to belie the origin attributed to it. It may be remarked, however, that the context, as it stands, does not even pretend to give the unbroken utterances of the saint. It is intermingled, without any advertisement to the reader, typographical or other, that ho is about to enter on matter of a different authorship, with long passages descriptive of the saint's mode of receiving the revelation, written in the person of the secretary. But the saint's own utterances are exactly such as might have been expected from such a patient. They resemble the worst and emptiest style of the pulpit eloquence of her time and country, and consist entirely of mere verbose and repetitive inanities and platitudes. It is impossible to read them without being strongly reminded of the productions, which have been given forth in these latter days as spiritual communications made to persons in trance or otherwise constituting themselves "mediums,"—a similarity which suggests sundry curious considerations. The most probable supposition seems to be that these "dialogues" were composed by Father Raimondo, from notes taken down from Catherine's trance ramblings. The 26 prayers might have been expected to throw more light on the character and mental calibre of the saint, whose communings with the Infinite they represent. But nothing of the kind is to be gathered from them. The impression they are calculated to produce is either that the saint was a self-conscious actor and pretender, or that they are not her compositions,—the latter perhaps being the more probable hypothesis. Though addressed in form to the Deity, there is little in these effusions that can with accuracy be called prayer. The speaker, or rather writer, seems continually to forget his avowed object, and runs off into long statements of the nature and attributes of the Deity, and ecclesiastical positions based thereon, evidently prompted rather by didactic views as to mortal hearers, than by effort to hold communion with the Almighty. It is all dry, cold, repetitive, verbose theology, instead of the warm utterances of either a contrite or a thankful heart. It remains to say a few words of the saint's letters, by far the most interesting and valuable of her reputed works. They are 373 in number, and form two stout quarto volumes of the Lucca edition. In the four octavo volumes of the recent cheap Milan reprint, only the first 198 are given, though no word appears to indicate that the collection is imperfect. On the contrary, the fourth volume is entitled "4th and last." Still more recently the letters have been reprinted by Barbèra at Florence, 1860, in 4 vols. small octavo, with a preliminary notice of the saint prefixed by the celebrated Niccolò Tommaseo, consisting of 210 pages. The 373 letters of the entire collection have among them many addressed to kings, popes, cardinals, bishops, conventual bodies, and political corporations, as well as a great number written to private individuals. And it seems very strange that among so many correspondents of classes whose papers are likely to be preserved, and many of whom, especially the monastic communities, would assuredly have attached a high value to such documents, no one original of any of these documents should have been preserved. Girolamo Gigli, the editor of the quarto edition of the saint's works, printed at Lucca and Siena, 1707-13, an enthusiastic investigator and collector of every description of information regarding her, gives, in his preface to the letters, a careful account of the manuscript collections from which they have at different times been printed, but has not a word to say of any scrap of original document. The epistles were first printed by Aldus in 1500, just 120 years after Catherine's death. The difficulties connected with the subject of the true authorship of these letters are much complicated by questions respecting Catherine's capability of writing, and her own statements of the miraculous manner in which she acquired that accomplishment. The discussion of these difficulties would require a larger space than can here be allotted to the subject. And the reader curious on the subject may be referred to a life of the saint by Mr Trollope, from which much of the present notice has been taken. It is admitted on all hands, however, that a large portion of the letters were written by the hands of secretaries. The very high reputation, and that not wholly of a pietistic or ecclesiastical nature, which this large mass of writings has enjoyed for several centuries will probably appear to most English readers an extremely singular fact. A great deal of the praise bestowed on St Catherine's writings by Italian critics has reference to their style and diction. Written at a time when the language, fresh from the hands of Dante, of Petrarch, and of Boccaccio, was still in its infancy, and in a city at all times celebrated for the purity of its vernacular, they have by the common consent of Italian scholars taken rank as one of the acknowledged classics of the language,—as a *testa di lingua*, as the Tuscan purists say. The Della Crusceans have placed them on the jealously-watched list of their authorities, and an enthusiastic Siennese compatriot, the before-mentioned Girolamo Gigli, has completed a *vocabulario Catheriniano*, after the fashion of those consecrated to the study of the works of Homer and Cicero. Of course no one from the "barbarous"

side of the Alps can permit himself any word of observation on this point, especially when the judgment is in the main confirmed by the authority of the greatest of living Italian critics, Niccolò Tommaseo. Had no such decisive opinion been extant to guide his ignorance, it might perhaps have seemed to a foreigner that the saint's style was loose in its syntax, inextricable in its construction, and terribly overloaded with the merest verbosity. But the philological excellencies of her writings are, after all, the least part of the praise that has been lavished on Catherine as an author. Her admirers enlarge on the moving eloquence, the exalted piety, the noble sentiments, the sound argumentation of her compositions, especially the letters.

So large a number of devout writers have occupied their pens on "legends" and biographies of Saint Catherine that it would be far too lengthy a task to attempt to give even a list of them. The public library of Siena contains no less than 79 works of which the popular saint of the city is the subject. Almost all of them, however, seem to be based more or less directly and avowedly on the work of Father Raimondo. And enough has been said to give the reader a sufficient idea of the nature of that book. Of Girolamo Gigli's *Vocabulario Catheriniano* mention has also been made. Of course it will readily be understood that this work regards the saint's writings in a purely philological point of view. But the curious fate which attended this work may be noticed. It was burned by the hangman at Florence, not because it was supposed to contain any heterodoxy in matter of religion, but merely because the Della Crusca, which is occasionally somewhat slyly satirized in it, was enraged at the position taken up by the author, to the effect that the Siennese is a purer dialect of Italian than the Florentine! The notice of Saint Catherine by Niccolò Tommaseo, prefixed to the most recent edition of St Catherine's works, has also been mentioned. It cannot be called "a life" in any sense. For the author makes no attempt to relate the story of her career, or to examine the evidence for any of the anecdotes which he does relate. It is written in a strain of enthusiastic pietistic admiration, which is certainly curious in the case of a highly-cultured 19th century layman; and its principal value consists in the judgment on the purely literary merits of the writer, by one who must be admitted to be the greatest living critic of Italy. (T. A. T.)

CATHERINE I., wife of Peter the Great of Russia, and after his death for two years (1725-27) empress of Russia, was the natural daughter of a country girl in Livonia. Being left utterly destitute when a mere child, she was brought up by a Lutheran pastor of Marienburg, named Glück. About 1702, at a pretty early age, she was married to a Swedish dragoon, from whom, however, she was almost immediately separated by the vicissitudes of war. She never saw him again; for she was carried off by the Russian forces, and was slave or mistress to more than one Russian general, last of all to Prince Menschikoff, in whose house she attracted the notice of the czar. The czar was struck by her beauty and good sense, and made her his mistress, and then his wife publicly in 1711. After that, in the same year, she performed a service to her husband for which she will always be remembered in history. In the campaign on the Pruth, Peter, with an excessive contempt of the generalship and other military qualities of the Turks, had rashly placed himself in a position in which he was completely surrounded and cut off from all supplies. From this peril he was relieved by Catherine, who was expert enough to collect the necessary sum for bribing the Turkish general, and in this way to bring about a tolerable peace. Next year she was solemnly crowned empress at St Petersburg. She continued to be the faithful companion and adviser of the czar, till his death in 1725. After that event she was herself raised to the Russian throne, chiefly through the address of her former lord, Prince Menschikoff, who put himself at the head of a powerful party, and gained over the guards at the capital. Her reign of two years was in no wise remarkable. Menschikoff was her minister, and directed affairs almost at his pleasure. Catherine was by no means free from the vices then prevalent at the Russian court. She spent whole days in dissipation, which hastened her end. She died in 1727, being somewhere about forty years of age. She was evidently a woman of considerable insight and expertness, able to manage the

eccentric czar in his violent and extravagant moods, and above all capable of sympathizing with him, and assisting him in his great schemes, though she could neither read nor write.

CATHERINE II., empress of Russia, was born at Stettin in 1729; by the dethronement of her husband Peter III., and the exclusion of her son, she ascended the Russian throne in 1762, and occupied it till her death in 1796. Her father, who was prince of Anhalt-Zerbst in Upper Saxony, served in the Prussian army. Her mother, a peevish, hard-tempered, and pedantic German of the old school, gave her a severe education, which, however, did not crush but strengthen the masculine temper of her daughter.

The Empress Elizabeth, having selected her nephew Peter, the duke of Holstein Gottorp, as her successor on the throne, had requested a sister of Frederick of Prussia to be the wife of the future emperor. But aware of the extraordinary manners then prevalent at the Russian court, Frederick shrunk from the proposal and suggested the princess of Anhalt-Zerbst. Proposals being made in that quarter and thankfully accepted, the princess, whose original name was Sophia Augusta, was conducted to Russia by her mother in 1744; after some preliminary religious instruction she received the name of Catherine, and was admitted into the Greek Church, and was at length in 1745 with due splendour married to Peter, who was only a year older than herself. The marriage proved an unhappy and ill-assorted one. While Catherine grew up to be a handsome, strong-minded, and ambitious lady, Peter passed his life apparently on the very borders of idiocy. Though not destitute of generous and even noble impulses, he was silly, wayward, and extravagant. Excluded from all serious employment, and indeed incapable of it, he spent his time in drilling a troop of dogs that he kept in a kennel adjoining his wife's sleeping apartments, executed martial law on the rats he used to train to the same military functions, and felt very angry when Catherine ventured to laugh at the extravagance of his proceedings. From early boyhood he had been habituated to strong drink, and, as he grew up, he was intoxicated every day. He insisted, too, on making his own wife his confidante in the ceaseless love intrigues he carried on with the ladies of the court. Such was the husband to whom the poor girl of fifteen was married, and the man who was to have uncontrolled power over a vast empire. For a long time Catherine did her best to induce him to act in a reasonable way, but with little success. His wild and drunken habits continued, and, from mere caprice as much as anything else, he became more and more alienated from her.

Though Catherine was thus severely tried during those early years of her married life, the natural firmness of her character bore her through, and her great gentleness and adroitness soon enabled her to gain firm footing in the court. She set herself resolutely to learn the Russian language, and soon acquired a perfect mastery of it. She made herself thoroughly acquainted with the history, manners, and institutions of the country, and identified herself completely with the people around her, so that she became a thorough Russian in character and sympathies, and, when occasion required, knew how to move the Russian heart. The best foreign culture of her time, too, she made thoroughly her own, being an assiduous reader of French literature during the long inactive hours of her youth. Voltaire and the other *philosophes* of the 18th century were her favourite authors; she professed to be a disciple of the new humanity they preached, expressed the highest reverence for them, and corresponded with some of them in after-life.

In this way, while her husband wasted his life in every kind of grotesque extravagance, Catherine was engaged in cultivating her mind, and in learning to understand her

strange surroundings. Indeed the Russian court of that era was nearly as extraordinary as her husband. Since the death of Peter the Great (1725) the crown had been again and again a plaything in the hands of intriguing courtiers, mostly of German origin. To accomplish a revolution, to pull down one ruler and set up another, and despatch the leaders of an opposing faction to Siberia, it was necessary only to gain over a few of the guards. In such a way had Elizabeth, youngest daughter of Peter the Great, won the crown in 1741. She had some natural capacity for command, but lived in the utmost licence, in which she was only too perfectly imitated by the court. Placed in such a position as this, Catherine had a difficult part to play, and required for it all the deftness and insight of her nature. But she succeeded. She gradually acquired a considerable influence over the mind of Elizabeth, who admired her cleverness and beauty. The courtiers of both sexes learned to respect her. Even Peter came to recognize the superiority of her understanding, and though he never liked her, used to ask her advice in his many perplexities. But she did not escape the contagion of the court. In accordance with the prevailing custom, she became involved in one love intrigue after another. Consequently, when children were at length born of her (Paul, the eldest, in 1753), their paternity was matter of serious doubt.

In this way she lived till the beginning of 1762, when the death of Elizabeth opened the way to a very different career. The poor, half-imbecile Peter was now called on to leave his silly employments, and undertake the government of the most extensive empire in the world. All the schemes he embarked in were marked by a wild generosity and sense of justice; but, unhappily, in almost every one he managed to give deadly offence to the susceptible national spirit of Russia. Being a devoted admirer of the great Frederick, he gave back with impetuous haste all the advantages won in the Seven Years' War, sent home all the Prussian prisoners, restored the provinces torn from Prussia, and concluded peace and then an offensive and defensive alliance with his hero. Himself a Lutheran in his early years, he made little account of the religious etiquette of the Russian court, and still further alarmed the clergy by threatening to lay hands on the property of the church, while he grievously offended the soldiery by introducing the Prussian uniform and the severe Prussian drill. The ambition of Catherine would probably have been satisfied with the prospect of governing Russia through her husband, but he was too wayward a person to be an obedient instrument; and he soon publicly insulted her beyond forgiveness by compelling her to decorate his mistress, the Countess Woronzoff, with the order of St Catherine. This and other matters, and the growing alienation of a long and distasteful married life, brought on a crisis. It became clear that they could not live together; and Catherine began to adopt precautionary measures in self-defence. She had little difficulty in doing so most effectively. The Orloffs, influential persons in the Russian guards, were devoted to her; the eldest, Gregory, was her lover. Those men, with the help of the Princess Dashkoff, Count Panin (the tutor of her son Paul), and others, planned the overthrow of Peter. Early on the morning of the 9th July (1762), Catherine was awakened at the palace of Peterhof by Alexis Orloff with the injunction to act immediately; they had been betrayed. Accordingly, she set out for the capital, and finding Gregory Orloff on the spot, appealed to the guards, who were easily induced to raise the standard of revolt. In the church, the priests anointed her regent in the name of her son, while, outside, the Orloffs had her proclaimed empress in her own right. After that, going in procession through the streets she was joyously saluted empress of

Russia. In the meantime, Peter, all unaware of what was going on, was busy drilling his favourite German guards at Oranienbaum. On proceeding to Peterhof he found that Catherine had vanished, and suspected the truth. He was urged to fight, but all his fortitude forsook him. Next day he abdicated, expecting freedom to retire to Holsteiu; but he was compelled to proceed to Ropscha, where on the 17th, the Orloffs, after an unsuccessful attempt to poison him, strangled him with their own hands in the most revolting manner. Of this part of the proceedings Catherine seems to have had no knowledge. Thus easily, and apparently to the satisfaction of those concerned, was a revolution effected, by which a beautiful and ambitious woman, a foreigner, ascended the Russian throne, to the exclusion of the rightful occupants. For some time, however, Catherine did not feel quite secure, and had to trust to the influence of her admirers in suppressing discontent. The soldiery at Moscow were disposed to resent the liberties taken by their compeers in the disposal of the crown, and even among the guards at St Petersburg doubtful symptoms appeared. But, eventually, they were all bribed or threatened into acquiescence. A conspiracy formed to place on the throne Ivan (a descendant of a brother of Peter the Great), who had already been emperor a few months in 1740, also proved abortive, and cost that unfortunate prince his life. Ten years later (1773), a Cossack, Pugatcheff, who gave himself out for the dethroned Peter, raised an insurrection in the Volga region, which, being supported by many of the extreme orthodox party and by the peasantry, threatened to prove formidable. But the undisciplined bravery of his troops was of no avail against the forces of Catherine; he was defeated, taken, and executed at Moscow. Her son Paul, whom she disliked and neglected, was placed under the strictest surveillance to the end of her reign.

As soon as she was securely seated upon the throne, Catherine began to attend to the foreign interests of her empire. Here she zealously observed the traditions of Russia. Debarred in so many ways from the free development of their resources, and surrounded in almost every direction by weak and semi-barbarous neighbours, the Muscovites had been constantly aiming at the extension of their frontiers especially towards the sea. This policy Catherine took up, and no native Russian could have better carried it out in its calculating steadiness and unscrupulousness. One of her first steps (1763) was to expel the Saxon duke of Courland, and to put Biron, a creature of her own, in his place; and by ceaseless intrigue she so managed things in Courland, that it was eventually glad to be incorporated with the Russian empire (1795). Towards Frederick she took a threatening attitude at the beginning of her reign; but finding nothing offensive to herself in the correspondence of the king with her late husband, and seeing that great profit might be derived from the good-will of Prussia, she concluded with it an offensive and defensive alliance, which continued to the end of Frederick's reign.

It was chiefly with a view to Poland that this treaty of alliance was made. The first result of it was the advance of a Russian army to the Vistula to compel the election of Poniatowski, an old lover of Catherine, to the throne of Poland (1763). But this was only the beginning of troubles. The old question of the toleration of dissenters soon turned up; one confederation, that of Radom, was formed by a party of Polish nobles to enforce, and another, that of Bar, to resist toleration. Catherine supported the former. The confederation of Bar was defeated and broken up, and its members fled over the frontiers to Turkey and Austria (1768). The Turks, alarmed and incensed at the progress of Russia on Polish

ground, fanatically rushed into a war (1768-1774) for which they were not prepared, and were disgracefully beaten both by land and sea. The Russian arms marched victoriously through Bessarabia, Moldavia, and Wallachia to the banks of the Danube; while a fleet, led chiefly by English seamen, sailed from Cronstadt round the coasts of Western Europe into the Mediterranean, and after sweeping the Levant burned the Turkish fleet in Tehesme Bay (1770).

After the Turks had been so thoroughly disabled, Catherine had leisure once more to attend to the state of Poland. The *liberum veto*, the freedom of confederation, the want of a middle class, the want of union and of a healthy public spirit, the oppression and brutalizing of the peasantry, and many other causes, had reduced Poland to a state of incurable disease which it is impossible to describe. During the Seven Years' War the Russian armies had incessantly marched unchallenged over the Polish territory; that splendid opportunity for shaking off the northern incubus was allowed to pass away. Lately, famine and pestilence had so ravaged the country that pigs and dogs devoured the unburied bodies of men; a loaf of bread could not be had for a hundred ducats. But it was from no benevolent feelings towards Poland that Catherine wished to interfere with its territory; instead of favouring the efforts made towards political improvement, her aim was simply to prolong the state of anarchy till she was ready to enter upon as large a share of it as possible. Frederick was the first to suggest a partial partition of Poland as the best way out of many existing difficulties. The project was dropped for a time, till Catherine took it up, and invited Prussia and Austria to join in it. An agreement was at last come to (1772); and a common fund was raised to bribe the Polish diet, which gave its consent the following year. Catherine, in this and the two ensuing partitions, seized the lion's share, in all about two-thirds of the Polish territory. By the peace of Kainardsehi with the Turks (1774), who resigned all pretensions of supremacy over the Tartars in Southern Russia, Catherine was free to occupy all the northern shore of the Black Sea. One Tartar khan was expelled, and another was induced to abdicate; the Tartars were massacred, and a flourishing country reduced to a wilderness. The Crimea, Kuban, and Taman were finally annexed to the Russian empire (1783).

Towards 1787 Catherine began to entertain still more magnificent schemes of conquest. She made a progress as far as Kherson through the midst of flourishing towns, villages, and farms, by fine roads, amidst festivals and illuminations, all of which Potemkin had artificially extemporized in the wilderness, in order to convince her how flourishing the recent conquests were. One of the gates of Kherson bore the inscription, "This is the way to Byzantium." Catherine was going to fulfil the dreams of her French flatterers by chasing the Turk from Europe, and restoring the Byzantine empire. The Turks were accordingly provoked into a new war (1787-92), and were again beaten everywhere. Important events in Poland, however, arrested the progress of Catherine on the Danube, and induced her to make a peace with Turkey (Jassy, 1792), by which the Dniester became the boundary between the two countries.

England and Prussia had been taking a hostile attitude to Russia. Under the furtherance of Hertzberg, the Prussian minister, many reforms had been introduced into Poland, and a constitutional hereditary monarchy established (1792). But a confederation of nobles, opposed to these salutary changes, invoked the aid of Catherine, who was only too glad of an opportunity to interfere; and as the progress of the French Revolution began to upset all existing political combinations, and to discredit everything

like constitutionalism in governing quarters, Prussia found it prudent to acquiesce in the arrangements of Catherine. She restored all the old abuses and seized upon whatever territory pleased her, allowing Prussia a small share of it (1793). The resulting attempt at a national rising of Poland under Kosciuszko failed; the Russian armies entered the heart of Poland and stormed Warsaw (1794); and along with Austria and Prussia, Catherine effected the last partition in 1795.

Thus was an event consummated, which some historians denounce as the foulest deed in the history of the world, and others justify not only as necessary to the order and tranquillity of Europe, but as a vindication of Heaven's laws on those who have contemned them. In any case, Catherine must almost alone bear the responsibility of it, and in her it would be useless to seek for any other motive than an unscrupulous ambition. She had skilfully taken her measures for it, in securing the acquiescence or co-operation of Prussia and Austria, and in finally pushing it on while these and the other powers of Central and Western Europe were more and more involving themselves in the terrible struggles of the Revolution. She was a great hater of the Revolution; but while others were endeavouring to suppress it, she profited by the opportunity to accomplish the partition of Poland.

In the domestic government of Russia, Catherine professed to act on the principles she had learned from her French teachers. Most of her plans, however, proved illusory, in a country where all the elements and conditions of an ideal theory of government were wanting, even if Catherine had been perfectly resolute in her aims. The attempt to introduce a code of laws on the model of Montesquieu was a failure; but in the administration, especially the administration of justice, in the furtherance of education, of industry, and of commerce, real improvement seems to have been effected. All her schemes vitally suffered in two ways: from the absence of trustworthy public servants, and from the defects of her own character. In this, as in other reigns, bribery and corruption were prevalent to an extraordinary degree, and Catherine intrusted the government to her favourites and to upstarts, to the exclusion of the nobility. In the capital, at her court, and in her own circle there reigned the most systematic immorality, which she encouraged by her example. French admirers used to call her the Semiramis of the North. Mr Carlyle calls her a female Louis Quatorze. She justified both comparisons by her beauty, her masculine ambition, and her summary disregard of virtuous restraint. One favourite was dismissed after another; but Potemkin eclipsed all others by the extraordinary union of qualities most requisite for success in Russia,—beauty, daring, extravagance, ambition,—and in the length of time his influence over Catherine continued. From 1775 till his death in 1791, that is, for a period of sixteen years, he was supreme; after Catherine's personal inclination for him had abated, he supplied her with new favourites and retained the power for himself, in all essential points directing Russian politics during that long period. To all her lovers she was munificent, not only during their season of favour, but after their dismissal, loading them with presents and pensions to such an extent, that altogether they are estimated to have cost Russia about £20,000,000. Towards the end of her reign discerning men began to fear that such extravagance, and the corruption attendant upon such a state of things, might lead to the exhaustion of the empire. In fact, the magnificence of her court, the marvellous extent of her empire, her foreign conquests, and the imposing position she held among the sovereigns of the world, only served to bring into more painful relief the moral corruption, the semi-

barbaric violence, the hard-hearted cruelty, and systematic unscrupulousness which characterized the Russian court and the Russian policy. Things grew worse towards the end of her reign. The progress of the French Revolution damped all her sentimental enthusiasm for reform. The friend and correspondent of Voltaire and D'Alembert, and the patroness of Diderot, lived long enough to prohibit the publication of French works in Russia. She died of apoplexy in November 1796. The best account of Catherine's early life is contained in the *Memoirs* written by herself in French, of which there is an English translation (1859). See also Hermann's *Geschichte Russlands*; Carlyle's *Friedrich the Second*, vol. vi.; Rulhière's *Histoire ou anecdotes sur la Révolution de Russie en l'année 1762*, and his *Histoire de l'Anarchie de Pologne*. (T. K.)

CATHERINE DE' MEDICI (1519–1589), the wife of one French king, and the mother of three, was born at Florence in 1519. She was a daughter of Lorenzo de' Medici, that ruler of Florence for whom Machiavelli wrote the *Prince*. Having lost both her parents at an early age, Catherine was sent to a convent to be educated; and she was only fourteen when she was married (1533) to the duke of Orleans, afterwards Henry II. It was her uncle, Pope Clement VII., who arranged the marriage with Francis I. Francis, still engaged in his life-long task of making head against Charles V., was only too glad of the opportunity to strengthen his influence in the Italian Peninsula, while Clement, ever needful of help against his too powerful protector, was equally ready to hold out a bait. During the reign of Francis, Catherine exercised no influence in France. She was young, a foreigner, a member of a state that had almost no weight in the great world of politics, had not given any proof of great ability, and was thrown into the shade by more important persons. For ten years after her marriage she had no children. In consequence, a divorce began to be talked of at court; and it seemed not impossible that Francis, alarmed at the possible extinction of the royal house, might listen to such a proposal. On hearing of it, Catherine, with her fine Italian tact, found her way into the presence of the king, threw herself at his feet, and expressed her readiness to submit to the royal pleasure, either to remain the wife of his son, or in case another wife should be chosen, to be one of her humblest attendants. This appeal won the heart of Francis, the divorce was no more heard of, and Catherine had the happiness of bringing him grandchildren ere he died. During the reign of her husband, too (1549–1559), Catherine lived a quiet and passive, but observant life. Henry being completely under the influence of his mistress, Diana of Poitiers, she had little authority. This continued even after the accession of her son Francis II. Francis was under the spell of Mary Stuart, and she, little disposed to meddle with politics on her own account, was managed by her uncles, the cardinal of Lorraine and the duke of Guise.

On the death of Francis, Catherine became regent during the minority of her second son, Charles IX., and now found before her a career worthy of the most soaring ambition. The new king was only ten years old. France was falling into a most critical condition. The opposition between the Reformation and the old religion was now beginning to assume a pronounced and openly hostile character, and the struggle was much intensified by the fact that most of the nobles who supported the Reformation represented also the old cause of feudal resistance to the centralizing tendencies of the court. The House of Guise were at the head of the Catholic party; Coligny and the Prince of Condé were the leaders of the Huguenots. Michel l'Hôpital, who, by the neutrality of his position and the disinterestedness of his character, was the fittest to

advise Catherine, recommended the national policy of taking no side in the contest,—by the enforcement of toleration, of civil reform, and of justice to all parties, to raise the Government above the region of controversy, and prevent civil war. Catherine took the advice in so far as to avoid siding decidedly with either party, but her character, and the habits of policy to which she had been accustomed, rendered her incapable of any noble aim. She had only one virtue, and that was her zeal for the interests of her children, especially of her favourite third son, the duke of Anjou. Like so many of the Italians of that time, who were almost destitute of a moral sense, she looked upon statesmanship in particular as a career in which finesse, lying, and assassination were the most admirable, because the most effective weapons. By habit a Catholic, but above all things fond of power, she was determined to prevent the Protestants from getting the upper hand, and almost equally resolved not to allow them to be utterly crushed, in order to use them as a counterpoise to the Guises. Thus she is, more than any one else, responsible for the thirty years of civil war that was thenceforward to devastate France. For a time her plan succeeded well enough. At the battle of Dreux (1562) the Huguenots were defeated by the duke of Guise; and at the siege of Orleans, the duke himself, now her most formidable rival, fell by the hands of an assassin. She had undoubtedly become the most important personage in France, but rage and suspicion so possessed men's minds, that she could no longer control the opposing parties, and one civil war followed another to the end of her life. But it is with the massacre of Bartholomew (24th August 1572) that her name will be especially associated in history. While the affection of the young king for Coligny inspired him with groundless confidence, Catherine decoyed the Protestant leaders to Paris by the prospect of a marriage between Henry of Navarre and her daughter Marguerite. Anxious for her own influence over Charles IX., and true to her favourite plan of perpetuating the feud between the Huguenot leaders and the House of Guise, she wrought upon the king's mind till he consented to the death of Coligny, while the unprincipled hate of the Guises and the fanaticism of the mob did the rest. In short, Catherine supplied all the preliminary conditions of the massacre, and then let loose the infuriated passions that were to consummate it. After the death of Charles in 1574, and the succession of Anjou under the name of Henry III., Catherine pursued her old policy; but as her influence is lost in that of her son, it is unnecessary to dwell upon it. She died in 1589, a short time before the assassination of Henry, and the consequent extinction of the House of Valois.

(See Martin's *Histoire de France*, vol. ix.; Michelet; Ranke's *Geschichte Frankreichs*, vol. i.)

CATHERINE OF ARAGON (1485–1536), the first queen of Henry VIII., and the youngest child of Ferdinand and Isabella of Spain, was born the 15th December 1485, while her mother was on her way to Toledo from the Spanish army, then engaged in the conquest of Granada. The first four years of her life were passed in the camp before Granada; after the taking of the city it became the capital and the residence of the court. Here, then, Catherine spent her youth, carefully educated by her mother, herself a woman of no common learning and ability, during a period of marvellous prosperity for Spain, while the Moors were being finally conquered, America was discovered, and the Spanish chivalry was in its very bloom. In 1501, being requested in marriage by Henry VII. for his eldest son Arthur, Catherine embarked at Corniña, landed at Plymouth the 2d October, and, with the usual pageantry, was united to Arthur the month following. Their marriage was of no long duration; in the April of next year Arthur

died. His widow, however, continued to reside in England, as proposals were made and accepted for her betrothal to Henry, second son of Henry VII., now heir-presumptive to the throne. Catherine, already eighteen, was disinclined to an engagement with a boy of thirteen; nevertheless the ceremony of betrothal took place in 1503. The marriage did not take place till 1509, after the accession of Henry to the throne, a dispensation from the Pope having been procured. The early years of the marriage were happy enough. Henry was a handsome, affable, and jovial king, fond of magnificent display, covetous of distinction in the tilting ground, and ambitious of popularity. His wife had the good sense to humour him in his favourite diversions, while she herself lived a dignified self-denying life of almost conventual strictness, conscientious in the performance of her religious duties, devoted to her husband, kind to her friends, charitable to her enemies, and careful of the interests of her adopted country. In the year of Flodden (1513) she was regent of the kingdom during the absence of Henry in France, and performed the duties of that office with great courage and ability. But the repeated loss of children cast a gloom over those years. Three sons died almost as soon as they were born; Mary, a sickly child, born in 1516, was the only survivor.

It was not till 1527 that Henry's scruples as to the validity of his marriage with Catherine became public, though there can be no doubt his affections had been alienated from her long before. It was anticipated by Henry and Clement that the conventual habits of Catherine would have rendered it easy for her to retire from the throne, and spend the rest of her life in a monastery. But they were mistaken; however submissive she might be to her husband in everything else, and however ready to act charitably towards the minor irregularities of his conduct, she was resolved not to allow any doubt to be cast upon the legality of their marriage or the title to the throne of her daughter Mary, nor to surrender any of her rights as queen. This the Papal legate, Campeggio, soon found out on his arrival in England in 1528. After long hesitation, and much tortuous diplomatic manœuvring on the side of the Pope, a court, consisting of the legates Campeggio and Wolsey, was at last constituted, 28th May 1529, at Blackfriars, to hear the case of the royal parties. Catherine appeared only to protest against the legality of the court; and then after a solemn address to the king for justice, appealed to the Pope, and withdrew. Notwithstanding the proceedings for the divorce, and the fact that Henry had brought Anne Boleyn to live in the palace, Catherine and he were not quite separated till the beginning of 1531, when, finding he could not prevail upon her to withdraw her appeal to the Pope, or in any way to give up her passive resistance, he commanded her to retire from Windsor. After that she never saw him again, nor her daughter Mary. Her residence was often changed; but it was principally at Ampthill. At length an open declaration of the Pope against Henry obliged the monarch to solve the difficulty by the assertion of the royal supremacy (1531). In a court held at Dunstable, Cranmer, recently appointed archbishop of Canterbury, pronounced the marriage of Henry and Catherine null and void (1533). Naturally, Catherine, though still as charitably disposed as ever towards Henry, treated this and all other attempts to deprive her of her rights with resolute contempt. Her health, which had begun to fail long before the divorce was agitated, now completely gave way. After writing a letter of forgiveness and of gentle admonition to her husband, and taking all the care she could of her faithful attendants, she died at Kimbolton Castle the 7th January 1536. (See Miss Strickland's *Queens of England*, vol. iv.; Froude, vol. i.; Lingard, vol. v.)

CATHERINE OF BRAGANZA (1638–1705), queen of Charles II. of England, was born at Villa Vigosa in Portugal, 25th November 1638. Her father, John, duke of Braganza, who was rightful heir to the crown of Portugal, then under Spanish sway, headed the revolt of 1640, which after many years' fighting succeeded, and became king of Portugal. Her mother was a woman of great ability, and governed Portugal after the death of her husband. She was penetrating enough to foresee the Restoration in England, and, some years before, proposed the marriage of Charles with her daughter Catherine, in order to secure an ally in the prolonged struggle against Spain. After the Restoration the marriage was agreed upon, not without much diplomatic manoeuvring, especially on the side of Spain, which was naturally averse to it. The marriage treaty was very advantageous to England, as the Portuguese promised a dowry in money of £500,000, the towns of Tangier and Bombay (the first English possession in the East), and many privileges of trade with their colonial dependencies. On his marriage at Plymouth, 13th May 1663, Charles expressed himself highly pleased with his Portuguese bride. But the union did not prove a happy one. Catherine had been brought up in a convent, and therefore had not the tact and the manners suited to one of the most fashionable and profligate courts of Europe. But the principal fault lay in the heartless and inconstant nature of Charles. He insisted on bringing to court his abandoned mistress, Lady Castlemaine, and, when the queen expressed her indignation at the insult, made Clarendon himself lecture her on the duty of submission. Gradually Charles's neglect of her grew into a feeling of settled alienation, and after repeated humiliations her spirit was broken. Being a Roman Catholic, too, she was an object of suspicion and calumny during the Popery panics. Perhaps the only satisfaction she enjoyed from her connection with England was the decisive aid rendered by the country to her native land in its struggle against Spain. After a life of great retirement during the reign of James II. and the early part of that of William, she returned to Portugal in 1692. Some little time before her death (at the close of 1705), she acted with great ability in the capacity of regent to her brother, Don Pedro. She had no children.

CATHERINE OF VALENTINOIS (1401–1437), consort of Henry V. of England, was born at Paris in 1401. She was most unfortunate in her early years; for her father, Charles VI., king of France, was subject to prolonged fits of insanity, and her mother, one of the most abandoned women of her time, neglected her children to such an extent that they were often without suitable food and clothes. At last, in one of his lucid intervals, Charles had her children separated from their mother, and Catherine, the youngest of them, was sent to a convent to be educated. On his accession to the English throne in 1413, Henry V. asked Catherine in marriage; but as the proposal was coupled with the demand of a large dowry in money, and especially the restitution to England of the provinces once held in France, it was unceremoniously rejected. In the invasion of France which ensued, Henry proved himself so able to assert his claims, and the country had been thrown into such a state of distress and disorder, that the court of Charles, then under the control of Philip of Burgundy, was fain to comply with all the demands of the English king. Accordingly Henry, who had already seen and loved Catherine, received her in marriage at Troyes in 1420, and, along with her, the immediate possession of the provinces claimed, the regency of France during the life of his father-in-law, and the reversion of the sovereignty of France. Early next year Catherine was solemnly crowned at London. In December 1421, Henry VI. was born at Windsor. Catherine was

again in France, when her royal husband died (1422). She returned to London with the funeral cortege; but, after taking some part in the arrangements connected with the regency during her son's minority, she almost disappears from the history of the country. The only remarkable circumstance of her subsequent life is her secret marriage. Her second husband, Owen Tudor, was sprung from a princely house of Wales, had followed Henry to his French wars, and had been made a squire of his body for bravery displayed at Agincourt. Subsequently, he became an officer in the queen's household, and in this capacity gained her affections. He seems to have been a man of high character; but as his position in England was of the lowest, the marriage was for many years kept a profound secret. The vexations the queen had to endure in consequence of its ultimate disclosure probably hastened her death, which took place in 1437. As is well known, her eldest son to Owen Tudor was created earl of Richmond, and, marrying Margaret Beaufort, the heiress of the house of Somerset and representative of the junior branch of John of Gaunt, became the father of Henry VII., and the ancestor of the Tudor line of kings.

CATHOLIC (Gr. *καθολικός*, general, universal), a designation adopted at a very early period by the Christian church to indicate its world-wide universality in contrast with the national particularism of Judaism. It has also been used by ecclesiastical writers, from Ignatius downwards, to denote the church as the depository of universally-received doctrine (*quod semper, quod ubique, et quod ab omnibus*) in contrast with heretical sects. In the latter or exclusive sense it is still claimed on the ground of historic continuity by the Roman Catholic Church; but the claim, in so far as it is exclusive, is, of course, not recognized by other Christian denominations. See ROMAN CATHOLIC CHURCH.

CATHOLIC APOSTOLIC CHURCH, a religious community often called "Irvingites," but not itself acknowledging any other name than that of "the Catholic Apostolic Church," which, the members say, belongs to them in common with the whole of baptized Christendom. The relation of the celebrated preacher Edward Irving to this community was, as they state it, somewhat similar to that of John Baptist to the early Christian church, i.e., he was the forerunner and prophet of the coming dispensation, not the founder of a new sect; and indeed the only connection which Irving seems to have had with the existing organization of the Catholic Apostolic body was in "fostering spiritual persons who had been driven out of other congregations for the exercise of their spiritual gifts." Shortly after Irving's trial and deposition, certain persons were at some meetings held for prayer designated as "called to be apostles of the Lord" by certain others claiming prophetic gifts. In the year 1835, six months after Irving's death, six others were similarly designated as "called" to complete the number of the "twelve," who were then formally "separated" by the pastors of the local congregations to which they belonged to their higher office in the universal church on the 14th July 1835. This separation is understood by the community not as "in any sense being a schism or separation from the one Catholic Church, but a separation to a special work of blessing and intercession on behalf of it." The twelve were afterwards guided to ordain others,—twelve prophets, twelve evangelists, and twelve pastors, "sharing equally with them the one Catholic Episcopate," and also seven deacons for administering the temporal affairs of the Church Catholic. The central episcopacy of eight-and-forty was regarded as "indicated by prophecy," being fore-shown in the forty-eight boards of the Mosaic Tabernacle. For ecclesiastical purposes the church universal is under their charge in twelve tribes; for Christendom is considered

to be divided into twelve portions or tribes, each tribe being under the special charge of an apostle and his co-ministers, and the seat of the Apostolic College being at Albury in England.

For the service of the church a comprehensive book of liturgies and offices was provided by the "apostles;" and lights, incense, vestments, holy oil, water, chrism, and other adjuncts of worship have been appointed by their authority. The ceremonial in its completeness may be seen in the church in Gordon Square, London, and elsewhere. The daily worship consists of "matins" with "proposition" (or exposition) of the sacrament at 6 A.M., prayers at 9 A.M. and 3 P.M., and "vespers" with "proposition" at 5 P.M. On all Sundays and holy days there is a "solemn celebration of the Eucharist" at the high altar; on Sundays this is at 10 A.M. On other days "low celebrations" are held in the side-chapels, which with the chancel in all churches correctly built after apostolic directions are separated or marked off from the nave by open screens with gates.

Each congregation is presided over by its "angel" or bishop (who ranks as pastor in the Universal Church); under him are four-and-twenty priests, divided into the four ministries of "elders, prophets, evangelists, and pastors," and with these are the deacons, seven of whom regulate the temporal affairs of the church—besides whom there are also "sub-deacons, acolytes, singers, and door-keepers." The understanding is that each elder, with his co-presbyters and deacons, shall have charge of 500 adult communicants in his district; but this has been but partially carried into practice. This is the full constitution of each particular church or congregation as founded by the "restored apostles," each local church thus "reflecting in its government the government of the Church Catholic by the angel or high priest Jesus Christ, and His forty-eight presbyters in their fourfold ministry (in which apostles and elders always rank first), and under these the deacons of the Church Catholic." The priesthood is supported by tithes; it being deemed a duty on the part of all members of the church who receive yearly incomes to offer a tithe of their increase every week, besides the free-will offering for the support of the place of worship, and for the relief of distress. Each local church sends "a tithe of its tithes" to the "Temple," by which the ministers of the Universal Church are supported; by these offerings, too, the needs of poorer churches are supplied, and other expenses connected with the administration of the Church Catholic. From recent statements made by members of this community it appears to be making steady progress. It claims to have among its clergy many of the Roman, Anglican, and other churches, the orders of those ordained by Greek, Roman, and Anglican bishops being recognized by it with the simple confirmation of an "apostolic act."

For further details of doctrines, ritual, &c., see *Restoration of Apostles and Prophets*, by R. N. Bosworth; also his *Readings on the Liturgy*, and *The Church and Tabernacle*.

CATILINA, LUCIUS SERGIUS, a member of an ancient patrician family of Rome, first appears in history during the proscription of Sulla, conspicuous among the ruthless band of murderers, slaying his inoffensive brother-in-law with his own hand, and torturing and mutilating the much-loved Gratidianus. His foul vices were unconcealed; he was believed to have made away with his wife and his son to win the profligate and wealthy Aurelia Orestilla; it was even suspected that he had been guilty of an intrigue with the Vestal Fabia. Nevertheless, in 66 B.C., he found himself qualified for the consulship, and only incapacitated by the impeachment brought against him by P. Clodius Pulcher for extortion during his government in Africa. Catiline would not brook even delay in his

advance to power, and accordingly he formed a conspiracy, in which Autronius, Piso, and even, according to rumour, Crassus and Caesar were concerned. The new consuls were to be murdered while offering up their vows on the 1st of January; and the fasces were to be seized by Catiline and Autronius. The plot failed, but only because the signal was given too hastily; and the discovery brought no punishment upon those implicated, for the intervention of a tribune was readily obtained. Soon after, Catiline, having bribed both judges and accuser, was acquitted in the trial for extortion. His scheme was forthwith immensely widened. The city was to be fired, and those who opposed the revolution were to be slain; all debts were to be cancelled; and there was to be a proscription of all the wealthy citizens. Among the conspirators were many men of the first rank and influence. Arms and money were collected, soldiers were enlisted, and the assistance of the slaves was sought. But Catiline's hopes were again disappointed; once more he failed to obtain the consulship; and, moreover, it soon became apparent that one of the new consuls Cicero, was mysteriously able to thwart all the schemes of the conspirators. He was, in fact, informed of every detail, through Fulvia, the mistress of Curius, one of the plotters, who was himself soon persuaded to turn informer. Before the next *comitia consularia* assembled, the orator had given so impressive a warning of the danger which was impending, that Catiline was once more rejected and the consuls were invested with absolute authority. The other consul, C. Autronius, being absent in Macedonia, Cicero had everything in his own hands. On the 8th of November, he again rose in the senate to make so vigorous an attack upon Catiline that he rushed from the temple, amid the curses of the senators, and fled to the army. Next day Cicero awoke the terror of the people by a second declaration which he delivered in the Forum. Still not one of the rebels deserted, though a free pardon and great rewards were offered to informers,—a remarkable proof, it has been said, of the wretchedness and discontent of the lower orders at that time. It has also, however, been suggested that there existed no conspiracy of a kind concerning which any member of the lower orders could give information. Legal evidence of the plot was, nevertheless, obtained by the means of the Allobrogian ambassadors, implicating Lentulus, Cethegus, and Statilius, who, on the nones of December, were condemned to be strangled by the common executioner in the vile dungeon of the Capitol. This act of speedy vengeance, which was opposed as illegal by Julius Caesar, was strenuously advocated by Cato and, indirectly, by Cicero. Thus a heavy blow was dealt to the cause of Catiline, who, in the beginning of 62 B.C., saw his legions, partially armed and diminished by desertion, shut in between those of Metellus Celer and Antony. Near Fasalæ he hazarded battle with the forces of the latter, commanded by M. Petreius, for the proconsul was or pretended to be ill. So terrible an engagement ensued that the bravest of the victors were slain, and of the conquered not one was taken alive. Catiline's body was found far in advance of his own ranks, amidst a heap of the enemy whom he had slain.

Such is the account of the conspiracy of Catiline, and such is the character of its author, as we find them in the speeches of Cicero, and the histories of Sallust and Dion Cassius. Though there is nothing incredible in either, it must not be forgotten that our sole authorities for these statements were all members of one political party, and that the aristocratical. Some of the incidents given as facts by Dion Cassius are manifest absurdities; and Cicero shared the common habit of ancient orators, and paid more regard to the effect than the truthfulness of an accusation.

We find him at one time admitting that Catiline had almost persuaded him of his honesty and merit, nay, even seeking a political union with him; at another, when his alliance had been rejected and an election was at hand, declaiming against him as a murderer, and as a profligate horribly conspicuous among profligates. And, lastly, though Sallust's vivid narrative is consistent throughout, it is not hard to see that he cherished very bitter feelings against the democratical party. Nevertheless, we have certainly no ground for accepting the view which makes Catiline a worthy successor of the Gracchi, an honest enemy of the hateful oligarchy, and a disinterested champion of the provincials. The following is probably as accurate a statement of the case as can now be given. There was at the time on the part of many of the Roman nobles a determination to raise themselves to power, despite the opposition of the senate, while the bolder among them were quite prepared to resort to force, if that appeared likely to be for their advantage. When, therefore, the senatorial party successfully assumed the aggressive, and its leader, Cicero, ventured on the bold course which we have described, they at once took up arms. Among them Catiline stands out conspicuous, and receives all the attacks of their enemies. Whether he was morally worse than the rest we cannot say with confidence; it was enough that he was far the foremost in force of body and of mind.

CATLIN, GEORGE (1796–1872), a writer on the North American Indians, was born at Wilkesbarre, Luzerne Co., Pennsylvania, in 1796. He was brought up to the law, and practised that profession in Philadelphia for two years; but art was his favourite pursuit, and forsaking the law he established himself at New York as a portrait painter. In 1832, his attention having been called to the fact that the pure American race was disappearing before the march of civilization, he resolved to rescue from oblivion the types and customs of this singular people. With this object in view he spent many years among the Indians in North and South America. He lived with them, acquired their languages, and studied very thoroughly their habits, customs, and mode of life, making copious notes and many studies for paintings. In 1840 he came to Europe with his collection of paintings; and in the following year he published at London a work on the *Manners, Customs, and Condition of the North American Indians* in two volumes, illustrated with 300 engravings. In 1844 he published *The North American Portfolio*, containing 25 plates of hunting scenes and amusements in the Rocky Mountains and the prairies of America. This was followed in 1848 by *Eight Years' Travels and Residence in Europe*, in which Catlin narrates the adventures of three different parties of American Indians, whom he had introduced to the courts of England, France, and Belgium. In 1861 he published a curious little volume, in "manograph," entitled *The Breath of Life*, on the advantage of keeping one's mouth habitually closed, especially during sleep; and in 1868 appeared his *Last Rambles amongst the Indians of the Rocky Mountains and the Andes*. He died in Jersey City, New Jersey, December 22, 1872.

CATMANDOO, the capital of Nepal, in India. See KHATMANDU.

CATO, M. PORCIUS, surnamed *Sapiens*, *Priscus*, *Censorius*, or *Major*, was born at Tusculum in the year 234 B.C. of an ancient plebeian family, noted for some military services, but not ennobled by the discharge of the higher civil offices. This man may be taken as a type of the genuine Roman character at the critical moment when the free state was in its fullest vigour, but was threatened with sudden and rapid decline. His early youth fell in with the period of Hannibal's invasion of Italy. Before he had reached middle age Rome had escaped from imminent

danger of destruction, and had entered upon its career of universal conquest beyond the limits of the Italian peninsula. He was bred, after the manner of his Latin forefathers, to agriculture, to which he devoted himself assiduously when not engaged in military service. But having attracted the notice of L. Valerius Flaccus, a magnate of the city, he was brought to Rome, and became successively quaestor (204), aedile (199), praetor (198), and consul (195). Meanwhile he served in Africa under Scipio, and took part in the crowning campaign of Zama (202). He had a command in Sardinia, where he first showed his strict public morality, and again in Spain, which he reduced to subjection, and gained thereby the honour of a triumph (194). In the year 191 he acted as military tribune in the war against Antiochus, and contributed to the great revolution by which Greece was finally delivered from the encroachments of the East, and subjected to the dominion of the West. From this period the morals and principles of the Romans became fatally affected by their contact with the advanced and corrupt civilization of the Hellenic world. Cato was among the first of his countrymen to perceive the danger, and to denounce it. His character as an able soldier was now well established; and henceforth he preferred to serve the state in the Forum at home. For several years he occupied himself in scrutinizing the conduct of the candidates for public honours, and whenever he seemed to detect in them a decline from the stainless virtue of the olden time, he persistently opposed their claims. He questioned the "pretended battles" of Minucius Thermus, and baffled his demand for a triumph (190); he denounced the "peculation" of Acilius Glabrio, the conqueror of Antiochus (189); he declaimed against Fulvius Nobilior for meanly flattering his soldiers, and for carrying about with him in his campaigns a "frivolous verse-writer," such as Ennius. If he was not personally engaged in the prosecution of the Scipios (Africanus and Asiaticus) for corruption, it was by his spirit that the attack upon them was animated. Africanus, indeed, refused to reply to the charge, saying only, "Romans, this is the day on which I conquered Hannibal," and the citizens absolved him by acclamation; nevertheless, so marked was the blot which Cato had lit in the character of the self-seeking commanders of the time, that Africanus himself found it necessary to retire self-banished to his villa at Liternum.

But Cato was engaged in making head against corruptions more deeply-seated and more widely-prevalent than these. The pride of conquest, the infection of foreign manners, and the dissolution of national ideas and prejudices had made formidable inroads upon the narrow simplicity of the ancient Romans. Both the Etruscans and the Greeks were imbued with a more refined and artificial culture; and with their higher education and enhanced power of persuasion, both these peoples were now exerting a powerful influence upon the minds of their conquerors. Cato conceived it to be his special mission to resist this invasion. It was in the discharge of the censorship that his character as a maintainer of primitive discipline was most strongly exhibited, and hence that he derived the title by which he is most generally distinguished. He revised with unsparing severity the lists of senators and knights, ejecting from either order the men whom he judged unworthy of it, either from their want of the prescribed means, or from notorious crimes or vices. The expulsion of the great emperor L. Quinctius Flaminius was a splendid example of his rigid justice. He regulated with pedantic strictness the expenses of the table, and also of dress and personal ornament, especially of the women. He contended gallantly, but even more ineffectually, against bribery at the public elections; and though he gained little success in the crusades to which

he thus religiously devoted himself, it may be allowed that the example of the great censor did actually raise and maintain a higher spirit of public morality among his contemporaries, and gave encouragement and strength to many struggling consciences even in later generations.

From the date of his censorship (184) to his death in 149, Cato held no public office at home or abroad; but continued to the last to distinguish himself in the senate as the persistent opponent of the new ideas and the men who supported them. He was struck with horror, along with many other Romans of the graver stamp, at the licence of the Bacchanalian mysteries (181), which he attributed to the fatal influence of Grecian manners; and he vehemently urged the dismissal of the sophists who came as ambassadors from Athens. It was not till his eightieth year that he consented to learn even the rudiments of the Greek language. His speeches, of which as many as 150 were collected, were principally directed against the young free-thinking and loose-principled nobles of the day. It is hard to say, was the remark of Livy, whether he attacked them most or they him; for they too did not fail to retaliate, and when he was required to defend himself in his eighty-first year against a capital charge, he was heard to complain of having to plead his cause before men of other minds and of another generation. Almost his last public act was to urge his countrymen to the third Punic war and the destruction of Carthage. Rome, he constantly declared, could never be safe while so great a city lay so near her; and he plucked, on one occasion, from under his robe the fresh figs which, he said, had been gathered but three days before on the coast which fronted the mouth of the Tiber, exclaiming again and again "Delenda est Carthago!"

The great principle of Cato's life was to do everything by rule. With him the individual life was a continual discipline, and public life was the discipline of the many. He regarded the individual householder as the germ of the family, the family as the germ of the state. All his actions were measured, and every one assigned to its proper place and hour; he was a great economist of his time, and thereby enabled himself to get through a great variety of work, though it all lay within narrow limits. He exacted similar application from his dependents, and proved himself a hard husband, a strict father, a severe and cruel master. There was little difference, apparently, in the esteem in which he held his wife and his slaves; his pride alone induced him to take a deeper interest and indulge a warmer feeling in regard to his sons. It may be remarked, however, that among the Romans themselves there was little in this behaviour which seemed worthy of censure; it was respected rather as a traditional example of the old Roman manners. In the remarkable passage in which Livy describes the character of Cato (*Hist.*, xxxix. 40), there is no word of blame for the rigid discipline of his household.

During the course of his long and industrious life, Cato contributed to the formation of the Latin language by at least two important works, the treatise *De Re Rustica*, which is supposed to be at least substantially his own, and the *Origines*, of which last only fragments remain. The one is a miscellaneous collection of rules of good husbandry, conveying much curious information on the domestic habits of the Romans of his age, the other seems to have been a more methodical compilation of Roman history from the foundation of the city to his own time. The fragments which remain of it furnish us with information which is often interesting, but sometimes perplexing, and it is observed that Livy seems to have made no use of the work of which he could not have been ignorant. Of the numerous speeches of Cato but few passages have been preserved. His collection of *Apophthegmata*—he was himself

curt, caustic, and sententious in conversation—is wholly lost.

We possess the life of Cato as written by Cornelius Nepos, Plutarch, and Aurelius Victor. Many particulars of his career and character are to be gathered from Livy and Cicero.

(C. M.)

CATO, M. PORCIUS (commonly distinguished from his great-grandfather, Cato the Censor, by the title of *Uticensis*, from the place of his death and the renown attending upon it), furnishes a remarkable specimen of the effect of Hellenic training upon the hard and narrow but determined spirit of the old Latin race. While he inherited from his illustrious ancestor, and from the general discipline of his family through many generations, a sour and severe temper, a pedantic adherence to form and usage, and an utter lack of sympathy with any temper or habits alien from his own, his feelings had been deepened, if not expanded, by the study of the Greek philosophy. As a devoted follower of the Stoic teaching he had attained to very lofty principles, and made them, with almost undeviating consistency, the rule of his life and conduct. He became a fanatic in the pursuit of holiness and pureness of living, in the highest sense in which such graces could be acquired by a pagan, with a view to himself and his own perfection only, but with no love of man and no faith in Providence. He waged a brave but hopeless war against the evil tendencies of his age; but he attached to himself no party, gave strength to no cause, effected no good in his generation, and at the last critical moment betrayed his trust to humanity by fleeing from immediate evil by an unreflecting suicide. But his aims were, for the times in which he lived, generous and noble, and his career well deserves to be studied by succeeding generations. It is only in a very slight outline that it can be here presented.

Cato was born in the year 95 B.C., and on the death of his parents was brought up in the house of his uncle, Livius Drusus, who was just then beginning to invite the Italians to claim a share in the Roman franchise and its privileges. This was the commencement of the intestine troubles of the Republic, and the whole of Cato's after-life was passed amidst domestic dissensions and civil wars. In his early years he expressed with striking boldness his disgust at the cruelties of Sulla. The priesthood of Apollo, to which he early consecrated himself, commended him to a life of rigid observances, and gave a great impulse to his fervid imagination. He learned the principles of the Stoics under a Greek teacher named Antipater, but his oratory in the Forum represented only the harsh, vehement, and caustic type of his Roman countrymen. After fighting in the ranks against Spartacus he became a military tribune, 67 B.C., and served a campaign in Macedonia. On his return he obtained the quaestorship, and distinguished himself for his zeal and integrity in the management of the public accounts, which recommended him for a provincial appointment in Asia. Again he acquitted himself with marked disinterestedness, and conceived a disgust equal to that of his great ancestor at the corruption of the public men with whom he came in contact. He saw, however, much to admire in the discipline which Lucullus had enforced in his own Eastern command, and he supported his claims to a triumph, while he opposed the inordinate pretensions of Pompeius. When the favour of the nobles gained him the tribuneship he exerted himself to convict Murena, one of their chief men, of bribery. Cicero, more pliant than himself, defended the culprit and obtained his acquittal; but Cicero was glad to avail himself of the firmness and stern justice of his recent adversary, when he urged the execution of Catiline's associates. By this time Cato had become a great power in the state. Though possessed of little wealth and no family influence, his

character for unflinching resolution in the cause of the ancient free state rendered him a valuable instrument in the hands of the nobles, perplexed as they were by the open hostility of Cæsar and the oppressive patronage of Pompeius and Crassus. They were the better disposed, perhaps, to make use of him from the oddity of his unpractical temper, which made it the easier for them occasionally to disclaim and repudiate his assistance. They did not, indeed, find him so complacent a dupe as Cicero, nor did they treat him more faithfully. They thrust him into the snare prepared for him by the triumvirs, and let him be sent on a mission of gross injustice towards the king of Cyprus, which his pedantic loyalty to the state forbade him to refuse. He continued to struggle against the combined powers of the triumvirs in the city, and became involved in scenes of violence and riot, while desperately resisting the superior force of their turbulent adherents. He succeeded, however, in obtaining the prætorship in 54, in which office he strenuously exerted himself in the hopeless and thankless task of suppressing bribery, in which all parties were equally interested. Resolved not to stoop to such practices himself, he failed to attain the consulship; and he had made up his mind to retire from the arena of civic ambition when the civil war broke out in 49.

Cato had now persuaded himself that the sole chance for the free state lay in conceding an actual supremacy to Pompeius. Accordingly he did not scruple to support the unjust measures of the nobles against Cæsar, which gave too fair a colour to the invasion of Italy. Cito was, indeed, little prepared for his commander's flight across the Adriatic, and the surrender of the city, the government, and therewith the ostensible right, to the victorious rebel. Though he followed Pompeius to Epirus he found little satisfaction in his camp, where the fugitives were loudly threatening a bloody vengeance on their enemies. He excused himself from accompanying the forces of the Senate into Thessaly, by which he escaped being present at the battle of Pharsalia. After that great disaster, when his chief had abandoned his party and provided only for himself, he too felt at liberty to separate himself from the main body of the republicans, and conducted a small remnant of their forces into Africa. His march through the deserts of Libya gained him immortal glory. The struggle between the senate and Cæsar was renewed in the African province. Cato shut himself up in Utica, and prepared to defend it as the most important post for communication with Italy. The battle of Thapsus, and the total rout of the senatorial forces, now threw upon him the whole weight of maintaining a cause which had become evidently desperate. The people of the place were anxious to make terms with the victor; but he would not trust the Roman citizens and soldiers to the clemency of the heir of Marius. Hitherto the civil wars of Rome had been continually marked by bloody retaliation; even if Cæsar himself were disposed to mercy he might not be able to restrain the violence of his allies; and it was rumoured that terrible execution had been inflicted upon the captives of the last battle. Accordingly Cato determined to keep the gates closed till he had sent his adherents off by sea. While the embarkation was in progress his own demeanour continued calm and dignified. He supped familiarly with his friends, discoursing with them, as was his wont, on philosophical topics. On being informed that the last of the transports had left the port he cheerfully dismissed his attendants, and soon afterwards stabbed himself on his couch. Assistance was promptly offered, but he refused to avail himself of it, and so perished, much, it may be said, to his own fame, but with little advantage to his country (46 B.C.)

Cato had been reading, we are told, in his last moments

Plato's dialogue on *The Immortality of the Soul*, but it is not likely that the Stoic, with his keen and rigid logic, put much faith in the vague aspirations of the idealist of Academus. His own philosophy had taught him to act upon a narrow sense of immediate duty without regard to future contingencies. He conceived that he was placed in the world to play an active part, marked out by circumstances, and when disabled from carrying out his principles, to retire gravely from it. He had lived for the free state, and it now seemed his duty to perish with it. Cæsar had slain the commonwealth; it never occurred to him that Cæsar himself was mortal, and that the commonwealth might live again. Had he condescended to ask his life, the conquerors would have been proud to grant it; in two years more he might have been the survivor, for he was hardly yet fifty years of age, and might have formed a rallying point for the few devoted spirits, though few indeed they were, who really cared for freedom. Cato has left perhaps, from the circumstances of his life and of his death, the most marked name in the history of Roman philosophy, but he was a student, possibly a dreamer only, composed no works, and bequeathed to posterity no other instruction than that of his example. The memory of his career proved indeed fruitful. The school of the Stoics, which took a leading part in the history of Rome under the earlier emperors, looked to him as its saint and patron. It continued to wage war against the empire, hardly less openly than Cato himself, for two centuries, till at last it became actually seated on the imperial throne in the person of Marcus Aurelius. (C. M.)

CATO, DIONYSIUS, a name concerning which it is doubtful whether it be the name of the author, or merely part of the title, of the *Dionysii Catonis Disticha de Moribus ad Filium*, a small work, consisting of moral apophthegms, chiefly in hexameters. The name usually given is simply Cato, but Dionysius is added on the authority of a MS. declared by Scaliger to be of great antiquity. Other titles by which the book is known are *Cato Moralissimus* and *Cato, Carmen de Moribus*. The latter is also the title of a work by the famous M. Cato the elder; but extracts given from this by Aulus Gellius prove that it was in prose. The authorship of the *Disticha* has been ascribed to a large number of persons, including Seneca and Boetius, but in truth we know nothing of the writer, or of the exact time when it was written. The style is generally pure, and the existence of occasional corruptions argues little against its antiquity, since interpolations have certainly been made, and not improbably emendations attempted. The first mention of the work which we find is in a letter addressed to Valentinian; it is also referred to by Isidorus and Aleuin, and frequently by Chaneer. It appears to have had considerable reputation in the Middle Ages; and at the revival of learning it was studied and highly praised by such men as Scaliger and Erasmus. There have been numerous editions, in MS. and print, of which the best is that of Arntzenius, Amsterdam, 1754. In 1483 a translation was issued from Caxton's press at Westminster.

CATS, JACOB (1577-1660), one of the oldest, and long the most popular, of Dutch poets and humourists, was born at Brouwershaven in Zeeland. Deprived of his mother at an early age, and adopted with his three brothers by an uncle, Cats was sent to school at Zierikzee. At school he was an idle boy, and learned but little; removed, however, to the young and thriving university of Leyden, he seems to have read hard, and to have acquired a respectable knowledge of Greek and jurisprudence. After a visit to France to learn the language, and a turn in Italy with the same object, he returned to Holland, and settled at the Hague, where he began to practise as an advocate. His pleading in defence of a

wretched creature accused of witchcraft got him many clients and some reputation. As Cats so far anticipated the common sense line of argument afterwards adopted in cases of the sort as to be often referred to later as an authority his success was by no means undeserved. A serious love affair occurred about this time, which was broken off on the very eve of marriage by a tertian fever in the bridegroom. The fever defied all attempts at cure for some two years. For medical advice and change of air Cats betook himself to England, where he consulted the highest authorities, and exhausted their pharmacopœia in vain. He resigned himself to his fate, returned to Zeeland to die, and was cured mysteriously by a strolling quack. He then went to Middleburgh, where (1602) he married a lady named Valkenburg, who bore him five children. At Middleburgh he devoted himself to farming and poetry, retiring gradually from the exercise of his profession, and producing his first great works—the *Emblems of Fancy and Love*, the *Galatea* (a pastoral romance), the *Mirror of Past and Present*, the *Marriage*, and others. In 1621, on the expiration of the twelve years' truce with Spain, the breaking of the dykes drove him from his farm. He was made pensionary (stipendiary magistrate) of Middleburgh; and two years afterwards he received the same distinction from the larger city of Dort. His *Nuptial Ring* was the result of his leisure during this part of his career. In 1627 Cats came to England on a mission to Charles I.; that prince made him a knight, but otherwise the poet's success as an ambassador was not indicated by any result. In 1635 he was made grand pensionary of Holland; and in 1652, a year after his resignation of this office, the second in the commonwealth, he again figured in England as an unsuccessful envoy. His long Latin oration left Cromwell absolutely unmoved; and Cats returned to Holland altogether to relinquish the practice of state affairs. In the seclusion of his villa of Sorgvliet (Fly-from-Care), near the Hague, he resided till his death, occupied in the composition of his autobiography (*Eighty-two Years of My Life*) and of many poems (*Old Age and Country Life*, *Coffins for the Living*, &c.) He was buried by torchlight, and with great ceremony, in the Klooster-Kerk at the Hague, and is still spoken of as "Father Cats" by his countrymen.

Cats, who lived and reigned with Hooft and Vondel in the golden age of Flemish literature, was an exceedingly prolific writer. His versification is smooth and regular; although somewhat monotonous; his style is homely and familiar; and the naïveté and simplicity of most of that he says, and of his manner of saying it, are peculiarly attractive. He never soared, or tried to soar; he was content to plod on, scattering round him as he went the blunt straight maxims, the shrewd little moralities, the excellent pieces of advice, which his countrymen—of whose practical and prosaic genius he is the highest literary representative—have found so pleasant and so full of profit. Hardly known outside of Holland, among his own people for nearly two centuries he enjoyed an enormous popularity,—his *Book of Emblems*, a great favourite with Sir Joshua Reynolds in his childhood, being often styled "The Household Bible." Of late years, however, his diffuseness and the antiquated character of his matter and diction have come to be regarded as difficulties in the way of study, and he is perhaps rather more renowned than read. A statue to him was erected at Ghent in 1829.

See Jacob Cats, *Complete Works*, 1790–1800, 19 vols.; Pigott, *Moral Emblems, with Aphorisms, &c., from Jacob Cats*, 1860; and Octave Delepierre, *Sketch of the History of Flemish Literature*, 1860. Southey has a very complimentary reference to Cats in his "Epistle to Allan Cunningham."

CATSKILL or KAATSKIL MOUNTAINS, a group of moderate elevation belonging to the great Appalachian system of North America. They are situated for the most part in Greene County, New York, and are mainly remarkable for the beauty of their scenery and the magnificence of the outlook over the neighbouring country. The principal summits are Round Top, High Peak, and Overlook, which attain a height of nearly 4000 feet. To the north of High Peak is situated the celebrated gorge or "clove" of Catterskill, with its waterfall. The cascades are three in number, and the total height is about 300 feet; but the supply of water is often deficient, and has even to be managed by the hotel proprietors. The place can easily be reached from Mountain House, an hotel which is built at an elevation of 2500 feet, on the front of Pine Orchard Mountain, about 12 miles from the town of Catskill. Another hotel has more recently been erected on the summit of Overlook, at a height of 3800 feet.

CATTACK [CUTTACK], a district of British India, in the province of Orissa, under the jurisdiction of the Lieutenant-Governor of Bengal, in 20° N. lat., and 85° E. long. It is bounded on the N. by the district of Balasor, from which it is separated by the Baitarani and Dhāmra rivers; on the E. by the Bay of Bengal, on the S. by the district of Puri, and on the W. by the Orissa Tributary States. The district comprises the nucleus or middle portion of the great delta formed by the Mahānadi River, and consists of three distinct tracts;—first, a marshy woodland strip along the coast, from 3 to 30 miles in breadth; second, an intermediate stretch of rice-plains; third, a broken hilly region, which forms the western boundary of the district. The marshy strip along the coast, like the Bengal Sundarbans, is covered with swamps and malaria-breeding jungles, but lacks their forest scenery. As one approaches the sea the solid land gives place to a vast network of streams and creeks, whose sluggish waters are constantly depositing silt, and forming morasses or quicksands. Cultivation does not begin till the limits of this dismal region are passed. The intermediate rice plains stretch inland for about 40 miles, and occupy the older part of the delta between the sea-coast strip and the hilly frontier. They are intersected by four large rivers, which dash down from the western mountains, and then split into innumerable branches on the level delta. Their distributaries, after tortuous interlacings, frequently rejoin the parent stream as it approaches the sea. This intermediate tract is a region of rich cultivation, dotted with great banyan trees, thickets of bamboos, exquisite palm foliage, and mango groves. The hilly frontier separates the delta of British Orissa from the semi-independent Tributary States. It consists of a series of ranges, 10 to 15 miles in length, running nearly due east and west, with densely-wooded slopes and lovely valleys between. The timber, however, is small, and is of little value except as fuel. The political character of these three tracts is as distinct as are their natural features. The first and third are still occupied by feudal chiefs, and have never been subjected to a regular land-settlement, by either the Musalmān or the British Government. They pay a light tribute, now permanently fixed. The intermediate rice plains, known as the Mughulbandi, from their having been regularly settled by the Muhammadans, have yielded to the successive dynasties and conquerors of Orissa almost the whole of the revenues derived from the province. The deltaic portions are of course a dead level; and the highest hills within the district in the western or frontier tract do not exceed 2500 feet. They are steep, and covered with jungle, but can be climbed by men. The most interesting of them are the Assa range, with its sandal trees and

The district has an area of 3178 square miles, with a total population of 1,494,784, 95 per cent. of whom, or 1,430,040, are Hindus. The rest consist of Muhamnadans, 40,013; Christians, 2314; and persons of unspecified religion, 22,398. The last comprise the aboriginal tribes, who here, as elsewhere, cling to their mountains and jungles. They chiefly consist of the Bhumij, Tâkâ, Kol, and Savar peoples, the Savars being by far the most numerous, numbering 16,589 souls. They are regarded by the orthodox Hindus as little better than the beasts of the

Weekly steamers ply between Calcutta and Dhámrá. The High Level Canal, when completed, will afford ample means of communication inland towards Bengal. The revenues of the Cattack district have steadily increased under the British rule. The total revenue in 1829-30 was £139,642, the expenditure on civil administration £114,438; in 1870-71 the revenue was £243,958, the civil expenditure £223,659. In the latter year the land revenue amounted to £77,629. Excluding the indigenous village schools maintained by the people themselves, the schools inspected by the Educational Department in 1872-73 numbered 53, attended by 2435 pupils, and maintained at an outlay of £4081, to which Government contributed £2699. The hot season commences in March and lasts till about the middle of June; the rains continue from the middle of June till the end of October, when the cold weather sets in. The average rainfall for five years previous to 1870 was 63·18 inches, the average temperature 84° Fahr. Intermittent fever, elephantiasis, smallpox, and bowel complaints form the prevalent diseases. Cholera is always present among the natives, and occasionally assumes the epidemic type. The district of Cattack, with the rest of Orissa, passed into the hands of the English from the Marhattás in 1803. (M. W. H.)

CATTACK, the most important town in the above district, and the capital of the province, is situated in $20^{\circ} 28' N.$ lat. and $85^{\circ} 55' E.$ long, on the tongue of land where the Mahánadi first bifurcates, throwing off the Kátjuri on its southern and the Birúpá on its northern bank. Cattack city formed one of the five royal strongholds of ancient Orissa, and was founded by a warlike prince who reigned from 953 to 961. Its native kings protected it from the rivers by a masonry embankment several miles long, built of enormous blocks of hewn stone, and in some places 25 feet high. A fortress defended the north-west corner of the town, and was captured by the English from the Marhattás in October 1803. It is now abandoned as a place of defence. The city has long been the commercial and administrative headquarters of Orissa; it is connected with False Point harbour by the Kendrápára Canal. The High Level Canal, at present in course of construction, will open out inland communication between it and Calcutta. In 1825 the town contained 6512 houses, and a population of about 40,000. Population in 1872, 50,378, viz., Hindus, 40,849; Muhammadans, 7436; Christians, 1968; others, 625. (w. w. H.)

CATTARO, the chief town of a circle in the Austrian kingdom of Dalmatia, situated on a narrow ledge between the mountains of Montenegro and the Bocca di Cattaro, a winding and beautiful inlet of the Adriatic. It is strongly fortified towards both the sea and land,—towards the sea by the fortress of Castelnuovo, at the mouth of the gulf, and towards land more especially by the Castle of San Giovanui on the heights; the long lines of wall from this castle to the town form a striking feature in the landscape. The town is the seat of a Catholic bishop, and contains a small cathedral, a Catholic collegiate church, and several convents; but the population is largely Slavonic, and the Greek Church is almost on a level with the Latin. The trade is comparatively restricted, and but little advantage is taken of the gulf except for the fisheries. The principal article of export is dried flesh or *castradina*. Population, 3600.

Cattaro is probably to be identified with the Roman *Ascrivum* (or *Askrourion*); but it does not appear under anything like its present name till the 10th century, when it is described by Constantinus Porphyrogenitus as *Dekatera*. In the reign of Basil the Macedonian (867–886) it was captured by the Saracens; but it afterwards maintained itself as a more or less independent republic till 1419, when from fear of the Turks it accepted the protection and dominion of Venice. In the following centuries it was several times besieged by the enemies of Venice; and in 1563 and 1667 it was nearly destroyed by earthquakes. By the peace of Campo-Formio it passed to Austria; but in 1805, by the peace of Presburg, it was assigned to Italy, and in 1810 it united with the French empire. Its restoration to Austria did not take place till 1814. See Tozer, *Highlands of Turkey*, 1869; *Saturday Review*, March 1876.

CATTERMOLE, GEORGE (1800–1868), an English painter, chiefly in water-colours, was born at Dickleburgh, near Diss, Norfolk, in August 1800. At the age of sixteen he began working as an architectural and topographical draughtsman; afterwards he contributed designs to be engraved in the annuals then so fashionable and popular; thence he progressed into water-colour painting, becoming an associate of the Water-Colour Society in 1822, and a full member in 1833. In 1851 he withdrew from active connection with this society, and with the practice of water-colour painting, and took to oil-colouring. His most fertile period was between 1833 and 1851. In 1855, as an exhibitor in the British Fine Art section of the Great Exhibition in Paris (water-colour branch), he received one of the five first-class gold medals awarded to British painters. He also enjoyed professional honours in Amsterdam and in Belgium. He died on the 24th July 1868. Among his leading works are *The Murder of the Bishop of Liège* (15th century), *The Armourer relating the Story of the Sword*, *The Assassination of the Regent Murray by Hamilton of*

Bothwellhaugh, and (in oil) *A Terrible Secret*. He was largely employed by publishers, illustrating the *Waverley Novels* and the *Historical Annual* of his brother the Rev. Richard Cattermole (his scenes from the wars of Cavaliers and Roundheads in this series are among his best engraved works), and many other volumes besides. He is stated to have been “unsettled in his habits, and uncertain in engagements.” Cattermole was a painter of no inconsiderable gifts, and of great facility in picturesque resource; he was defective in solidity of form and texture, and in realism or richness of colour. He excelled in rendering scenes of chivalry, of mediævalism, and generally of the romantic aspects of the past. Indeed, his faculty in this way might almost be compared—though on a considerably lower level, and with less of the spell of originality—to that of Walter Scott. Just as Scott was fading from the region of mediæval romanticism in letters, Cattermole entered upon it in fine art.

CATTI, or **CHATTI**, a powerful and warlike German nation, who, though defeated by Drusus, Germanicus, and other Roman generals, were never wholly subjugated, till in the 4th century they disappeared among the Franks. They inhabited a district extending from the Weser on the E. to the Rhine on the W., and bounded on the S. by the Agri Decumates. They thus occupied about the same position as the modern Hesse—though their territory was more extensive, and included also part of North-Western Bavaria,—and the name *Hesse* is probably the same as *Chatti*. They lived in a communistic society, but possessed several towns, of which the chief was *Mattium*, now Maden.

CATTLE, a term applied to the various races of domesticated animals belonging to the genus *Bos*, known also as Oxen. They have been divided into two primary groups, the humped cattle or zebu (*Bos indicus*) of India and Africa, and the straight-backed cattle (*Bos taurus*), which are common everywhere. By many naturalists these groups have been regarded as mere races of the same species, and it is a well-ascertained fact that the offspring arising from the crossing of the humped and unhumped cattle are completely fertile; but the differences in their osteology, configuration, voice, and habits are such as to leave little doubt of their specific distinctness. Oxen appear to have been among the earliest of domesticated animals, as they undoubtedly were among the most important agents in the growth of early civilization. They are mentioned in the oldest written records of the Hebrew and Hindu peoples, and are figured on Egyptian monuments raised 2000 years before the Christian era; while the remains of domesticated specimens have been found in the Swiss lake-dwellings along with the stone implements and other records of Neolithic man. In infant communities an individual's wealth was measured by the number and size of his herds—Abram, it is said, was rich in cattle;—and oxen for a long period formed, as they still do among many Central African tribes, the favourite medium of exchange between nations. After the introduction of a metal coinage into ancient Greece, the former method of exchange was commemorated by stamping the image of an ox on the new money; while the same custom has left its mark on the languages of Europe, as is seen in the Latin word “pecunia” and the English “pecuniary,” derived from “pecus,” cattle. The value attached to cattle in ancient times is further shown by the Bull figuring among the signs of the zodiac; in its worship by the ancient Egyptians under the title of Apis; in the veneration which has always been paid to it by the Hindus, according to whose sacred legends it was the first animal created by the three divinities who were directed by the supreme Deity to furnish the earth with animated beings; and in the important part it was made to play in Greek and Roman mythology. The Hindus were not allowed to shed the blood of the ox, and the

Egyptians could only do so in sacrificing to their gods. Both Hindus and Jews were forbidden, in their sacred writings, to muzzle it when treading out the corn; and to destroy it wantonly was considered a public crime among the Romans, punishable with exile.

The domestic cattle of Europe, of which there are at least fifteen British, and a considerably larger number of Continental breeds, have been, according to Professors Nilsson and Rüttimeyer, who have specially studied this subject, derived from at least three distinct species or races—*Bos primigenius*, *Bos longifrons*, and *Bos frontosus*. The first of these, the Urus, would seem, from its remains, to have been domesticated among the Swiss lake-dwellers,—abounding then, and down to historic times, in the wild state, throughout the forests of Europe. Cæsar describes it as existing, in his time, in the Hercynian Forest, in size almost as large as an elephant, but with the form and colour of a bull; and it is mentioned by Heberstein so late as the 16th century as still a favourite beast of chase. The name Urus, applied to it by the Romans, is derived from Ur, a root common to the Indo-European languages, and signifying original, primitive; and may be traced in the Thur of Poland, Stier of the Germans, and the Latin Taurus, as also in various names of places, as the Canton of Uri, Thuringian Forest, Turin, and Tours. The Urus was characterized by its flat or slightly concave forehead, its straight occipital-ridge, and the peculiar curvature of its horns. Its immense size may be gathered from the fact that a skull in the British Museum, found near Atholl in Perthshire, measures 1 yard in length, while the span of the horn cores is 3 feet 6 inches. Several breeds of cattle, as the Friesland of the Continent, and the Pembroke of England, are supposed to have sprung from this source; while the so-called wild cattle of Britain (*Bos taurus*, var. *Scoticus*) make the nearest approach, according to Rüttimeyer, of living forms to the Urus. This breed is of a white colour, except the tips of the horns, which are dark, and the ears and muzzle, which are either black or brownish red. Uniformity in colour, however, is secured by the slaughter of all calves which differ from the pure type. British wild cattle now exist only in Cadzow Forest, Chillingham Park, Lyme Park, and Chartley, in all of which they are strictly preserved. The purest bred are those of Chillingham—a park which was in existence in the 13th century. These have red ears with brownish muzzle, and show all the characteristics of wild animals. According to Mr Hindmarsh, who obtained his information from the proprietor, “they hide their young, feed in the night, basking or sleeping during the day; they are fierce when pressed, but, generally speaking, very timorous, moving off on the appearance of any one even at a great distance.” The bulls engage in fierce contest for the leadership of the herd, and the wounded are set upon by the others and killed; thus few bulls attain a great age, and even those, when they grow feeble, are gored to death by their fellows. The white cattle of Cadzow are very similar to those of Chillingham in their habits, but being confined to a narrow area are less wild. They still form a considerable herd, but of late years, it has been stated, they have all become polled. It is probable, as Sir Walter Scott used to maintain, that Cadzow and Chillingham are but the extremities of what, in ruder times, was a continuous forest, and that the white cattle are the remnants of those herds of “*tauri sylvestres*” described by early Scottish writers as abounding in the forests of Caledonia, and to which Scott evidently refers in the following lines:—

“ Mightiest of all the beasts of chase
That roam in woody Caledon,
Crashing the forest in his race,
The mountain bull comes thundering on.”

It is still a matter of controversy whether these wild cattle are the unsubdued, although degenerate, descendants of the mighty Urus, or merely the offspring of a domestic breed run wild, which have reverted somewhat to the ancient type. Their comparatively small size, and their evident tendency to vary in colour, seem to point out the latter as the more probable view. A breed similar to the Chillingham cattle existed in Wales in the 10th century, being white, with red ears; and Welsh chroniclers relate how on one occasion a Prince of Wales demanded, as compensation for certain injuries, 100 white or 150 black cattle, and how also the anger of King John was at one time appeased by a gift of 1400 of the white variety,—showing that the latter were numerous, and sufficiently under control to be collected and conveyed from one part of the country to another, also that they were more highly valued than the black cattle,—in short, that they existed at that time as a domesticated breed. According to Professor Low (*Domesticated Animals of the British Islands*), this Welsh breed existed under domestication, in a comparatively pure state, in Pembrokeshire at the beginning of the present century. As the wild cattle of Britain are prevented, by rigorous selection, from deviating from their present colour, it is impossible to assert that the ancient Urus was mainly white, although Darwin (*Animals and Plants under Domestication*) has brought forward some facts to show that domestic cattle run wild seem to have a slight tendency to revert in that direction. Immense herds of wild oxen in the Ladrone Islands are described in *Anson's Voyages* as “being milk-white, except the ears, which are generally black;” and in the southern districts of the Falkland Islands, where cattle, introduced from La Plata, have run wild for at least a century, they are “white, with their feet, or whole head, or only their ears, black.”

Bos longifrons, according to Nilsson, existed in the wild state in Sweden; but Rüttimeyer holds that there is not sufficient evidence to prove that it ever existed otherwise than domesticated in Central Europe. It seems to have been the most common race of domestic cattle among the ancient lake-dwellers, and several of the existing Swiss breeds are believed to be derived from it. Remains of the same race are found in Britain associated with those of the elephant and rhinoceros, and there is little doubt that Cæsar found large domestic herds of this kind on his arrival in Britain, and that these supplied food to the Roman legions. Professor Owen regards it as the original of our Welsh and Highland cattle. *Bos longifrons* was smaller than the ordinary breeds now existing, and had short horns. Whether it is to be regarded as originally a wild European species, which Neolithic man succeeded in domesticating, or merely as a domestic race introduced by settlers from the East, as many on philological grounds suppose, it has undoubtedly had a very considerable influence in the formation of our existing breeds.

Bos frontosus was somewhat larger than *B. longifrons*, with which it coexisted in certain districts of Scandinavia. Its remains are found chiefly in the lake-dwellings of the Bronze period, although occurring sparingly in those of earlier date. They have also been found in Irish crannoges; and Nilsson regards it as the progenitor of the present mountain cattle of Norway.

The breeds and sub-breeds produced from these ancient races are exceedingly numerous. “In Britain,” says Youatt, “they are almost as various as the soil of the different districts, or the fancies of the breeders.” This variety may in some degree be attributable to their being the descendants, in all probability, of more than one species, to slight differences in the climate and pasturage of different districts, or to the sudden appearance of what Darwin has

termed "spontaneous variations;" but it is beyond doubt mainly due to the long-continued and careful selection of the breeder. The British forms, a detailed account of which will be found under the article AGRICULTURE, vol. i. p. 387, may be conveniently arranged in three classes:—(1.) *Polled Cattle*, an artificial variety which may be produced in any breed by selection; thus the polled cattle of Galloway had small horns so late as the middle of the last century, but by only breeding with bulls of the shortest horns, the grandfather of the present earl of Selkirk succeeded in entirely removing those appendages; (2.) *Short-horned Cattle*, the descendants of *Bos longifrons*, represented in greatest purity by the Welsh and Highland cattle, and probably differing little from the cattle found in Britain from the Polished Stone age to the end of the Roman period; these were afterwards driven with their masters from the open country to the hilly districts, before the Saxon invaders, who probably brought with them (3.) the *Long-horned Cattle*, larger than the preceding, and of a red and white colour, which have given rise to those breeds of cattle that now occupy the less elevated and more fertile tracts of England. Those Saxon cattle may be regarded as representing the *primigenius* type. The long and short horned varieties, however, interbreed freely, so that in many of our breeds the two types are inextricably mixed.

Of Continental forms the Hungarian is conspicuous from its great size, and the extent of its horns, which often measure 5 feet from tip to tip. The cattle of Friesland, Jutland, and Holstein form another large breed, and these, it is said, were introduced by the Goths into Spain, thus becoming the progenitors of the enormous herds of wild cattle which now roam over the Pampas of South America. The latter, it is alleged by Spanish writers, have all sprung from seven cows and a bull brought from Andalusia to the city of Assuncion in Paraguay, about the year 1556. They are widely spread over the plains of that continent, but are most numerous in the temperate districts of Paraguay and La Plata—a fact which bears out the view taken by Darwin, that our oxen are the descendants of species originally inhabiting a temperate climate. Except in greater uniformity of colour, which is dark-reddish brown, the Pampas cattle have deviated but little from the Andalusian type. They roam in great herds in search of pasture, under the leadership of the strongest bulls, and avoid man, who hunts them chiefly for the value of their hides, of which enormous numbers are exported annually from Buenos Ayres. They are, however, readily reclaimed; the wildest herds, according to Professor Low, being often domesticated in a month. These cattle have hitherto been chiefly valued for their hides, and as supplying animal food to the inhabitants, who only use the choicest parts; but lately attempts have been made, and with considerable success, to export the beef in a preserved state to Europe. Although the South American cattle have thus sprung from a single European breed—that continent possessing no indigenous species of taurine *Bovidae*, they have already given rise to many well-marked varieties, as the polled cattle of Paraguay, the hairless breed of Colombia, and that most monstrous of existing breeds, the Natas, two herds of which Darwin saw on the banks of the Plata, and which he describes as "bearing the same relation to other cattle as bull or pug dogs do to other dogs." Cattle have been introduced by the colonists into Australia and New Zealand, where they are now found in immense herds, leading a semi-wild existence on the extensive "runs" of the settlers. The Hottentots and Kaffres possess several valuable breeds, as the Namaqua and Bechwana cattle, the latter with horns which sometimes measure over 13 feet from tip to tip along the curvature. The cattle of those

semi-barbarous South Africans appear to be among the most intelligent of their kind,—certain of them, known as *backleys*, having been trained to watch the flocks, preventing them from straying beyond fixed limits, and protecting them from the attacks of wild beasts and from robbers. They are also trained to fight, and are said to rush into battle with the spirit of a war-horse.

Oxen, especially in Britain, have come to be regarded as dull and stupid animals, but this is only true of such breeds as are reared solely for fattening and killing. The wild cattle of Chillingham, and the semi-wild herds that abound on the plains of South America, show no lack of sagacity in avoiding threatened danger, or in combining to meet a common foe; while the *backley* of the Kaffres shows how susceptible they are of education. Wherever, indeed, the ox is employed as a beast of burden or of draught, and it is so in most countries, its intelligence is scarcely inferior to that of the horse, while it surpasses the latter in docility and in the patient endurance of toil. In the south-west of England the Devonshire cattle are largely employed in husbandry, and the greater attention which has consequently been bestowed upon them has been amply rewarded in the superior docility and intelligence of the breed. Among the Swiss mountains there are herds of cows, whose leaders are adorned with bells, the ringing of which keeps the cattle together, and guides the herdsman to their pasture grounds. The wearing of the bells has come to be regarded as an honourable distinction by the cows, and no punishment is felt so keenly as the loss of them, the culprit giving expression to her sense of degradation by the most piteous lowings.

The period of gestation in the cow is nine months, when she usually produces a single calf; occasionally, however, two are born, and when these are of different sexes, the female is almost invariably barren, and is known as a "frec-martin," that is, a cow frec for fattening, from the Scotch word "mart," signifying a fattened ox.

It is impossible to over-estimate the services rendered by the ox to the human race. Living, it ploughs its owner's land and reaps his harvest, carries his goods or himself, guards his property, and, as has been seen, even fights his battles, while its udders, which under domestication have been enormously enlarged, yield him at all seasons a copious supply of milk. When dead, its flesh forms a chief source of animal food; its bones are ground into manure or turned into numerous articles of use or ornament; its skin is made into leather, its ears and hoofs into glue; its hair is mixed with mortar; and its horns are cut and moulded into spoons and other useful articles.

Humped cattle are found in greatest perfection in India, but they extend eastward to Japan and westward to the African Niger. They differ from the European forms not only in the fleshy protuberance on the shoulders, but in the number of sacral vertebræ, in the character of their voice, which has been described as "grunt-like," and also in their habits; "they seldom," says Mr Blyth, "seek the shade, and never go into the water and there stand knee-deep like the cattle of Europe." They now exist only in the domesticated state, and appear to have been brought under the dominion of man at a very remote period, all the representations of the ox on such ancient sculptures as those in the caves of Elephanta being of the humped or zebu form. There are several breeds of the zebu, the finest occurring in the northern provinces of India, where they are used for riding,—carrying, it is said, a man at the rate of six miles an hour for fifteen hours. White bulls are held peculiarly sacred by the Hindus, and when they have been dedicated to Siva, by the branding of his image upon them, they are thenceforth relieved from all labour. They go without molestation wherever they choose, and

may be seen about Eastern bazaars helping themselves to whatever dainties they prefer from the stalls of the faithful. See *AGRICULTURE*, vol. i. p. 387. (J. GL.)

CATTOLICA, a town of Sicily, in the province of Girgenti, and 15 miles north-west of the town of that name. In the vicinity there are extensive deposits of sulphur and rock salt. Population, 6380.

CATULLUS, C. VALERIUS, one of the most brilliant and original among Latin authors, belongs to the Ciceronian age, and is one of the two poets whose works adorn and illustrate the last years of the Roman republic. Our knowledge of his life is almost entirely derived from his own writings. The few statements concerning him which have been received on external evidence require to be confirmed or corrected by reference to allusions contained in these writings. The most important of these external evidences are the statements of Jerome, in the continuation of the Eusebian *Chronicle*, under the year 87 B.C.: "Gaius Valerius Catullus, scribtor lyrius Veronæ nascitur," and, under 57 B.C.: "Catullus xxx. ætatis anno Romæ moritur." Questions have been raised, and variously answered, in regard to the correctness both of the names assigned to the poet, and of the dates of his birth and death given in these passages. Although he appears to speak of himself in his poems only by the name of Catullus, there is no controversy as to the Gentile name, *Valerius*. Suetonius, in his *Life of Julius Cæsar* (ch. 73), mentions the poet by the names "Valerium Catullum." Other persons who had the cognomen Catullus belonged to the Valerian gens. Among these, the best known is M. Valerius Catullus Messalinus, one of the *Delatores* in the reign of Domitian, and one of the personages introduced in the famous scene at the Alban Villa of the emperor, described in the fourth satire of Juvenal:—

"Et cum mortifero prudens Veiento Catullo."

The testimony of inscriptions shows, further, that this name was common in the native province of Catullus, and belonged to other inhabitants of Verona, besides the poet and his family (Schwabe, *Questiones Catullianæ*, p. 27). Scholars are still divided in opinion as to whether his *prenomen* was *Gaius* or *Quintus*. In the best MSS. the volume is called simply *Catulli Veronensis liber*, and this is the title which his English editor, Prof. Robinson Ellis, adopts. For the name *Gaius* we have the undoubted testimony, not only of Jerome, which rests on the much earlier authority of Suetonius, but also that of Apuleius. In support of the second, a passage is quoted from the *Natural History* of Pliny (xxxvii. 6, 81), where in some editions the *prenomen* Q. is prefixed to the name. The Q. is, however, omitted in the best MSS., and in other passages of the same author the poet is spoken of as "Catullus Veronensis." The mistake is supposed to have arisen from a confusion with Q. Catulus, the colleague of Marius in the Cimbrian War, himself also the author of lyrical poems. The only other ground in favour of adopting the latter name is a conjectural emendation of Scaliger in the 67th poem (line 12), where he changes the *quite* of the MSS. into "Quinte." Though a question on which such eminent scholars as Mommsen, Haupt, L. Müller, and apparently Mr Ellis, take one side, while Schwabe, W. S. Teuffel, and Mr Munro (*Journal of Philology*, iii.) take the other, can scarcely be considered absolutely settled, yet the arguments adduced by Schwabe and Mr Munro for accepting the authority of Jerome and Apuleius seem difficult to answer. A more important question is raised concerning the dates of the poet's birth and death. It is quite certain, from allusions contained in the poems, that the date of his death given by Jerome (57 B.C.) is wrong, and that Catullus survived the second consulship of Pompey (55 B.C.) (cf. lv. 6, exiii. 2), and was present in

August of the following year at the prosecution of Vatinius, by Licinius Calvus (cf. liii.) From the allusion in lii. 3.—

"Per consulatum perierat Vatinius,"

it was assumed, till the appearance in 1862 of Schwabe's *Questiones Catullianæ*, that Catullus must have lived to witness the consulship bestowed on Vatinius in the end of 47 B.C. This consideration induced Lachmann to fix on 77 B.C. instead of 87 B.C. as the date of the poet's birth. It has, however, been shown by Schwabe, and is now generally admitted, that the line "Per consulatum," &c., refers to the fact that Vatinius, after being prætor in 55 B.C., was in the habit of boasting of the certainty of his attaining the consulship, as Cleopatra was in the habit of confirming her most solemn declarations by appealing to her hope of one day administering justice in the Capitol (cf. Haupt, "Questiones Catullianæ," contained in vol. i of his *Opuscula*, 1875). We have thus certain evidence that Catullus lived till the month of August 54 B.C., but there is no allusion in his poems to any event of a later date than the prosecution of Vatinius. Some of the poems (as xxxvii. and lii.) may very probably have been written during his last illness. He seems to have lived just long enough to collect his works together, to dedicate them to Cornelius Nepos, and to see his

"Ipidum novum libellum
Arido modo pumice expolitum."

If he died in 54 B.C. or early in 53 B.C. there must be a further error either in the first or the second of Jerome's statements. Catullus must either have been born later than 87 B.C. or have lived to a greater age than thirty. The difficulty in regard to the first supposition is that it increases the disproportion between the ages of the poet and his mistress Clodia, who must have been born about 94 B.C. But as he was supplanted in her affections by a still younger man, M. Cælius Rufus, who appears for a time to have been equally infatuated by her, and as Cicero in his defence of Cælius describes her as one "quæ etiam aleret adolescentes et parsimoniam patrum suis sumptibus sustentaret" (*Pro M. Cælio*, ch. xvi. 1), this difficulty is not a serious objection to the date. Catullus is described by Ovid, in true keeping with all the characteristics of his poetry, as "hedera juvenilia cinctus Tempora" (*Amor.*, iii. 9, 61); and this description seems more applicable to a man who dies in his thirtieth year than to one who dies three or four years later. Further, the age at which a man dies is more likely to be accurately remembered than the particular date either of his death or of his birth. The common practice of recording the ages of the deceased in sepulchral inscriptions must have rendered a mistake less likely to occur in that respect, than in respect of the consulship in which he was born. Other instances can be given of the carelessness of Jerome in respect to dates, and Mr Munro gives a probable explanation of the mistake in the confusion between the first and the last of the four consulships of Cinna.¹ It seems, therefore, on the whole most likely that the words "xxx. ætatis anno" are correct, and that Catullus was born in 84 B.C., in the consulship of Cn. Papirius Carbo II. and L. Cornelius Cinna IV.

The statement that he was born at Verona is confirmed by passages in Ovid and Martial. Pliny the elder, who was born at Como, speaks of Catullus in the preface to his *Natural History*, as his "countryman" (conterraneus), and the poet speaks of Verona as his home, or at least his temporary residence, in more than one place (lxvii. 34, lxviii. 27, xxxv. 3); and in mentioning the Transpadani

¹ This is also suggested as possible by Schwabe, who, however, prefers adhering to the date 87 B.C.

among the other inhabitants of Italy, he adds the words "ut meos quoque attingam" (xxxviii. 13).

His occasional residence in his native place is further attested by the statement of Suetonius (*Julius Cæsar*, 73), that "Julius Cæsar accepted the poet's apology for his scurrilous verses upon him, invited him to dine with him on the same day, and continued his intimacy with his father as before." As this incident could only have happened during the time that Julius Cæsar was Proconsul, the scene of it must have been in the Cisalpine province, and at the house of the poet's father, in or near Verona. The verses apologized for were those contained in poems xxix. and lvii., the former of which must have been written after Cæsar's invasion of Britain, so that this interview probably took place in the winter of 55-54 B.C. The fact that his father was the host of the great proconsul, and lived on terms of intimacy with him, justifies the inference, that he was, in wealth and rank, one of the principal men of the province, an inference confirmed by the social position which Catullus himself assumed in Rome, and by his enjoyment of property independent of his father (cf. poems xxxi. and xlv.) during his father's lifetime. The only other important statement concerning the poet's life which rests on external authority is that of Apuleius, that the real name of the Lesbia of the poems was Clodia. One other statement, not concerning the poet's life, but concerning the reputation which he enjoyed after his death, is given in the *Life of Atticus* by Cornelius Nepos (12, 4). It is to the effect that he regarded Lucretius and Catullus as the two greatest poets of his own time.

The volume of poems which Catullus collected and published before his death consists of 116 pieces, varying in length from 2 to 408 lines, the great mass of them being, however, short pieces, written in some lyric or iambic, or in elegiac metre. These poems are not arranged either in chronological order or in accordance with the character of the topics with which they deal. The only principle which seems to have guided the author in his arrangement was that of placing the longer poems, of a less personal and fugitive character, in the middle of the volume, while the first part contained those written in lyric or iambic metres, and the latter part consisted entirely of verses written in the elegiac metre. Many of the last treat of the same topics and refer to the same persons as those forming the subject of the short poems at the beginning of the volume. The elegiac, as well as the phalæcian and iambic metres, were employed by him as the vehicle both of his tenderest and his bitterest feelings. Though no chronological order is observed, yet internal evidence enables us to determine the occasions on which many of the poems were written, and the order in which they followed one another. They give a very vivid image of various phases of the poet's life, and of the strong feelings with which persons and things affected him. They throw much light also on the social life of Rome and of the provincial towns of Italy in the years preceding the outbreak of the second civil war. Apart from their poetic charm, they thus possess the interest of bringing vividly before us some aspects of one of the most critical epochs in the history of the ancient world. In this respect they may be compared with the letters of Cicero, which record the impression produced by the same time on a man of similar susceptibility of feeling and keenness of apprehension, but of character and pursuits as far removed as possible from those of the provincial poet, who modestly contrasts the greatness of the "most eloquent of the descendants of Romulus" with his own humble pretensions.

The poems extend over a period of seven or eight years, from 61 or 62 till 54 B.C. Among the earliest are those

which record the various stages of the author's passion for Lesbia. It is in connection with this passion that he is generally mentioned, or alluded to, by the later Roman poets, such as Propertius, Ovid, Juvenal, and Martial. The real name of Lesbia, as we learn from Apuleius, was Clodia. The admiration which Catullus felt for the great Lesbian poetess, which is clearly indicated by the imitation of her language in his 51st and 62d poems, affords an obvious explanation of the Greek name which he gave to his Roman mistress. After the exhaustive examination of the subject by Schwabe, it may be regarded as certain that she was the notorious sister of Publius Clodius Pulcher, the *βωδπις* who plays an important part in the drama of Cicero's fortunes, brought before us in the first three books of the *Letters to Atticus*,—the "Palatina Medea," whose character stands out so prominently in the speech *Pro Cælio*,—the "quadrantaria Clytemnestra," as she was called by her lover Cælius (*Quintilian*, viii. 6, 23), in reference to the suspicion she incurred of having poisoned her husband, Q. Metellus Celer (consul, 60 B.C.) in 59 B.C. (cf. Munro, *Journal of Philology*, iii.) In the year 56 she charged M. Cælius Rufus, after tiring of him, as she had of Catullus, with an attempt to poison her. It was in defence of him that Cicero described the spell she exercised over young men, in language which might have been applied to her previous relations with the youthful poet, as well as those with the youthful orator and politician.

It may probably have been on hearing of this defence, that Catullus, whose feelings had by that time changed from passionate devotion to scornful animosity, wrote the short poem (xlviii.) *Disertissime Romuli nepotum*, which associates his name with the great orator of the age. Poems concerning Lesbia occur both among the earliest and the latest of those contained in the series. They record the various stages of passion through which Catullus passed, from absolute devotion and a secure sense of returned affection, through the various conditions of distrust and jealousy, attempts at renunciation, and short-lived "amoris integrationes," through the "odi et amo" state, and the later state of savage indignation against both Lesbia and his rivals, and especially against Cælius Rufus, till he finally attained, not without much suffering and loss, the last state of scornful indifference. Among the earliest of the poems connected with Lesbia, and among those written in the happiest vein, are ii. and iii. (*Passer, deliciae meae puellæ* and *Lugete, O Veneres Cupidinesque*), and v. and vii. The 8th, *Miser Catulle, desinas ineptire*, perhaps the most beautiful of them all, expresses the first awakening of the poet to a sense of her unworthiness, before the gentler have given place to the fiercer feelings of his nature. His final renunciation is sent in a poem written after his return from the East, with a union of imaginative and scornful power, to his two butts, Furius and Aurelius (xi., *Furi et Aureli, comites Catulli*), who, to judge by the way Catullus writes of them, appear to have been hangers on upon him, who repaid the pecuniary and other favours they received by giving him grounds for jealousy, and making imputations on his character (cf. xv., xvi., xviii., xxiii.)

The intrigue of Cælius Rufus with Lesbia began in 59 or 58 B.C. (cf. Schwabe, *Quest. Catulli*, p. 66). It was probably in the earlier stages of this liaison that the 68th poem was written, from which it appears that Catullus, at the time living at Verona, and grieving for the recent death of his brother in the Troad, had heard of Lesbia's infidelity, and, in consideration of her previous faithlessness in his favour, was not inclined to resent it very warmly—

"Rara verecundæ furta feremus heræ,"

Two other poems in the series express the grief which Catullus felt for the death of his brother—one, the 65th.

composed at the same time as the 68th, and addressed to the orator Hortensius, who is there, as in some of Cicero's letters, called Hortalus or Ortalus, and sent to him along with the *Coma Berenices* (lxvi.), a translation of a famous elegy of Callimachus. The other poem referring to this event (ci.) must have been composed some years later, probably in 56 B.C., when Catullus visited his brother's tomb in the Troad, on his return from Bithynia. Between 59 and 57 B.C. most of the lampoons on Lesbia and her numerous lovers must have been written (e.g., xxxvii., xxxix., lxix., lxxii., lxxvii., lxxix., xc., &c.) Some, too, of the poems expressive of his more tender feelings to her, such as viii. and lxxvi.,

"Miser Catulle, desinas ineptire,"

and

"Siqua recordanti benefacta priora voluptas,"

belong also to these years; and among the poems written either during this period or perhaps in the early and happier years of his liaison, some of the most charming of his shorter pieces, expressing the affection for his young friends Veranius and Fabullus (ix., xii., xiii.), may be included.

In the year 57 the routine of his life was for a short time broken, by his accompanying the Proprætor, C. Memmius, the friend to whom Lucretius dedicates his great poem, as one of his staff, to the province of Bithynia. The desire of seeing foreign lands, which was as strong a passion among cultivated Romans as among cultivated Englishmen of the present day, was probably the chief inducement to this temporary change of life, especially as Catullus had the prospect of gratifying this passion in congenial society; for the testimony of Cicero as well as of Lucretius shows that Memmius, whatever else he was, was a man of some accomplishment in literature and poetry; and among his younger companions, in the prætor's train, was his friend and brother-poet Helvius Cinna (cf. x.) Some expressions in x., written shortly after his return, imply that he had some hopes of bettering his fortunes by this absence from Rome, as humorous complaints of poverty and debt (xiii., xxvi.) show that his ordinary means were insufficient for his mode of life. He frankly acknowledges the disappointment of these hopes, and still more frankly his disgust with his chief (x., xxviii.) Some of the most charming and perfect among the shorter poems express the delight with which the poet changed the dullness and sultry climate of the province for the freedom and keen enjoyment of his voyage home in his yacht, built for him at Amastris on the Euxine, and for the beauty and peace of his villa on the shores of Lake Benacus, which welcomed him home "wearied with foreign travel." To this period and to his first return to Rome after his visit to his native district belong the poems xlvi., ci., iv., xxxi., and x., all showing by their freshness of feeling and vivid truth of expression the gain which the poet's nature derived from his temporary escape from the passions, distractions, and animosities of Roman society. This happier vein is not to be traced in many of the poems which can be assigned to the years intervening between this time and the poet's death. Two poems, written in a very genial and joyous spirit, and addressed to his younger friend Licinius Calvus (xiv. and l.), who is ranked as second only to himself among the lyrical poets of the age, and whose youthful promise pointed him out as likely to become one of the greatest of Roman orators, may, indeed, with most probability be assigned to these later years (xiv.) From the expression "Odissem te odio Vatiniano," in the third line of xiv., it may be inferred almost with certainty that the poem was written not earlier than December (the "Saturnalia") of the year 56 B.C., as it was early in that year, as we learn from a letter of Cicero to his brother

Quintus (ii. 4, 1), that Calvus first announced his intention of prosecuting Vatinius. The short poem numbered liii. records an incident in connection with the actual prosecution which occurred in August 54 B.C. The poems which have left the greatest stain on the fame of Catullus—those "referta contumeliis Cæsaris," the licentious abuse of Mamurra, and probably some of those personal scurrilities addressed to women as well as men, or too frank confessions, which posterity would willingly have let die—were written in the last years of his life, under the influence of the bitterness and recklessness induced by his experience. The complaint expressed in poem xxxviii.—

"Male est, Cornifici, tuo Catullo,"

and one or two other short poems such as lii.—

"Quid est, Catulle? quid moraris emori?"

appear to be expressive of his state of mind in his last illness. In the first of them we recognize the tender trustfulness, in the last the "sæva indignatio" of his temperament. There is a return of the old graciousness and playfulness of his nature in the dedication to Cornelius Nepos (i.)—

"Quoi dono lepidum novum libellum,"

which must have been written immediately before the publication of his volume.

Of several of the more interesting among the minor poems, as, for instance, xvii., xxxiv., and xlv., we have no means of determining the date. Nor can it be determined with certainty whether the longer and more artistic pieces, which occupy the middle of the volume—the *Epithalamium* in celebration of the marriage of Manlius Torquatus; the 62d poem, written in imitation of the *Epithalamia* of Sappho "Vesper adest: iuvenes, consurgite;" the *Attis*, and the *Epic Idyll* representing the marriage festival of Peleus and Thetis—belong to the earlier or the later period of the poet's career. If the conjecture of Schwabe and other commentators is correct, that the person addressed in the first part of the 68th is the Manlius of the *Epithalamium*, and that the lines from 3 to 8—

"Naufragum ut cecidit . . . pervigilat,"

refer to the death of Junia, it would follow that the first *Epithalamium* was written some time before that poem, and thus belongs to the earlier time. We should be inclined to attach as much weight to the consideration that the ringing, cheerful notes of the poem proclaimed it to be the utterance of the unclouded dawn of his genius, before his nature was saddened and embittered by the two great griefs of his life—the faithlessness of his mistress and the death of his brother. The fact that the translation of Sappho,—

"Ille mi par esse deo videtur,"

and the translation from Callimachus (lxvi.),—

"Omnia qui magni dispexit lumina mundi,"

belong to the earlier period might afford grounds for conjecturing that the other poems not relating to personal topics, and written after the manner of Sappho or the Alexandrine poets, belonged to the same period. But the *Attis* and the *Peleus and Thetis*, although perhaps suggested by the treatment of the same or similar subjects in Greek authors, are executed with such power and originality as declare them to be products of the most vigorous stage in the development of the poet's genius. That his genius came soon to maturity and did not need the ripening process of time and experience through which Horace attained to the perfection of his art, is a reason for hesitation in assigning any particular time between 62 and 54 B.C. for the composition of the *Attis* and of that part of the *Epithalamium* ("Poliaco quondam prognata vertice

pinus") which deals with the main subject of the poem. But the criticism of Mr Munro in his edition of Lucretius, which shows similarities of expression, which cannot be mere casual coincidences, between the Ariadne-episode in the *Epithalamium* of Catullus (from line 52 to 266) and the poem of Lucretius, leaves little doubt that that portion at least of the poem was written after the publication of the *De rerum natura*, in the winter of 55-54 B.C. There is no reason for supposing that Catullus could have had any access to that poem in the lifetime of Lucretius, and even if he were personally known to him and had been acquainted with his poem before its publication, the liberty which ancient poets assumed of using the thoughts and language of previous or contemporary writers could not have included the right of appropriating them before they saw the light.

No ancient author has left a more vivid impression of himself on his writings than Catullus. Neither the *Letters to Atticus* of Cicero nor the *Satires* and *Epistles* of Horace afford more trustworthy indications of feeling and character. The interests which occupied his life and inspired his poetry were limited to the passions and the purer pleasures of youth, such as friendly intercourse with men of congenial and cultivated tastes, the enjoyment of outward nature and foreign travel, the cultivation of his art, and the study of the early Greek lyric and the later Alexandrine poets. Coming to Rome in early youth from a distant province, not at that time included within the limits of Italy, he lived as an equal with the men of his time of most intellectual activity and refinement, as well as of highest social and political eminence. Among those to whom his poems are addressed we find the names of Hortensius, Cicero, and Cornelius Nepos, attesting the fact that his society was valued by older men of established reputation and graver pursuits. With Memmius he was at least on sufficiently intimate relations to form one of the members of his staff during the time of his provincial government. He lived on terms of affectionate friendship with Licinius Calvus, with Helvius Cinna, whose distinction (whatever his real merits as a poet may have been) is attested in Virgil's line—

"Nam neque adhuc Vario videor, nec dicere Cinna
Digna,"

with Varus, in all probability the Quintilius Varus whose death Horace laments to Virgil in the 24th ode of the first book, and other poets and men of letters contemporary with him. It is interesting to notice among those mentioned as belonging to the circle of his younger friends, one who lived to become one of the most eminent men as statesman, orator, and man of letters in the following generation, Asinius Pollio, characterized by Catullus as—

"leporum
"Disertus puer et facetiarum."—xii. 8.

Catullus brought into this circle the genius of a great poet, the social vivacity of a vigorous nature, the simplicity and sincerity of an unambitious, and the warmth of an affectionate disposition. He betrays all the sensitiveness of the poetic temperament, but it is never the sensitiveness of vanity, for he is characterized by the modesty rather than the self-confidence which accompanies genius, but the sensitiveness of a heart which gives and expects more sympathy and loyalty in friendship than the world either wants or cares to give in return. He shows also in some of his lighter pieces the fastidiousness of a refined taste, intolerant of all boorishness, pedantry, affectation, and sordid ways of life. The passionate intensity of his temperament displays itself with similar strength in the outpourings of his animosity as of his love and affection. It was, unfortunately, the fashion of the time to employ in

the expression of these animosities a licence of speech and of imputation which it is difficult for men living under different social conditions to understand, still more difficult to tolerate. Cicero, in reference to such imputations says, in his defence of Caelius (ch. iii.)—"Sunt ista maledicta pervulgata in omnes, quorum in adolescentia forma et species fuit liberalis;" and a few sentences later he says of this kind of *maledictio*, "si petulantius iactatur, convicium, si facetius, urbanitas nominatur." It is not easy to realize what the style of those scurrilities must have been, which were "more petulant" and "less urbane" than those of Catullus. But the language of Cicero implies that they were taken, and meant to be taken, merely as a *façon de parler*, and would not be regarded either by the objects of them or by those who read them as conveying the serious belief of the writer. Mr Munro (*Journal of Philology*, iii.) has examined the 29th poem—

"Quis hoc potest videre, quis potest pati,"

the longest and most important of the lampoons on Cæsar and Mamurra, and has shown with much learning and acuteness the motives and intention of Catullus in writing them. Had Julius Cæsar really believed, as Suetonius writing two hundred years afterwards says he did, that "an eternal stigma had been cast upon him by the verses concerning Mamurra," we should scarcely apply the word magnanimity to his condonation of the offence. But these verses survive as a memorial not of any scandal affecting Julius Cæsar which could possibly have been believed by his contemporaries, but of the licence of speech which was one of the symptoms of the social and political disorganization of the age, of the jealousy with which the younger members of the Roman aristocracy, who a little later fought on the side of Pompey, at that time regarded the ascendancy both of the "father-in-law and the son-in-law," and the social elevation of some of their instruments, and also, to a certain extent, of the deterioration which the frank and generous nature of Catullus underwent from the passions which wasted and the faithlessness which marred his life.

The great age of Latin poetry extends from about the year 60 B.C. till the death of Ovid in 17 A.D. There are three marked divisions in this period, each with a distinct character of its own: the first represented by Lucretius and Catullus, the second by Virgil and Horace, the last by Ovid. Force and sincerity are the great characteristics of the first period, maturity of art of the second, facility of the last. The educating influence of Greek art on the Roman mind was first fully experienced in the Ciceronian age, and none of his contemporaries was so susceptible of that influence as Catullus. With the susceptibility to art he combined a large share of the vigorous and genial qualities of the Italian race. Like most of his younger contemporaries, the νεώτεροι of whom Cicero speaks (*Epist. ad Atticum*, vii. 2), he studied in the school of the Alexandrine poets, with whom the favourite subjects of art were the passion of love, and stories from the Greek mythology, which admitted of being treated in a spirit similar to that in which they celebrated their own experiences. It was under this influence that Catullus wrote the *Coma Berenices*, the 68th poem, which, after the manner of the Alexandrines, interweaves the old tale of Proteus and Laodamia with the personal experiences of the poet himself, and the *Epithalamium* of Peleus and Thetis, which combines two pictures from the Greek mythology, one of the secure happiness of marriage, the other of the passionate despair of love betrayed. In this last poem Catullus exercises a power of creative pictorial imagination far transcending that displayed in any of the extant poetry of Alexandria. We have no means of determining what suggested the subject of the *Attis* to Catullus,

whether the previous treatment of the subject by some Greek writer, some survival of the myth which he found still existing during his residence among the "Phrygii Campi," or the growth of various forms of Eastern superstition and fanaticism, at Rome, in the last age of the Republic. Whatever may have been its origin, it is the finest specimen we possess, in either Greek or Latin literature, of that kind of short poem more common in modern than ancient times, in which some situation or passion entirely alien to the writer, and to his own age, is realized with dramatic intensity. But the genius of Catullus is, perhaps, even happier in the direct expression of personal feeling than in artistic creation, or the reproduction of tales and situations from mythology. The warmth, intensity, and sincerity of his own nature are the sources of the inspiration in these poems. The most elaborate and one of the finest of them is the *Epithalamium* in honour of the marriage of a member of the old house of Manlius Torquatus with Junia (or, according to another reading, Vinia) Aurunculeia, written in the glyconic in combination with the pherecratean metre. To this metre Catullus imparts a peculiar lightness and grace by making the trochee, instead of the spondee as in Horace's glyconics and pherecrateans, the first foot in the line. His elegiac metre is constructed with less smoothness and regularity than that of Ovid and Tibullus or even of Propertius, but as employed by him it gives a true echo to the serious and plaintive feelings of some of his poems, e.g., lxxvi.—

"Si qua recordanti benefacta priora voluptas,"

xvii.,

"Si quiequam mutis gratum acceptumque sepulchris,"

and ci.,

"Multas per gentes et multa per aequora vetus,"

while it adapts itself, as it did later in the hands of Martial, to the epigrammatic terseness of his invective. But the perfection of the art of Catullus is seen in his employment of those metres which he adapted to the Latin tongue from the earlier poets of Greece, the pure iambic trimeter, as in iv.—

"Phaselus ille quem videtis hospites,"

the Scæzon iambic, employed in viii. and xxxi.—

"Pænisularum, Sirmio, insularumque,"

and the phæcian hendecasyllabic, a slight modification of the Sapphic line, which is his favourite metre for the expression of his more joyful moods, and of his lighter satiric vein. The Latin language never flowed with such ease, freshness, and purity as in these poems. Their perfection consists in the entire absence of all appearance of effort or reflexion, and in the fulness of life and feeling, which gives a lasting interest and charm to the most trivial incident of the passing hour. In reference to these poems Mr Munro has said with truth and force: "A generation had yet to pass before the heroic attained to its perfection; while he (Catullus) had already produced glyconics, phæcians, and iambics, each 'one entire and perfect chrysolite,' 'cunningest patterns' of excellence, such as Latium never saw before or after,—Alcæus, Sappho, and the rest then and only then having met their match" (*Journal of Philology*, No. iii.)

From expressions in some of the poems (xvi. 12, liv. 7) it is clear that several of them had been published or circulated separately before they were finally collected in the edition which has come down to us. Lines are quoted from Catullus by ancient writers which are not found in any of the poems which we possess. If these passages are correctly attributed to Catullus it follows that he must have omitted some of his earlier poems from the collection which he made before his death. In some of the older editions (as for instance that of Döring, 1834) two poems addressed "ad Hortorum Deum," and numbered 19 and 20, have been included, of which there is no ground to believe Catullus to have been the author. The lines numbered in Döring's edition 18 are attributed to him by an ancient gram-

marian, though they are not included in the MSS. of his collected works. The text, as it has reached us, is in many places corrupt, and its restoration still exercises the acuteness of English and German scholars. There appears to have been one MS. of Catullus extant in France in the 9th century, from which the 62d poem, *Vesper adest, iuvenes, consurgite*, &c., was copied at that time into an anthology of Latin poems. Another MS. is known to have existed in Verona in the middle of the following century. This MS. is not again heard of till the beginning of the 14th century when it was again discovered and read by Petrarch. It was soon after lost again. The two oldest extant MSS. are immediate copies of it. One of these, dated 1375, now belongs to the Paris Library, the other to the Bodleian (*cf.* Bahrens, *Prolegomena*). The *editio princeps* appeared in 1472, and other editions appeared a few years later at Parma and Venice. "In the 16th century Catullus, like most of the chief Latin classics, was corrected and illustrated with signal zeal and success. The editions of Avancius, Guarinus, Muretus, Statius, and Scaliger do honour to the learning of Italy and France, even in that age of erudition" (Munro, *Journal of Philology*, iii.) Nothing more was done of any importance, in the way of emendation or commentary, till Laehmann published his edition of the text in 1829. Since that date editions have appeared by Haupt, Roszbach, Schwabe, Müller, Bahrens (1876), and other German editors, and by Professor Robinson Ellis—the last accompanied by an elaborate *apparatus criticus*, *prolegomena*, &c. Most important contributions to the interpretation of the matter and meaning of Catullus have been made by Haupt, Schwabe, and Mr Munro in the *Journal of Philology*. Among recent English translations may be mentioned those of Mr Theodore Martin, Dr Cranston, and Mr R. Ellis—the last being written in the metres of the original poems. (W. Y. S.)

CAUCASIA, a governor-generalship of the Russian empire, which extends from about 38° 40' to 46° 40' N. lat., and includes the whole range of the Caucasus, the vast steppes that lie to the north of the mountains between the Sea of Azoff and the Caspian, and all the Russian territory to the south. On the south side it is bounded by the Turkish empire and Persia, while on the north it is continuous with Astrakhan and the province of the Don army. The principal division is into Cis-Caucasia or the European portion, and Trans-Caucasia or the Asiatic,—the watershed of the Caucasus having recently been adopted as the line of partition. Cis-Caucasia thus includes the government of Stavropol, the Kuban district, the Terek district, and Daghestan; while Trans-Caucasia comprises the governments of Tiflis, Baku, Elisabethpol, Erivan, and Kutai, and the circles of Sukhum, Zakatal, and the Black Sea or Chernomorsk. The total area is 172,837 square miles, and the population is estimated at 4,893,332.

Map of Caucasus and Lieutenantcy of Caucasus (950 miles by 650).

CAUCASUS, a great chain of mountains, extending from the Black Sea to the Caspian. It has a general direction from W.N.W. to E.S.E., which it preserves with great uniformity for so extensive a chain, having a range of nearly 700 English miles in length, from its commencement

near Anapa on the Black Sea, till it sinks into a range of low hills, as it approaches Baku on the Caspian. Its width on the other hand is comparatively small, not exceeding in general about 70 or 80 miles, and even where widest not attaining more than 120 miles.

Few great mountain chains have their boundaries so clearly marked by nature. On the N. it is bounded by the vast plains and steppes of Russia, which extend completely across from the Sea of Azoff to the Caspian, and are carried up to the very foot of the mountain slopes; on the S. it is bounded at first by the Black Sea, for a distance of nearly 240 miles, and afterwards by the broad and level valley of the Rion as far as Kutais, about 70 miles inland. Farther eastward the valley of the Kur may be considered as forming its southern limit from the neighbourhood of Tiflis to the Caspian, a distance of more than 250 miles. But between the towns of Kutais and Tiflis the country is more broken, the underfalls and minor ramifications of the Caucasus extending to the south so as to meet those of the mountain chain which forms the southern boundary of the valley of the Rion. The two ranges are, indeed, united at this point by a transverse range of very moderate elevation, which forms the watershed between the streams that flow into the Black Sea, and the Kur and its tributaries, which flow eastward towards the Caspian. This dividing range (commonly known as the mountains of Suram from the town of that name) may therefore be regarded as constituting a connecting link between the Caucasus and the southern range, which extends from the Black Sea in the neighbourhood of Poti to that of Tiflis, and itself attains to a very considerable elevation, several of its summits having an altitude of from 9000 to 10,000 feet. But these ranges belong to the great mountain group of Armenia, and are inseparably connected with the mountains of Lazistan, and with those which extend inland to join the northern branches of the Taurus; and they cannot with any propriety be regarded as forming part of the system of the Caucasus. The transverse range above described, though forming the watershed between the two basins of the Rion and the Kur, is in itself but an inconsiderable ridge of hills, and the point where it is traversed by the high road between Kutais and Tiflis has an elevation of only about 3000 feet above the sea. Hence the Caucasus may properly be considered as forming an isolated chain, unconnected with any other of the great mountain systems of Asia; while those to the south of it belong in reality to the widespread ramifications of the range known to the ancients as Mount Taurus, which extends from Asia Minor through Armenia into Persia.

It is unfortunate that some modern geographers, especially Germans, have introduced into their systematic treatises the practice—first adopted by the Russian residents in the provinces south of the Caucasus—of designating these southern ranges by the appellation of the Little Caucasus, a term tending to produce confusion, and to encourage the notion of their being connected with the great northern range in a manner which is certainly not the case in any true orographical sense. In the present article the name of the Caucasus will be employed only as applied to the great mountain range which, as has been already stated, forms a continuous barrier from the shores of the Black Sea to those of the Caspian, and to which alone the appellation has been applied from the time of the Greeks to our own day.

The origin of the name is unknown. It was employed by the Greeks in very early times, and has continued in use among geographers ever since. But no general name for the whole chain is known to the tribes that inhabit it, or to those that immediately adjoin it. Nor does it appear that any of the local or native designations of portions of

the mountains known by this name are such as may reasonably be supposed to have given rise to the term.

At the present day the line of the Caucasus is generally regarded as constituting the boundary between Europe and Asia; and though it is only in quite modern times that this line of demarcation has been established among geographers, it is so much the most convenient natural limit that it can hardly fail to continue to be received as such. The scientific conclusion has, moreover, been confirmed of late years by the official sanction of the Russian Government, which has adopted the watershed or central ridge of the Caucasus as the line of separation between its European and Asiatic provinces.

In its general character and conformation the range of the Caucasus may be considered as presenting more analogy with the Pyrenees than with the Alps. Its general uniformity of direction, its comparatively small width, and its well-defined limits towards both the south and the north, are strong features of resemblance to the former, rather than to the latter, of these well-known ranges. To these it may be added that, like the Pyrenees, the ridge of the Caucasus generally preserves for long distances together a high *average* elevation, and is not broken by those deep depressions, constituting natural passes across the chain, which are of such frequent occurrence in the Alps. Another point of resemblance between the Pyrenees and the Caucasus is to be found in the fact that in both cases two of the highest summits are in some measure detached from the main range; and just as the Mont Perdu and the Maladetta both lie south of the central ridge of the Pyrenees, and are consequently distinctly included in Spain, so Mount Elbruz and Kazbek—the two best known summits of the Caucasus—are situated decidedly north of that chain, and must therefore be geographically assigned to Europe, if the line of demarcation be drawn along the watershed of the range. Both these mountains are, in fact, of recent volcanic origin, and, geologically speaking, unconnected with the granitic masses which constitute the central axis of the chain.

It had long been known that the highest summits of the Caucasus exceeded the most lofty of the Alps in positive elevation; but until very recently no accurate measurements of them existed, and little or nothing was known of any of the individual peaks except the two already mentioned. Of these Mount Elbruz owes its celebrity not merely to the fact that it is in reality much the most lofty summit of the whole range, attaining an elevation of not less than 18,526 feet, but to the circumstance that from its partly isolated position, it is conspicuously seen, both from the Black Sea and, on the other side, from the plains and steppes of Russia, where it is said to be distinctly visible from a distance of more than 200 miles. Kazbek, on the contrary, attracted attention from an early period, on account of its proximity to the Pass of Dariel, in all ages the only frequented pass across the range of the Caucasus. Hence it was long supposed to be the second in height of the whole range, which is now found not to be the case, though it attains an elevation of 16,546 feet, or nearly 800 feet higher than Mont Blanc. But between these two giant peaks rise those of Koshtau Tau and Dych Tau (both of the names until very recently quite unknown), of which the former rises to nearly 17,100 feet, while the latter attains to 16,925 feet; these are therefore entitled to rank as the second and third summits of the Caucasus, while Kazbek can claim only the fourth place. It is, indeed, doubtful whether some of the other peaks on the great snowy range do not also exceed it in height.

For the purpose of description it may be convenient to divide the great range into three portions.

1. The first of these, comprising the western portion of

Western.

the mountain chain, begins in the neighbourhood of Anapa on the Black Sea, where it rises at first merely as a chain of hills of moderate height, but gradually assumes more and more of a mountain character, until the highest summits attain to an elevation of 9000 to 10,000 feet. It is not, however, till they approach the neighbourhood of Elbruz that they pass the limit of perpetual snow; but the central chain, from the 41st degree of longitude eastwards, is almost constantly covered with snow, and throughout the greater part of the year exhibits a lofty range of snow-clad peaks, that can find no parallel in Europe, except in the Alps. Throughout this western portion of the Caucasus, the central chain forms a very distinct line of watershed, at no great distance from the Black Sea, but gradually receding from it, and thus leaving a wider interval between its shores and the main ridge. Even at Sukhum Kaleh, however, in longitude 41°, the central chain of the mountains is not more than 30 miles inland in a direct line as measured on the map. The whole of the intermediate space is filled up by the underfalls and subordinate ranges of mountains thrown out from the great chain, extending for the most part quite down to the sea, so as to constitute a coast line of a singularly rugged and inaccessible character. For a distance of nearly 200 miles from Novo Rossisk to Sukhum Kaleh there is nothing like a harbour, while the dense forests with which the mountains are still covered contribute to render the interior impassable.

From the proximity of the central ridge to the sea, in this western portion of the Caucasus, it naturally follows that no rivers of any importance are to be found on the southern slope of the mountains, though it is furrowed by numerous mountain torrents, which add to the impracticable character of this part of the country. On the northern side, on the contrary, the mountains slope more gradually towards the plains of Russia, and here several considerable streams are found, all of which pour their waters into the Kuban, which itself takes its rise in the glaciers of Elbruz. Among the most considerable of these streams may be mentioned the Urap, the Laba, and the Bjelaia.

Central.

2. The great central mass of the Caucasus, extending from the neighbourhood of Elbruz to that of Kazbek, or from the source of the Kuban to the pass of Dariel, a distance of about 130 miles in a direct line, is at once the most important and interesting part of the whole chain, and is that which has of late years been the most fully explored. It is here that are found all the most lofty summits of the whole range. Besides the four above mentioned, there are at least five other peaks in this part of the chain that attain to not less than 15,000 feet, viz., Ginnaran Khokh and Adai Khokh, which, according to the Russian survey, measure respectively 15,672 and 15,214 feet in height, while three others, not found in the survey, are estimated by the practised English mountaineers as follows:—Tungzoran, 15,000 feet; Tau Tütönl or Tetnuld, 15,500; and Uachba (one of the most remarkable mountains in the whole of the Caucasus), not less than 16,500 feet. But it is not merely that isolated summits attain to these great altitudes, but the whole line of the watershed or central ridge, from a point south of Elbruz to the group of Adai Khokh, on the west of the Ardon valley, is an uninterrupted line, which nowhere sinks below 10,000 feet, and is traversed only by glacier passes, some of them extremely rugged and difficult, others comparatively easy, but still presenting an extent of snow and ice equal to that of the well-known pass of St Theodule in the Alps. There is here, therefore, an unbroken mass of glacier and perpetual snow of nearly 100 miles in length, or as far as from Mont Blanc to the St Gotthard. It nowhere, however, attains to any great width, nor do any of the glaciers that descend its flanks equal in extent the largest of those in the Alps. Eastward

of the Adai Khokh group the ridge is intersected by the upper valley of the Ardon, but the range of snowy peaks is continued after this interruption by the lofty summits of Tau Tepli and Ginnaran Khokh on to Kazbek, where the whole chain is deeply cut through by the gorge of Dariel, and the corresponding depression of the pass between Kobi and Mleti. But while the series of peaks just referred to may be considered as the continuation of the true axis of the chain, the watershed, which has for so long a space run nearly from W.N.W. to E.S.E., bends suddenly due south, and sinks to the comparatively low gap of the Mamisson Pass, which is about 9400 feet in height, and entirely free from glacier. After a few miles it resumes its former direction, but without recovering its elevation or grandeur, the peaks of this part of the chain rising only to 11,000 and 12,000 feet, while the passes which traverse it range from about 9000 feet to less than 8000 feet, the elevation of the Krestowaja Gora, where the watershed is traversed by the high road from Vladikavkaz to Tiflis. In this part of the chain, therefore, we have a watershed of comparatively small altitude, with a parallel range to the north of it of much more lofty mountains. The central mass, on the contrary, from Elbruz to Adai Khokh, presents a lofty medial range of granitic structure, on both sides of which, but especially on the south, rise secondary chains of limestone mountains, preserving in a general way parallel courses with that of the main chain. Hence the upper valleys are troughs, bounded on both sides by lofty mountains, through which the upper waters of the streams that take their rise in the glaciers of the central chain are compelled to flow, until they make their escape by deep gorges cut through the lateral ranges. The most important of these parallel trough-like valleys is the upper valley of the Ingur, forming the district known as Suanetia, which is between 40 and 50 miles in length, and will thus bear comparison with the two great valleys of similar structure in the Alps, the Valais and the Valteline.

It may naturally be expected that so great a mass of glaciers and perpetual snow should send forth a number of considerable streams, and in fact all the principal rivers of the Caucasus have their sources in the district now under consideration. Commencing with those on the south side of the chain, which flow towards the Black Sea, we find—(1.) the Kodor, a considerable stream, which enters the sea about 12 miles south of Sukhum Kaleh; (2.) the Ingur, a much more important river, which rises in the great glaciers of the Central Caucasus, near a place called Jibiani, and, after flowing for nearly 50 miles in a course parallel to the great chain (as already described) and receiving in its course the outflows of numerous other glaciers, turns abruptly to the south-west, and after pursuing that direction for above 60 miles, discharges its waters into the Black Sea at the little town of Anaklia; (3.) the Znesquali, which rises in the mountains almost immediately east of the sources of the Ingur, and in like manner flows at first nearly due west, then turns towards the south-west and south, and joins the Rion about 30 miles above its mouth at Poti; and (4.) the Rion itself, the most important of all the Caucasian rivers that flow into the Black Sea. The Rion has a very circuitous course, having its source at the foot of the mountain called Pasi Mta, very near the sources of the Znesquali, and flowing at first in a south-easterly direction, past the little town of Gebi, about 8 miles below which it receives an affluent from the Mamisson Pass towards the north-east; it then turns about south-west till it has passed the village of Oni, after which it flows for a considerable distance (above 30 miles) nearly due west, through one of the parallel valleys above described, and then again turns due south until it has passed under the walls of Kutais, the capital of Imeritia. A few miles.

below that town it emerges from the hills into the broad and level valley that separates the underfalls of the Caucasus from the ranges to the south. It here receives a tributary called the Quirilha, which brings down the waters from the Suram range (the transverse ridge that unites the Caucasus with the mountains of Armenia), and then again turning to the west, pursues a winding course, but retaining the same general direction, till it enters the Black Sea at Poti, about 50 miles in a direct line from its junction with the Quirilha. The Rion is in the lower part of its course a deep and rapid stream, and is navigable for steamers as high as Orpiri, where it receives the Zenesquali, but unfortunately a shallow bar at its mouth prevents the entrance of large steamers from the sea. It is the river so well known in ancient times under the name of *Phasis*, and connected by Greek legends with Medea and the voyage of the Argonauts.

All the streams that take their rise on the southern side of the Central Caucasus, east of the Mamisson Pass, are tributaries of the Kur, and discharge their waters into that river, which itself, however, does not derive its origin from the Caucasus, but flows from the mountains of Armenia, and receives its first Caucasian affluent, the Lachwa, at the town of Gori. The most important of these tributaries is the Aragwa, which has a course almost due north and south, from its source above Mleti to its junction with the Kur at Mscheti. It is up the valley of this river that is carried the highroad from Tiflis to Vladikafkaz, which turns off at Mleti to cross the pass of the Krestowaja Gora, and from the natural facilities afforded by this line of route, it has been from the earliest ages frequented for the same purpose.

The rivers that flow from the Central Caucasus northwards have much longer courses than those on the south side, both from the more gentle slope of the mountains in that direction, and from the extent of the steppes beyond, through which they have afterwards to find their way to the sea. By far the most important of these rivers are the Kuban and the Terek, which receive as tributaries all the minor streams. Of these the Kuban takes its rise in a glacier at the foot of Mount Elbruz, immediately below the watershed of the main chain. It flows at first in a northerly direction, and preserves this course till it has altogether quitted the mountains, and entered the steppe of the Nogai Tartars, when it trends first towards the north-west and then abruptly towards the west, which general direction it pursues till it enters the Sea of Azoff by one mouth and the Black Sea by another. Its whole course is estimated at above 400 miles. During the latter part of its course, from east to west, it receives the waters of all the smaller streams that descend the northern slopes of the Western Caucasus. The Terek has its source in the central chain, where it issues from a small glacier at the foot of Zilga Khokh, its head waters being separated from those of the Ardon only by a pass of moderate elevation. Its upper valley, like so many others, has a direction parallel to the main range, so that it is compelled to flow towards the south-east as far as the village of Kobi, where it turns to the north-east, which direction it holds to the village of Kazbek, and from thence pursues a course almost due north, traversing the famous ravine or gorge of Dariel, until it finally issues from the mountains at Vladikafkaz. From thence it takes a north-westerly direction, which it follows for a distance of more than 70 miles, receiving on its way numerous affluents, the last of which is the Malka, after its junction with which, near the town of Jekaterinograd, it turns abruptly to the east and pursues its course in that direction through a tract of steppes and marshes for 200 miles to its mouth in the Caspian Sea. All the mountain streams that flow northwards from the great glaciers of the

central chain, between the Kuban and the Terek, discharge their waters into the latter river. The most important of these are (proceeding from west to east) the Malka, the Baksan, the Tchegen, the Tcherek, the Uruch, and the Ardon,—all of them large and rapid streams, which flow through deep valleys in a generally northerly direction, until they emerge from the mountains, and successively unite their waters with those of the Terek. The Kuma alone pursues an independent course through the steppes to the north of the Terek, but this stream does not rise in the central chain of the Caucasus, but has its sources in the detached and outlying group of mountains near Pjätigorsk—the highest summit of which, the Beschtai, does not attain to a height of more than 4600 feet. Hence its waters, not being fed by perennial snows, are absorbed in the sands of the steppe before they reach the Caspian.

3. The Eastern Caucasus may be considered as comprising the whole of the main chain from the Pass of Dariel to the Caspian, together with its various ramifications, which are considerably more extensive than in the other portions of the range. It is at once the most complicated and the least known part of the whole, the highest portions not having yet been explored by any of those adventurous travellers who have added so much to our knowledge of the Central Caucasus. But it is certain that, while none of the summits in this part of the range equal those further west—the highest of them not attaining to 15,000 feet—there is nevertheless a long succession of snowy peaks, rising to a height of from 10,000 to 14,000 feet, which extends from the Pass of Dariel as far as Baba Dag, in 48° E. long., the last of these lofty summits proceeding eastwards towards the Caspian. At the same time there is no great connected mass of glacier similar to that found in the Central Caucasus; indeed no considerable glaciers exist in this part of the range at all. The watershed is, however, continued at a high elevation (after passing the depression traversed by the pass of the Krestowaja Gora) as far as Mount Schebulos, from whence it sends out a considerable branch towards the north-east, known as the Andi Mountains, from the village and valley of that name, which forms the northern boundary of Daghestan, and separates it from Tschechnia, or the country of the Tchetchens. The main range retains its general direction with little variation, from about north-west to south-east, and still presents many peaks of considerable elevation, the highest summits being Sari Dag at the head of the River Samur, which attains to 12,000 feet, and Schach Dag (called also Bazardjusi) which rises to 13,950 feet. The last of these lofty peaks is Baba Dag (11,934 feet), from which the main chain descends gradually as it approaches the Caspian, and sinks into hills of moderate elevation before reaching the shores of that sea at Baku. The Peninsula of Apsheron, which here forms a promontory projecting into the Caspian, may be considered as forming the last faint prolongation of the Caucasian chain.

But while the axis forming the main watershed of the range thus preserves a pretty regular course, it throws off towards the north and north-east a number of offshoots, filling up the greater part of the space between the main range and the Caspian. It is here that is formed the remarkable country known as Daghestan, which is in fact a great mountain plateau, sloping gently towards the Caspian at an elevation of not less than 7000 to 8000 feet, furrowed by deep valleys or ravines, cut by the streams that descend from the central range. It was this peculiar conformation of the tract in question that so long enabled the mountain tribes of this part of the Caucasus to defy the arms of Russia. Gunib, the last stronghold of Schamyl, is a mountain that rises to 7742 feet, with precipitous sides;

other summits in the same region attain to a still greater elevation,—Intscharo to 9469 feet, Schumi Dagh to 9733 feet, and Dschufa Dagh to 9900 feet. At the point where this fan-shaped plateau joins on to the main range is found a cluster of peaks, all of them rising above the level of perpetual snow; while Alachun Dagh, an offshoot of the main range, between Sari Dagh and Dschufa Dagh is said to attain to 12,100.

Of the streams that traverse the elevated plateau of Daghestan, four are known by the common name of Koissu, but are distinguished as the Andi Koissu, the Avari Koissu, the Kara Koissu, and the Kazikumi Koissu. After flowing through extremely deep and narrow valleys, in many places mere gorges, they all unite their waters before they quit the mountains, and under the name of Sulak flow into the Caspian Sea about 90 miles north of Derbend. The only other river of Daghestan that deserves notice is the Samur, which takes its rise at the foot of Sari Dagh, and after sweeping round almost in a semicircle enters the Caspian a few miles south of Derbend. The most important of the streams that rise in the main chain east of the valley of the Terek, and flow northwards into that river, is the Argun. Those which traverse the country of the Tchetchens are of little consequence.

The secondary ranges on the south side of the Eastern Caucasus are of comparatively little interest or importance, and none of them attain to any considerable elevation. Two of these subordinate ranges, however, which branch off from the main chain but a little east of the Terek, constitute the limits which separate the valley of the Aragwa from that of the Jora, and the latter again from that of the Alazun. Both these rivers are among the most considerable of the affluents of the Kur, and the valleys through which they flow are two of the most fertile districts of Georgia. The valley of the Alazun especially, constituting the region known as Kakhetia, is celebrated for the abundance and excellence of its wines.

The preceding account of the physical structure of the Caucasus is derived from the latest works on the subject, but it must be admitted that our knowledge of this important chain is still far from possessing the completeness and accuracy which the geographer would desire. The Russian survey has been found by recent travellers to be often defective and erroneous in regard to the most interesting part of the chain—the range of glaciers and snow-clad peaks in the Central Caucasus—and will require much correction before it can compare with the maps that we now possess of the Alps and Pyrenees. Much confusion still exists with regard to the nomenclature of the different peaks, and this is aggravated by the different names given to them by the different races which inhabit the surrounding valleys. Thus Elbruz, as it is called by the Russians, is known to the neighbouring mountaineers only as Miughi Tau, and the mountain called by the Russians Kazbek, from the village of that name, is known to the Georgians, from whose plains it is a conspicuous object, as Mkinwari.

The scarcity of passes across the great chain of the Caucasus has been already adverted to. There exists in fact but one such natural pass, sufficiently practicable to afford direct communication between the countries to the north and south of the range, and this has in consequence been frequented in all ages. This is the line followed by the present highroad constructed by the Russians since their occupation of the country, from Vladikaskaz at the northern foot of the chain to Tiflis on the south. This route ascends the valley of the Terek from Vladikaskaz as far as Kobi (a distance of about 40 miles), where it quits the valley, which turns abruptly to the west, and is carried over the lofty crest or ridge known as the Krestowaja Gora (Mountain of the Cross), an elevation of nearly 8000

feet, from whence it descends to Mleti in the valley of the Aragwa, and follows the course of that stream nearly to Tiflis. The proper designation of this pass would undoubtedly be that of the actual passage over the summit level of the range, the Krestowaja Gora, but it is commonly known as the Pass of Dariel, from the remarkable gorge of that name through which it is carried between Lars and Kazbek,—a defile of the grandest and most impressive character, which is considered by recent travellers to be equal, if not superior, in point of scenery, to the finest defiles of the Alps. Previous to the formation of the present road, this deep and narrow gorge—affording only just passage for the torrent, while the mountains rise on each side abruptly to a height of at least 5000 feet above the level of the Terek—must have presented almost insuperable difficulties to the passage of traffic along this route. Hence it was known and celebrated from the earliest times, and is mentioned under the name of the Caucasian Gates (*Portæ Caucasice*) by Pliny (*Hist. Nat.*, vi. 2, § 30), who describes the pass as actually closed by a fortified gate, a measure which might have been easily adopted.

The only other line of communication in general use between the northern and southern regions bordering on the Caucasus, is that which skirts the eastern extremity of the range, where its offshoots descend to the shores of the Caspian. This passage presents almost no natural difficulties, the mountains for the most part not descending nearly to the sea, the shores of which are everywhere flat and low. In one place only does a range of hills, branching off from the more lofty masses of the chain, descend to within a short distance of the Caspian, so as to admit of the interval being closed by a fortified wall, which was in former times carried up the heights to the west for a considerable distance. The site is still guarded by a small fort and the town of Derbend, but the adjoining hills are not of a precipitous or impracticable character, so that the obstacles presented by this pass are merely of a military kind, and there is no difficulty in the construction of a road or railroad along this line, which has been, indeed, in all ages the natural highway by which nations north of the Caucasus have entered Georgia and Persia. Thus we are told by Herodotus (i. 104) that it was by this route that the Scythians penetrated into Media in the 7th century B.C.

On the other hand the western portion of the Caucasus, where it abuts upon the Black Sea, affords no natural passage along the coast, the underfalls of the chain descending so steeply to the sea, and being so rugged and broken, as well as densely covered with forest, as to preclude the existence of any practicable route on this side. It is certain, indeed, that Mithridates the Great, when hard pressed by Pompey, succeeded in forcing his way with an army from Colchis (Mingrelia) to the Cimmerian Bosphorus, along this line of coast, but the same Greek writers who recorded this wonderful march, dwelt largely upon the difficulties that he encountered. In modern times the Russians, during their long contest with the Circassians, established a continuous system of forts or small fortified posts along the whole of this line of coast, from Anapa to Sukhuin Kaleh; but these have now been almost all abandoned, and the communications are maintained exclusively by sea.

Climate and Natural Productions.—The chain of the Caucasus is situated between 45° and 40° 30' N. lat. It therefore corresponds in general position rather with the Apennines and the Pyrenees than with the Alps. But from its character as a great barrier extending across from sea to sea, it constitutes the limit between two climates which differ very widely from one another. The great

steppes and plains of Russia on the north side of the chain are open to the cold winds of the north, and partake to a great extent of the severity of a Russian winter; while the valleys of Imeritia and Georgia on the southern side are sheltered by the vast mountain wall to the north of them, and thence enjoy a climate more in accordance with their southerly latitude. Thus Tiflis, though situated at a height of about 1500 feet above the sea, has a mean temperature of 55°, and Kutais of more than 58°. The average *winter* temperature of Tiflis does not fall below 36°, and that of Kutais is not less than 42·5°.

But a still more remarkable contrast is that presented by the varying amount of rainfall in the different portions of the chain, according to their distance from the Black Sea. While the rainfall at Tiflis does not exceed 20 inches, it amounts to more than 57 inches at Kutais, and not less than 63 inches at Redut Kaleh on the sea shore near Poti.

The effects of these great variations in the meteorological conditions of the countries adjoining the Caucasus are naturally striking and strongly marked. Whatever be the contrasts presented by the two sides of the Alps, they are far more remarkable in the Caucasus. This is especially the case with the south-western valleys and slopes, where a great amount of rain is combined with a warm temperature. Hence all this part of the mountain country is characterized by a luxuriance of vegetation to which no parallel can be found in Europe. Magnificent forests clothe the mountain sides and extend down quite to the sea; while the rich valley, or rather basin, of the Rion equals any part of Italy in fertility, and is capable of producing all kinds of crops that flourish in the Italian plains. But as the traveller passes inland towards Tiflis, he is struck by the change that takes place after crossing the comparatively trifling range of the Suram Mountains. Arid upland plains and parched hill-sides take the place of the rich verdure and luxuriant forests of Imeritia and Mingrelia. A similar change is observed in the higher regions of the mountains on crossing the Mamisson Pass, which separates the head waters of the Ardon from those of the Rion. While the valleys west of this—especially that of the upper Ingur, or Snanetia—are covered with the richest vegetation, those on the other side, the valleys of the Ardon and Terek, are almost wholly bare of trees, and present only mountain slopes covered with grass, where they are not sheets of bare rock. The extensive pine forests, which constitute so important a feature in the scenery of the Alps, are almost wholly wanting in the Caucasus, or at least of only partial and occasional occurrence; and the description given by Mr Freshfield of the scenery of the Terek above Kazbek, that it presents “treeless valleys, bold rocks, slopes of forbidding steepness (even to eyes accustomed to those of the Alps), and stone-built villages, scarcely distinguishable from the neighbouring crags,” will apply with little variation to all the valleys that run northward from the central chain. But if the general scenery of these valleys be dull and uninteresting, there is a marked exception in the deep gorges by which in most cases their waters make their escape through the northern lateral ridge. These defiles are pronounced by competent judges to be far superior in grandeur to anything of the kind to be found in the Alps; that of Dariel has been already described, but the less known gorges of the Tcherek and the Urnch are considered by recent travellers to be still more striking and marvellous. At the same time the snowy ridges and peaks of the central chain are said to surpass those of the highest portions of the Alps in boldness and picturesqueness of outline, as well as in steepness and apparent inaccessibility, as much as they do in absolute elevation. On the whole it may be safely asserted that the Caucasus presents attractions to the traveller and the tourist beyond those of any other mountain

chain within such comparatively easy reach, and that it will year by year become better known and more frequently visited. The vegetation of the Caucasus is in general not materially different from that of the mountain chains of Central Europe. The extensive forests that clothe its flanks are composed entirely of the ordinary European trees, among which the oak, the beech, the elm, and the alder are the most prevalent, but a peculiar character is imparted to them by the dense undergrowth of rhododendrons, azaleas, box-trees, and laurels, as well as by the huge climbing masses of ivy, clematis, and wild vine, which attain to a height and size wholly unlike anything to be seen in Western Europe. Fruit trees of various kinds abound on the lower slopes of the hills, where the plum, the peach, the apple, and the pear are found wild, as well as the walnut, which is extensively grown in the cultivated regions, where it combines with the plane and the lime tree to form one of the chief ornaments of the landscape. The wild animals found in the Caucasus are Zool., for the most part the same with those of the mountainous regions of Central Europe, while others point to a transition toward the zoological character of Asia. Thus while it has the bear, the wolf, the wild boar, the lynx, in common with the Alps, the jackal is not unfrequent on its southern side, the hyæna is also found, and leopards are occasionally killed. Tigers do not appear to be ever found in the Caucasus proper, though they are killed from time to time in the districts of Lenkoran on the Caspian, south of the mouth of the Kur. The ibex or bouquetin, as well as the chamois, abounds among the higher summits of the range, and with them is found the wild goat (*Capra Egagrus*), and a species of moufflon or wild sheep. These vast forests of the western ranges still afford shelter to the aurochs or European bison, which now exists here alone in a truly wild state. It may be mentioned also that the southern slopes of the Caucasus are the native country of the pheasant, which derives its name, as well as its origin, from the River Phasis.

Geology.—The geology of the Caucasus is still but Geol. imperfectly known, though the long-continued labours of Dr Abich have thrown much light on the subject, and enabled us to trace at all events its general outlines. Throughout the most lofty part of the chain, from beyond Elbruz on the west to Kazbek on the east, the central ridge is composed of rocks of a granitic character; in great part indeed of pure granite. Immediately adjoining this granitic axis are found metamorphic rocks of the usual character,—mica-schists, talc-schists, &c.,—and beyond these, again, clay-slates and schists of uncertain age. The great limestone masses that form the secondary chains on each side of the central range (which rise to a height of 10,000 to 12,000 feet) are considered by Dr Abich to belong to the Jurassic formation, while the flanks and underfalls of the mountains on both sides are composed of Cretaceous strata, and these are again succeeded by Tertiary marls and sandstones, extending around the base of the chains, and forming its lowest declivities. This succession of the strata may be observed with great regularity and distinctness on the north side of the range, and is found on the southern side also, though more disturbed and irregular.

The principal disturbance on the north side is caused by the protrusion of the two great masses of Elbruz and Kazbek,—both of them of decidedly volcanic origin, and (geologically speaking) of comparatively recent date. They are composed principally of trachyte, but send down also vast streams of basaltic lavas, which form a striking feature in the scenery of the valleys beneath them.

The regularity of structure which may be considered as pervading the whole of this central mass of the Caucasus

disappears almost entirely as one passes eastward of the Kazbek. Though the axis of elevation still preserves very much the same general direction from north-west to south-east, the fundamental granitic ridge is altogether wanting; and even the highest summits of the range are composed of calcareous slates and sandstones, which were supposed by earlier geologists to belong to the Palæozoic period, but are assigned by Dr Abich to a much later age. Even the lofty summits of Schach Dag (the giant of the Eastern Caucasus) are composed of a dolomitic limestone, which appears to belong to the Neocomian era. To the same period may probably be referred the greater part of the limestones and shales which constitute the singular plateaux of Daghestan already described. But from the great scarcity of organic remains the determination of their age is a question of much difficulty.

minerals.

The mineral riches of the Caucasus are still in great measure unexplored. Iron and copper ores are known to exist in abundance; and coal is found in the valley of the Kuban, as well as in the upper valley of the Rion. But as it belongs to the Jurassic and not to the true Carboniferous age, it is doubtful to what extent it may prove productive. The remarkable springs of naphtha near Baku, which have long been known as an object of interest and a sanctuary of the fire worshippers, are now turned to account for the manufacture of petroleum on a large scale.

glaciers

It has already been observed that glaciers exist on a great scale in the Caucasus, but they are confined to a higher elevation than in the Alps. Notwithstanding the vast mass of glacier and perpetual snow which exists in the Central Caucasus, none of the lateral glaciers descend below 7000 feet on the southern side of the range; while the lowest point reached by any of those on the northern side is not below 5700 feet. But, as in the case of all the principal mountain chains of Europe, there is abundant evidence of the glaciers having once been much more extensive and having descended to a much lower level in the valleys than they at present occupy. At the same time it may be observed that there is a total absence in the Caucasus of those lakes which form so conspicuous a feature in the country on both sides of the Alps, and which are supposed by many geologists to be connected with glacial action.

ethnology.

Ethnology.—The ethnology of the Caucasus is still far from thoroughly known. From the earliest times it has been noted as the region where the greatest diversity of tribes and languages existed within the smallest space (Herodot., i. 203). Pliny tells us that no less than 130 different interpreters were required by the Greek traders at Dioscurias, the port where all the tribes of the neighbouring mountains, as well as the more remote nations of the interior used to congregate, while others raised the number to 300 (Plin. *H. N.*, vi. 5, § 15). This is of course a great exaggeration, but it proves the fact that there existed then, as at the present day, an extraordinary number of races speaking different and in many cases wholly dissimilar dialects. The researches of modern scholars have thrown considerable light upon the subject, and enabled us at least to classify these different tribes in certain groups or families.

I. The GEORGIAN, or, as they are sometimes termed by modern writers, the Kartalinian tribes, from their speaking a language called by themselves Kartli. These are in all probability the descendants of the people called by Greek writers Iberians, who were in possession of the country south of the Caucasus at the earliest period of which we have any historical account. The name of Georgian is comparatively modern, but its origin is unknown. To this family belong:—

1. The *Grusians* or *Georgians* proper, who inhabit the whole country east of the Suram mountains down to the lowland steppes of the River Kur. They extend also up the valley of the Aragva to

the very foot of the main range, and occupy the extensive valleys of Kakhetia and the slopes still further east.

2. The *Imeritians*, who extend from the watershed of the Suram mountains westward, including the valleys of the Rion or Phasis, and its tributary the Quirilla. Their western limit is the Znesquali, which separates them from the Mingrelians.

3. The *Mingrelians*, who extend from the Znesquali on the east to the Ingur and the Black Sea on the west, while the lower course of the Rion may be considered as constituting their limit on the south. Both these nations, though long politically independent of the Georgians, are undoubtedly of cognate race, and speak kindred dialects.

4. The *Gurians*, a small people occupying the strip of land between the Rion and the mountains on the south, which form the frontier between Russia and Turkey. Their language shows them to be of Georgian race, but they are closely connected with the Laz or Lazi, a tribe that inhabits the adjoining mountains within the Turkish territory, where they were already settled under the name of Lazi in the time of Strabo.

5. The *Suanians* or *Suanetians*, who occupy the upper valley of the Ingur, above the confines of Mingrelia. They are a wild and semi-barbarous mountain tribe, who have only lately been brought under subjection to the Russians, and are still left in a condition of semi-independence. But from the natural beauty of their country, and its proximity to the highest ranges of the Caucasus, they have attracted much attention from recent travellers. They are considered to belong to the same race with their neighbours the Georgians and Mingrelians; though they have existed from a very remote period as a separate tribe, being already mentioned under the name of Suanes or Suani by Strabo and Pliny, in whose time they were one of the most powerful nations in the Caucasus. Their language is a cognate dialect with the Georgian and Mingrelian, but presents very material differences.

11. The second principal group of the Caucasian mountaineers, and that which has of late years attracted the most attention of any, is that of the *Tcherkesses* or *Circassians* (a name of Russian origin), who until within a few years past constituted the whole population of the Western Caucasus on both sides of the mountain chain. They were subdivided into numerous tribes, but may be considered as belonging to three principal divisions.

1. The *Circassians* proper, who designate themselves by the name of Adighé, and who formerly occupied the whole coast of the Black Sea from the neighbourhood of Anapa to Pitzunta, as well as the northern slopes of the mountains towards the Kuban. It was this people who so long fixed the attention of all Europe by their long continued struggles against the Russian power, which, however, ended in their complete subjugation in 1864. But that event was followed by a wholesale emigration of the Circassians, who quitted their country to the number of 400,000 (or, according to other accounts, nearly 500,000) souls, and settled in the different provinces of the Turkish empire. The effect of this emigration, without a precedent in modern history, has been to leave the whole country between the Caucasus and the Black Sea, for a distance of nearly 200 miles, almost absolutely without inhabitants, except the small settlements of the Russians at Novo Kossisk, Tuapse, and Sukhum Kalch.

2. The *Abkhassians*, a tribe occupying the coast eastward from Pitzunta to the confines of Mingrelia. They are undoubtedly a kindred race with the Circassians, though described as in all respects inferior to them. Their numbers have also been thinned to a great extent by emigration, since their last abortive attempt at insurrection in 1864, so that the interior of the country formerly occupied by them is now almost uninhabited.

3. The *Kabardians*, who hold the country north of the main chain of the Caucasus, from the valley of the Kuban to that of the Terek, and extending quite down to the steppes on the north. Though resembling the other Circassians in language and manners, and like them professing the Mahometan religion, they never offered any very serious opposition to the Russian arms, and have long been peaceful subjects of the Russian empire.

111. Adjoining the Circassian races on the east, and occupying the very centre of the Caucasian range, are the *OSSETES*, an isolated race, differing both in language and in customs from their neighbours on all sides. Their country is traversed by the main range of the Caucasus, which has brought them into the notice of travellers, and many conjectures have been formed with regard to their original and ethnic affinities. It is, however, conclusively proved that they are an Aryan race, and their language has considerable affinity with the Medo-Persian branch of that family. Many resemblances have been traced in their manners and customs with those of the Germans, and some writers have supposed them to be a remnant of the Goths, while others regard them as the representatives of the Alani, who played so conspicuous a part towards the close of the Roman empire; but there is no real foundation for either theory, and the evidence of their language seems decisive, that, though belonging to the great Aryan family, they have no special affinity with the Germanic or Teutonic branch of it.

They call themselves Iron, the name Ossetes being that applied to them by the Georgians. Some of them are Mahometans, while the greater part profess Christianity, but retain many of their pagan rites and customs, and are in fact still more than half pagans. They hold the upper valley of the Terek, down to the pass of Dariel, as well as the mountain tract to the west of it, as far as the headwaters of the Ardou and the Mamisson Pass.

IV. The TCHETCHENS, a people who inhabit the northern slopes of the Eastern Caucasus, extending down to the valley of the Terek. They adjoin the Kabardans and Ossetes on the west, and the Lesghians towards the south, but do not extend up to the highest recesses of the range. They profess the Mahometan religion, and speak a language distinct from all others, of which it is said that there are more than twenty dialects, though their whole population is not estimated at more than 150,000 souls.

V. The LESGHIAN, a name under which are generally comprised all the inhabitants of the Eastern Caucasus, though consisting of many petty tribes, speaking dialects more or less different, and in some cases, it is said, radically distinct languages. Their chief seat is in the high mountain region extending eastwards from Kazbek, and including all the highest summits of the range as far as Baba Dag; but they occupy also the southern declivities of the mountains towards the valleys of the Alazun and the Kur, as well as the rugged mountain tract of Daghestan towards the north-east between the central range and the Caspian. It was these wild mountain tribes that so long offered an unavailing resistance to the Russian arms; but it is said that the only real bond of union among them was their devoted attachment to Islamism, and that no connection of race unites them together. Their ethnic relations are certainly still very obscure and imperfectly known, and it is supposed by some ethnologists that among them may be found remnants of a number of different nations and races. But it is more probable that when they come to be better known, they will be found to have for the most part a common origin, notwithstanding the remarkable diversity of dialects spoken among them. A few very small tribes, such as the Udi and the Kubatschi, seem, however, to form an exception, and to belong to essentially distinct races. The most cultivated, as well as the most powerful of the tribes of the Daghestan, is that of the Avars or Avari, who adjoin the Tchetchens on the north, and extend from thence to the central chain. They are the only Lesghian tribe who profess a written language, for which they make use of the Arabic characters.

It is unnecessary here to speak of the numerous Turco-Tartar tribes that inhabit the borders of Daghestan, between the mountains and the Caspian, as well as of the Cossacks of the Kuban and the Terek,—all these tribes, whether nomad or settled, being confined almost wholly to the plains and steppes that surround the mountains, and not forming any considerable ingredient in the population of the Caucasus itself.

The estimates of the numbers of these mountain tribes are very various, and the Russian official reports do not distinguish the population of the mountains from that of the adjoining districts included in the same governments. But it seems probable that, since the great emigration of the Circassian tribes, the whole population of the Caucasus does not exceed a million of souls.

History.

History.—The Caucasus was known to the Greeks from a very early period. Without referring to the fable of the Argonauts, it is certain that Greek navigators penetrated in very early times into the remotest parts of the Euxine, and carried on trade with the native population of Colchis, the name which they gave to the rich country at the mouth of the Phasis or Rion. Here, at a somewhat later date, they founded the flourishing settlement of Dioscurias, the name of which is still retained in Cape Iskuria, a few miles south of Sukhum Kaleh. Hence their attention could not fail to be attracted by the vast snowy range of the Caucasus, and we find its name already familiar to Æschylus, who speaks of its "star-neighbouring summits," and terms it the most lofty of mountains (*Prom. Vinct.*, 720). The same statement is repeated by Herodotus, who had a clear conception of its geographical position, as extending from the Caspian to the Euxine, and forming in this direction the limit of the Persian empire (i. 203, iv. 12). The mountain tribes still retained their independence under the successors of Alexander, and it does not appear that any considerable advance was made in the knowledge of these countries till the time of the great Mithridates, who subdued all the nations up to the very foot of the mountains, and even succeeded in making his way with an army along the coast of the Black Sea from Colchis to the Cimmerian Bosphorus. His wars in these regions were described by several Greek historians, and Strabo, writing from these materials, shows an acquaintance both with the Caucasus and the adjoining countries, remarkable for its clearness and accuracy. Pompey had declined to pursue Mithridates on his adventurous march, and no Roman general ever passed the Caucasus. Under the Roman Empire, however, the frequent relations maintained with the Armenians made the Romans familiar with the names of the Iberians and Albanians on the south side of the chain, while their connection with the tributary kings of Bosphorus opened out to them communications with the steppe country to the

north. Neither Pliny nor Ptolemy, however, add much that is material to the knowledge already possessed by Strabo.

In modern times the chief interest in these regions has arisen from the long-continued struggle of these mountain tribes against Russia, and the energy with which the Circassians and Lesghians especially maintained the contest for independence against all the power of that mighty empire. From the time of the annexation of Georgia, at the commencement of the present century, it became a great object with the Russians to obtain possession of the intermediate mountain country; but it was not till the treaty of Adrianople in 1829, by which the Turks ceded to the Russian Empire their nominal sovereignty over the Caucasian tribes, that their efforts assumed a systematic form. From that period till the year 1859, the contest was maintained almost without interruption, and with many alternations of success. The Russians had to encounter immense difficulties, to traverse dangerous passes, to burn down forests, and to sacrifice immense numbers of lives, in order to gain small portions of territory. The war was for a long time chiefly maintained by the Circassians under their native chiefs; and no sooner did their exertions relax in consequence of the exhaustion caused by a long continued contest, than a new enemy to Russia arose on the shores of the Caspian. Schamyl, the most devoted follower of the heroic Kasi Mullah, placed himself, on the death of that chief, at the head of the Lesghians. At once the prophet and the warrior of his race, by his enthusiasm and bravery he soon gained the confidence of the tribes, and prevailed upon them to follow a united and determined plan of action under his authority. His influence was daily increased, not only by the victories which he gained, but by the successful manner in which he frequently delivered himself and his followers from the most imminent dangers. His own escape from the rocky fortress of Achulko, where he was completely invested by the forces of General Grabbe, appeared both to his own countrymen and the enemy almost miraculous. The great exertions which were made by the Russians in the following years to reduce the tribes yet unsubdued, and those which had risen against their authority, were completely defeated by his indefatigable activity and bravery. In the year 1842, when the mountain tribes were filled with the greatest alarm in consequence of the advance of General Grabbe, that formidable enemy was completely defeated by Schamyl in the woods of Itchkeri. The Circassians, after again renewing their attacks upon the Russians in the neighbourhood of the Black Sea, were ultimately driven back to their fastnesses; but Schamyl still continued to maintain his position on the Caspian, and inflicted severe losses upon the armies of the enemy. The Russians were evidently at a loss how to proceed against a chief who had baffled all their schemes, who had been a prisoner in their hands, whose rocky home had been frequently in their possession, who had incurred the most imminent dangers and been driven to the greatest emergencies, and who was still opposing them with unconquerable resolution, watching the progress of their troops, cutting off their supplies, and harassing them by constant attacks. Various Russian generals were sent in succession to the Caucasus, new plans of action, defensive and offensive, were tried, but without effecting any permanent conquest.

The Crimean War (1854–1856) produced a temporary suspension of the efforts of the Russians in the Caucasus; but after its termination hostilities were resumed with increased vigour, both on the side of Circassia and in Daghestan. In the western districts, indeed, the contest never assumed any important character, and was carried on by a series of petty expeditions against the Circassian and Abkhasian tribes, who never acted in concert, and were compelled to submission one after the other. But it was not till the year 1864 that the last of these wild tribes was finally subdued, and the complete subjugation of the Circassians was secured by the emigration of the whole people in the manner already noticed. The contest in Daghestan, though it had assumed for a time more formidable dimensions, had been already brought to a close. All the efforts of Schamyl could not prevent the Russians from gaining ground. Step by step they advanced steadily, though slowly, into the interior of the mountain country, and at last in the winter of 1858–59 made themselves masters of Weden, Schamyl's principal stronghold, which was taken by storm, and he himself was obliged to flee. This event was followed by the submission of many tribes, and though Schamyl threw himself into the apparently impregnable mountain fastness of Mount Gunib, even this was surprised by the Russian general Prince. Bariatski, and Schamyl himself made prisoner (Sept. 6, 1859). From this time the war in the Caucasus was virtually at an end; the mountain tribes submitted one after the other, and notwithstanding some occasional petty outbreaks, appear to have passed quietly into the condition of Russian subjects.

It is only of late years that we have begun to obtain accurate information concerning the mountain chain of the Caucasus and the tribes that inhabit it. The works of the earlier travellers in this region—Pallas, Klaproth, &c.—treat principally of the countries that adjoin the Caucasus, rather than of the mountain ranges themselves, and even the elaborate work of Dubois de Montpereux

(*Voyage autour du Caucase*, 5 vols. 8vo, Paris, 1839-43) labours under the same defect. It was not, indeed, till after the complete subjugation or pacification of the mountain tribes by Russia that it was possible to carry on any systematic examination of the interior recesses of the great chain, and the foundation of a scientific knowledge of the Caucasus was first laid by the construction of the trigonometrical survey under General Chodzko from 1847 to 1863, and the publication of the map resulting from their labours on the scale of 5 versts to an inch. Recent travellers have indeed found that the portions of this work relating to the highest ranges of the Central Caucasus are often imperfect or erroneous; but the same was the case with the best maps of the Alps until very lately, and if our knowledge of the great Caucasian chain is still far inferior to that which we now possess of the principal European ranges, it is immeasurably in advance of that which we have attained concerning any other Asiatic mountains, except those parts of the Himalaya which have been surveyed by English engineers. Among recent writers the one who has contributed the most valuable information is A. Petzholdt, whose work (*Der Kaukasus*, 2 vols. 8vo, Leipzig, 1866) is the most useful book on the subject as yet published. The works of Dr Radde also supply valuable materials of a more special and detailed character. The more recent work of Baron Thielmann (*Travels in the Caucasus, Persia, and Turkey in Asia*, translated into English and published by Murray in 2 vols. 8vo, 1875) also contains much useful matter in a compendious and convenient form. Mr Freshfield's *Journey in the Central Caucasus and Bashan* (8vo, Lond., 1869) is not merely a record of his personal experiences, but an important contribution to our knowledge of the highest regions of the central chain, which he was the first to explore. His example has been already followed by Mr Grove, who has described some portions of the mountains not visited by Mr Freshfield (*The Frosty Caucasus*, 8vo, Lond., 1875), and there can be little doubt that successive explorers of a similar stamp will soon make us acquainted with the inmost recesses of the Central Caucasus. (E. H. B.)

CAUDETE, a town of Spain, in the province of Albacete, about 80 miles north of Cartagena. It was formerly fortified, and contains a town-house, a prison, a school of primary instruction, a Carmelite convent, and several other religious institutions. The inhabitants are engaged almost exclusively in agriculture and the manufacture of coarse fabrics for home consumption. Population, 6500.

CAUDINE FORKS (*Furculæ Caudinæ*), the name of an Italian valley, famous in Roman history on account of the disaster which there befell the Roman army during the second Samnite war, in 321 B.C. Livy describes the pass as an open space, grassy, and well-watered, completely surrounded by lofty and thickly-wooded mountains, except where a passage is afforded by two narrow gorges, situated opposite to one another (bk. ix. c. 2). It has been usually identified with the Val d'Arpaja, which is on the high road between Beneventum and Capua; and confirmation is found in the facts that this valley was known as the Caudine, and that close by there existed a village called Furculæ (now Forchia). But there is the almost conclusive objection that this valley does not answer to the above description (which is the only sufficient one which we possess), being surrounded by no mountains of any elevation, and having many outlets. A much more probable theory is that which declares it to be the little valley between Sta Agata and Moirano, through which flows the small stream of the Isclero; and which, as it meets the Val d'Arpaja near Caudium, would have an equal right to the name of Caudine Forks.

CAVA, or LA CAVA, a town of Italy in the province of Principato Citreriore, 28 miles by rail south-east of Naples, with a communal population of 19,500. It is the seat of a bishopric, has a cathedral and a diocesan seminary, and carries on the manufacture of silk, cotton, and woollen stuffs. In the vicinity is the famous Benedictine abbey of La Trinità della Cava, which was founded in the 11th century, and almost rivals Monte Casino in the number and value of its literary treasures. Its archives contain about 40,000 separate documents of parchment, and more than 60,000 manuscripts on paper,—of which a complete inventory is being published by Don Michele Morealdi under the title of *Codex Diplomaticus Cavensis*. The library, in spite of

losses sustained within the last two centuries, still preserves a number of rich and valuable manuscripts, and a collection of early specimens of typography. Among these may be mentioned the *Codex Legum Longobardorum*, which dates from the beginning of the 11th century; a MS. copy of the Vulgate of the 8th, an Isidorus of the 9th, and a prayer-book illustrated with miniatures ascribed to Fra Angelico da Fiesole. (See Dantier's *Monast. Benedict. d'Italia*, and two articles in *Academy*, vol. viii. pp. 262 and 364, 1875.)

CAVAIGNAC, LOUIS EUGÈNE (1802-1857), dictator at Paris during the insurrection of June 1848, was born there in 1802. His father was a member of the National Convention, and the family was marked by republican proclivities. After going through the usual course of study for the military profession, he entered the army in 1824, and served in the Morea in 1828. When the revolution of 1830 broke out, he was stationed at Arras, and was the first officer of his regiment to declare for the new order of things. In 1831 he incurred the displeasure of the Government of Louis Philippe by joining in a protest against its reactionary tendencies; but in 1832 he was recalled to the service, and sent to Algeria. This continued to be the main sphere of his activity for sixteen years, till the revolution of 1848; and he took an active part, though in a subordinate capacity, in the different sieges and campaigns by which Algeria was gradually reduced under French rule. After passing through almost all the successive grades in the army, he was, in 1844, raised to the rank of general of brigade, as a reward for his skill and courage. When the revolution of February (1848) took place, the Provisional Government appointed him governor-general of Algeria; and they shortly after offered him the post of minister at war, which he declined. On his election to the National Assembly, however, Cavaignac returned to Paris. When he arrived on the 17th May, he found the capital in an extremely critical state. The socialists of Paris, incited and organized by skilful leaders, were in a state of bitter hostility to the National Assembly, and a formidable insurrection was gradually maturing. The National Assembly had proved a bitter disappointment to them; for the peasant proprietors, terrified by the vast increase of taxation, and the general uncertainty of revolution, had returned a decidedly conservative majority. Several collisions had already taken place. The crisis was at last brought about by the threatened abolition of the national workshops (*ateliers nationaux*), which the reasonable majority of the Assembly was especially anxious for, as the finances were being ruined by the maintenance in utter idleness of 120,000 men. By the 22d of June a formidable insurrection had been organized, and it remained only for the National Assembly to assert its authority by force of arms. Cavaignac, first as minister at war, and then as dictator, was called to the task of suppressing the revolt. It was no light task, as the national guard was doubtful, regular troops were not at hand in sufficient numbers, and the insurgents had abundant time to prepare themselves. Various estimates at from 30,000 to 60,000 men, well armed and well organized, they occupied the north-eastern part of the city, their front line stretching from the Pantheon on the south of the Seine by the Pont St Michel to the Portes St Martin and St Denis. Resting on the Faubourg St Antoine as central point, and threatening the Hotel de Ville, they had entrenched themselves at every step behind formidable barricades, and were ready to avail themselves of every advantage that ferocity and despair could suggest to them. Cavaignac, knowing the work he had before him, remained inactive, notwithstanding the urgent representations of the civil members of Government, till a sufficient regular force had been collected. At last, by a strong combined movement on the two flanks

and against the centre of the insurgent forces, he attempted to drive them from their barricades,—with doubtful success for some time, as every inch of ground was disputed, and the Government troops were frequently repulsed, till, fresh regiments arriving, he forced his way to the Place de la Bastille, and crushed the insurrection in its headquarters. The contest, which raged from the 23d to the morning of the 26th of June, was, without doubt, the bloodiest and most resolute the streets of Paris have ever seen. It is calculated that more Frenchmen fell in it than in the bloodiest battles of the first empire.

Cavaignac was severely censured by some for having, by his delay, allowed the insurrection to gather head; but he was declared by an immense majority to have deserved well of his country, and continued to be president of the Executive Committee till the election of a regular president of the republic. It was expected that the suffrages of France would raise Cavaignac to that position. But the mass of the people, and especially the rural population, sick of revolution, and weary even of the moderate republicanism of Cavaignac, were anxious for a stable government. Against the five and a half million votes recorded for Louis Napoleon, Cavaignac received only a million and a half. Not without chagrin at his defeat, he withdrew into the ranks of the opposition. At the *coup d'état* of the 2d December 1851, he was arrested along with the other members of the opposition; but after a short imprisonment at Ham he was released, and, with his newly-married wife, lived in retirement till his death in 1857. Cavaignac was no statesman, but was a loyal, skilful, and courageous soldier, a zealous republican, and in every way an honourable man.

CAVAILLON, a town of France and important railway junction in the department of Vaucluse, on the right bank of the Durance, about 13 miles south-east of Avignon. The town is ill-built and dirty, and carries on a considerable trade in dried fruits, madder, and other productions of the fertile district in which it is situated. It has a fine town-house, an old church of the 12th century, dedicated to the Virgin and St Veran, and the mutilated remains of a triumphal arch which probably belongs to the time of Constantine. Numerous minor relics of the Roman period have been found to the south of the present town, on the site of the ancient Cabellio, a place of some note in the territory of the Cavares. In mediæval and modern history the town has for the most part followed the fortunes of the Comtat Venaissin, in which it was included; and down to the Revolution it was the see of a bishop, and had a large number of monastic establishments. Population in 1872, 3906 in the town, and 8034 in the commune.

CAVALCANTI, GUIDO, an Italian poet and philosopher of the 13th century, who died in 1300. He was the son of a philosopher whom Dante, in the *Inferno*, condemns to torment among the Epicureans and Atheists; but he himself was a friend of the great poet. By marriage with the daughter of Farinata Uberti, he became head of the Ghibellines; and when the people, weary of continual brawls, aroused themselves, and sought peace by banishing the leaders of the rival parties, he was sent to Sarzana, where he caught a fever, of which he died. Cavalcanti has left a number of love sonnets and canzoni, which were honoured by the praise of Dante. Some are simple and graceful, but many are spoiled by a mixture of metaphysics borrowed from Plato, Aristotle, and the Christian Fathers. They are mostly in honour of a French lady, whom he calls Mandetta. His *Canzone d'Amore* was extremely popular, and was frequently published; and his complete poetical works are contained in Giuntì's collection, Florence, 1527, Venice, 1531-2. He also wrote in prose on philosophy and oratory.

CAVALIER, JEAN (c. 1680-1740), the famous chief

of the Camisards, was born at Ribaute, near Anduse, in Lower Languedoc. The date of his birth is variously given between 1679 and 1685. It could hardly be so late as the last-named year, and may probably be assigned to the period between 1679 and 1681. He was the son of a peasant, and in boyhood was employed first in keeping sheep, and afterwards as a baker's apprentice. A pious mother trained him in the Reformed faith: The persecution of Protestants, which began after the revocation of the Edict of Nantes, and which was carried on with pitiless cruelty in the Cevennes, drove him from his native land in 1701, and he took refuge at Geneva. By the *dragonnades* of Louis XIV. the Protestants of the Cevennes were at last driven to revolt; and Cavalier, inspired with the hope of being their deliverer, a hope which was raised to the pitch of enthusiasm, it is said, by certain prophecies, returned to his own country in 1702. The insurrection broke out in July of that year, and Cavalier was one of the chosen leaders. Roland was named generalissimo, but Cavalier soon rose to share the chief command with him. Untrained in arms, he displayed not only a fiery courage, but extraordinary military skill. This must have been owing to some extent to the eager attention which he had paid, while keeping his sheep, to the manœuvres of the troops which were stationed in his native district. Although the *enfants de Dieu*, as the insurgents were called, numbered at the most only 3000 men in arms, they coped successfully again and again with the much more numerous forces of the king, and were never entirely conquered. After several affairs Cavalier changed the theatre of war to the Vivarais; and on the 10th of February 1703 he defeated the royalist troops on the Ardèche. A few days later he was completely defeated on the same ground and was supposed to have fallen. But he reappeared, was again defeated at Tour-de-Bellot (April 30), and again recovered himself, recruits flocking to him to fill up the places of the slain. By a long series of successes he raised his reputation to the highest pitch, and gained the full confidence of the people. It was in vain that more and more rigorous measures were adopted against the Camisards; in vain that their mountain district was ravaged, sacked, and burned by the Catholics. Cavalier boldly carried the war into the plain, made terrible reprisals, and threatened even Nîmes itself. On April 16, 1704, he encountered Marshal Montrevel himself at the bridge of Nages, with 1000 men against 5000; and though defeated after a desperate conflict, he made a successful retreat with two-thirds of his men. Marshal Villars was next sent against him, and instead of fighting proposed negotiation. Roland resolutely turned a deaf ear to him; but Cavalier agreed to treat. A conference was held at Nîmes, hostages being given to Cavalier; and he appeared with an armed and mounted escort, which was drawn up facing the guard of the marshal. The terms proposed were deferred to the decision of the king, Cavalier in the meanwhile retiring to Calvisson. In this place for some days the Camisards held their meetings openly, and thousands eagerly flocked to them. The result of the negotiation was that Cavalier received for himself a commission with a pension of 1200 livres, and for his brother a captain's commission. He was authorized to form a regiment of Camisards to be sent to Spain; and liberty was restored to his father and other Protestant prisoners. The treaty, which did not include any provision for general liberty of conscience, excited great indignation among the companions of Cavalier. They called him traitor and coward, and deserted him. Disheartened, and with little confidence in the promises of the court, Cavalier afterwards visited Paris for the purpose of an interview with Louis XIV. He was presented privately to the king at Versailles, but was ill received. His dis-

appointment and the reports which were current of intended attempts on his life or liberty induced him to leave France. He went to Switzerland, and afterwards to Holland; and there he married a daughter of Madame Dumoyer, the latter a lady of Nîmes, who had once been sought in marriage by Voltaire. He then passed into England for the purpose of recruiting his regiment of Camisards. He had an interview with Queen Anne, of which conflicting accounts are given. But so highly was his military genius valued that he was sent with his regiment to take part in the famous expedition to Spain, under the earl of Peterborough and Sir Cloudesley Shovel (May 1705). At the battle of Almanza his Camisards encountered a French regiment which they had met in the Cevennes, and, without firing, the foes rushed to a hand to hand fight and made a fearful slaughter. Cavalier was severely wounded, and was saved from death by an English officer. On his return to England a small pension was given him, and after long waiting he was made a major-general and named governor of Jersey. This post was afterwards exchanged for the governorship of the Isle of Wight. Cavalier died at Chelsea, in the first half of May 1740, and there his remains were interred. Malesherbes, the courageous friend and defender of Louis XVI., bears the following eloquent testimony to this young hero of the Cevennes:—"I confess," he says, "that this warrior, who, without ever having served, found himself by the mere gift of nature a great general,—this Camisard who was bold to punish a crime in the presence of a fierce troop which maintained itself by like crimes,—this coarse peasant who, when admitted at twenty years of age into the society of cultivated people, caught their manners and won their love and esteem,—this man who, though accustomed to a stormy life, and having just cause to be proud of his success, had yet enough philosophy in him by nature to enjoy for thirty-five years a tranquil private life,—appears to me to be one of the rarest characters to be found in history." There is a work, little esteemed, entitled *Memoirs of the War in the Cevennes, under Colonel Cavalier*, which appears to have been written not by Cavalier himself but by a French refugee named Galli. For a more detailed account see Mrs Bray's *Revolt of the Protestants of the Cevennes*, published in 1870.

CAVALLINI, PIETRO (c. 1259–1344), born in Rome towards 1259, was an artist of the earliest epoch of the modern Roman School, and was taught painting and mosaic by Giotto while employed at Rome; and it is believed that he assisted his master in the mosaic of the Navicella, or ship of St Peter, in the porch of the church of that saint. Lanzi describes him as an adept in both arts, and mentions with approbation his grand fresco of a Crucifixion at Assisi, still in tolerable preservation; he was, moreover, versed in architecture and in sculpture. According to George Vertue, it is highly probable that Cavallini executed, in 1279, the mosaics and other ornaments of the tomb of Edward the Confessor in Westminster Abbey. He would thus be the "Petrus Civis Romanus" whose name is inscribed on the shrine; but his extreme youth at this date tends to discredit the supposition. The work, if really his, must have been executed in Rome, where he appears to have constantly resided. He died in 1344, at the age of eighty-five, in the odour of sanctity, having in his later years been a man of eminent piety. He is said to have carved for the Basilica of San Paolo fuori le Mura, close to Rome, a crucifix which spoke in 1370 to a female saint.

CAVALLO, TIBERIUS (1749–1809), an electrician and natural philosopher, son of a physician established at Naples, was born in that city, March 30, 1749. His father died when he was only eleven years old, but he received a liberal education through the kindness of his friends, and com-

pleted his studies at the university of Naples. He was originally destined for commerce, and came to England in 1771, in order to obtain more complete information respecting the various objects of mercantile pursuit. But he soon abandoned his intention of adopting that mode of life, and determined to devote his time to science. His mind, however, was rather imitative than original; and he is said to have found it easier to learn Euclid by heart than in the ordinary way, which indeed he found impossible. He became a member of the Royal Academy of Sciences of Naples, and a fellow of the Royal Society of London. He died at London in 1809. The splendid improvements which had been lately made in electricity directed his attention to that department of natural philosophy; and his chief works are—*A Complete Treatise of Electricity* (1777), *Essay on Medical Electricity* (1780), and *The Elements of Natural and Experimental Philosophy* (1803).

CAVALRY. From the earliest dates, at which there is any record of armed men being systematically trained and organized, cavalry has always formed an integral part of every army, although the relative size and importance of the arm has varied, according to the nature of the country and the peculiarities of its inhabitants. Egypt probably affords the earliest historical records of any distinct attempt at military organization. In that country cavalry and horsemanship were held in high repute, according to the prophet Isaiah. Diodorus of Sicily tells us that Osymandias led 20,000 cavalry against the rebels in Bactriana, and that twenty-five generations elapsed between Osymandias and Sesostris, who seems to have been the chief founder of Egyptian greatness, and to have lived at a period indistinctly laid down in history, but certainly long prior to the Trojan war. In early times chariots appear to have been associated with the horsemen of an army, although perfectly distinct from them. Frequent references are made in the Bible to "chariots and horsemen;" and Josephus states that the army of Israelites that escaped from Egypt numbered 50,000 horsemen and 600 chariots of war. Herodotus frequently speaks of the cavalry arm, and Hippocrates mentions the existence of a corps of young women whose breasts were scarred to enable them to use the bow and javelin. Plato likewise speaks somewhat vaguely of a corps of young ladies about 500 B.C. The existence of Amazons as a race has never been supported by even moderately authentic testimony, although by some they were believed to live on the River Thermodon in the north of Asia Minor.

The first authentic account that we have of cavalry being regularly organized is given by Xenophon, who states that in the first Messenian war, 743 B.C., Lyeurgus formed his cavalry in divisions. Some hundred years later, in 371 B.C., Epaminondas raised a corps of 5000 cavalry, and from this date it may be said the arm was much cultivated throughout Greece, until Philip and Alexander of Macedon raised it to a great pitch of excellence. Both these monarchs were indebted for several of their greatest successes to the prowess of their cavalry; and the exploits of Alexander's 7000 horsemen at the battle of Arbela, 331 B.C., in which he signally defeated Darius, may well serve as an example for future generations. The Greek cavalry were divided into heavy, or "cataphracti," and light, or "me cataphracti." To these Alexander added a third class, termed "diinac hæ," who were trained to fight on foot or on horseback. After the death of Alexander the Great cavalry appears to have fallen into comparative disuse until the days of Hannibal and the Carthaginians. Dire experience, more especially the defeats of the Trebia and the Trasimene, taught the Romans the value of cavalry; and in the latter days of the republic it became the most popular and highly favoured service of

the Roman armies. According to Vegetius, the Roman cavalry was organized into ten troops or squadrons, forming a regiment of 726 horses, either intended to act independently or, more usually, attached to some special legion. As the Roman empire increased and brought many tributaries under its flag, the cavalry began to be drawn from those countries whose inhabitants were specially devoted to equestrian pursuits. The Gauls for many years furnished the principal part of the cavalry both in the Carthaginian and in the Roman armies, and appear to have rivalled the Numidians in efficiency. Strange to say, saddles were never used until the time of Constantine, and stirrups were introduced by the Franks about the middle of the 5th century.

In the Middle Ages the unwillingness to intrust any military power to the serfs rendered the upper classes the only soldiers, and as these did not deign to fight on foot cavalry became the basis of European armies. The knights and esquires were the nucleus, mounted attendant bowmen and pikemen being the secondary portion of the fighting power.

The invention of gunpowder and the decline of the feudal system wrought a change in military tactics, and from the organization of a standing army by Charles II. of France, in 1445, cavalry as it now exists may be said to date. As in early days, each country produced a species of cavalry in accordance with the characteristics of its inhabitants and the nature of its institutions. From Hungary came the Hussars, whose name is derived from the Hungarian word "Husz," twenty, and "ar," pay. Marshal Luxembourg appears to have been the first person who disciplined and organized these hussars, and in 1692 they were attached to his army as light troops and reconnoiters. Carabineers were of a somewhat earlier date, and seem to have come originally from Basque and Germany. The word carbine has been traced to an Arab word "karab," but this derivation is somewhat doubtful. Originally it was the custom for carabineers or horsemen armed with firearms to mount infantry behind them, and in 1543 King Louis of Nassau made use of this hybrid force in his operations against Bergen.

A few years later, in 1554, Marshal De Brissac formed a corps of mounted infantry and called them Dragoons, thus justifying Dr Johnson's definition of the word as "a man who serves indifferently either on foot or on horseback." The actual origin of the term dragoon has been ascribed to the dragon's head which, as a rule, adorned the muzzle of the firearm with which these horsemen were armed,—although this derivation again cannot be regarded as very certain. As firearms became more generally used, so the tactics and organization of cavalry underwent modifications. In the time of Francis I. the gens-d'armes of France were reckoned the best cavalry in Europe, and were formed in single rank. Somewhat later the Spauiards, and afterwards the Germans, carried off the palm; they went to the other extreme as regards formation, being formed in six and eight ranks, and were composed of a mixed force of arquebusiers and lancers. At this time military leaders failed to appreciate the true mission of cavalry, and assigned too great importance to the effect of firearms, too little to that of "cold steel." Maurice of Nassau was the first to train cavalry with a view to their mobility, and teach them to act by separate bodies, and in distinct lines. Now for the first time cavalry was organized by regiments, each regiment being composed of four squadrons, formed in five ranks, and numbering about 1000 horses. During the Thirty Years' War, from 1618 to 1648, the lance as a cavalry weapon gradually disappeared, partly on account of the amount of training which is necessary to insure its efficient use, and partly on

account of the exaggerated value attached to firearms as cavalry weapons. After Maurice of Nassau, Gustavus Adolphus appears as the next great cavalry leader, and was so successful in the employment of his cuirassiers and dragoons—into which two divisions his horsemen were classed—that all other European nations began to imitate him, and adopted his formation in three ranks. After the death of Gustavus Adolphus, until the wars with the Turks, the French appear to have been the most instructed and efficient in the employment of cavalry. The wars of Louis XIII. and Louis XIV. soon developed military art, and such great leaders as Turenne, Condé, Montecuculi, and Marlborough made their name. At this period defensive armour for cavalry was abolished, and lances were unknown except among irregular horsemen, who came from the plains of Poland and Russia. Excellent, however, as the French cavalry at this period undoubtedly was, it could not vie with that of the Turks either as regards its own efficiency or the results that it achieved. So formidable and so much feared were the Turkish horsemen that the Russian infantry when opposed to them invariably carried *chevaux-de-frise* in light carts for their protection. It has been very justly remarked that no other cavalry has ever obtained such an ascendancy as this over infantry.

Hitherto but little attention had been paid to the employment of cavalry off the field of battle for purposes of reconnoitring, although it had long exercised an important influence in action. Marshal Saxe, however, may be said to have introduced a new and more enlightened era in the history of the arm, he not only was the first to recognize the true mission and use of light cavalry, but also the necessity for celerity in movement and manoeuvre on all occasions. Although he cannot be said to have introduced horse artillery, which did not appear on the field of battle till 1762, still, by his timely use of guns in conjunction with cavalry at the battle of Fontenoy, he first showed how the two arms might be combined.

It cannot, however, be said that cavalry has ever before or since played the important part in war that it did in the days of Frederick the Great. This monarch recognized that the "arme blanche," and not the firearm, was the proper weapon for a mounted soldier. He discontinued firing in line, and the pitch of excellence at which his horsemen arrived under the leadership of Seidlitz, and the results they obtained, have never been equalled by the cavalry of any other nation. The battles of Zorndorf, Rosbach, Striegau, Kesselsdorf, and Leuthen still remain the most signal examples of what may be attained if to long previous training and preparation are joined brilliancy and rapidity of execution in the field. It required, however, long experience and the occasional disasters which befell him in the first and second Silesian wars before Frederick the Great appreciated the true principles of mounted warfare or put them into execution.

The next period in the history of cavalry may be said to date from the rise of Napoleon I. until the battle of Waterloo. The Republican armies of France were but ill provided with mounted troops, and the disaster of Wurzburg in 1796 nearly annihilated the comparatively few squadrons that France then possessed. The genius of Napoleon evinced itself as remarkably in the organization as in the leading of his armies, and his first care was to create a force of cavalry such as would enable him to reap the fruits of his victories. To his cavalry he was mainly indebted for some of his most signal triumphs, notably Marengo and Austerlitz, and to the manner in which he employed his mounted scouts and reconnoiters he owed the facility with which he so often out-manceuvred and anticipated his enemies. The Russian campaign of 1812 annihilated the

French cavalry, and there was not time to reorganize it before it was necessary again to take the field. Hence some of Napoleon's most decided successes in 1813 proved fruitless; as he himself remarked, had he possessed cavalry at the battles of Lützen and Bautzen the war would then have been brought to an end. It would here appear worthy of remark that defensive armour for cavalry, which had fallen into disuse, was re-introduced by Napoleon. He increased the French cuirassiers from one regiment to twelve, and they performed excellent service over afterwards. Similarly in Napoleon's time the lance began to be again used in Europe; in 1807 it was found that a Polish regiment of lancers was so useful that twelve lancer regiments were afterwards formed, and a certain proportion of this arm has ever since been maintained in all European armies. Any remarks, however, on cavalry in the time of Napoleon would be incomplete were no reference made to the Cossacks, who so much contributed to render the retreats from Russia and after Leipsic peculiarly disastrous to the French. These irregular horsemen, mounted on small horses and armed with lances, hung on the flanks and rear of the retreating enemy, and, although seldom standing to meet an attack, appeared to be ubiquitous, alike affording a screen for their own army and obtaining the fullest information regarding the movements of that opposed to them.

In the forty years' peace cavalry deteriorated like everything else connected with military science. In the Crimea, as the entire war may be said to have consisted of one siege, there was but little occasion for the use of cavalry, and the few opportunities afforded were certainly not turned to the best account. In the 1859 campaign between the French and Italians on the one side and the Austrians on the other, the nature of the country was unsuited to the action of cavalry, and except in some isolated instances, as on the field of Solferino, cavalry played a very unimportant part in the war. For many years the value of cavalry was only exemplified on the plains of India, where both the British and the native horsemen performed many deeds of valour and did excellent service. In 1866 there occurred the first great European war since Waterloo in which cavalry could be turned to full account. From long disuse and want of practice neither Austrians nor Prussians made sufficient use of the large force of horsemen which was at their disposal, and neither on the field of battle nor off it did they achieve any great distinction, although, undoubtedly, of the two the Austrians carried off the palm. They performed reconnoitring duties far more efficiently than their antagonists, and the manner in which they covered the retreat of their army after Königgratz was a model of devotion and bravery.

Four years later the experience gained by the Prussians in 1866 on the plains of Bohemia was in the fullest degree utilized, whereas their opponents the French only showed how splendid material may be sacrificed and how brilliant courage may be thrown away. Incessant practice during the four preceding years of peace had rendered the Prussian cavalry most proficient in all the duties of reconnoitring and outposts. The information they obtained and the manner in which they concealed the movements of the army in their rear mainly contributed to enable the leaders of the German army to carry out successfully their strategic plans, and their prowess on the field of battle when turned to account as at Mars-la-Tour was exerted to the best effect. The French cavalry, on the other hand, were remarkable more for bravery than efficiency. In place of being scattered in small parties some days in advance of an army they marched in masses frequently in its rear. Off the field of battle they were of no service, and on it they were needlessly sacrificed through the incapacity of their leaders.

History has few examples of bravery more devoted than that of the French cavalry at the battles of Wörth and Sedan, and none in which bravery was more entirely thrown away. After the fall of the empire it may be said that the French cavalry ceased to exist, and as it is an arm that cannot be improvised the republic had no time to replace what had been destroyed.

On the whole it cannot be said that the last two European wars have added much to the art of handling cavalry. The practice of spreading light troops two days' march in advance of an army was not new, although of late years it had fallen into disuse, and as regards the employment of mounted troops on the battle-field, it is still an unsettled question whether the recent improvements in firearms have or have not rendered it impossible for them ever to turn the tide of victory.

For the organization, equipment, and strength of the cavalry of the various armies of the present day see *ARMY*, vol. ii.

(F. S. R.)

CAVAN, an inland county in the province of Ulster, in Ireland, situated between 53° 43' and 54° 7' N. lat., and 6° 45' and 7° 47' W. long, is bounded N. by Fermanagh and Monaghan, E. by Monaghan and Meath, S. by Meath, Westmeath, and Longford, and W. by Longford and Leitrim. It has an area of 746 square miles, or 477,394 acres.

The surface of the country is uneven, consisting of hill and dale, without any great extent of level ground, but only in its northern extremity attaining a mountainous elevation. The barony of Tullyhaw, bordering on Fermanagh, a wild dreary mountain district, known as the kingdom of Glan or Glengavlin, contains the highest land in the county, called Slieve Russell. In the same barony is Quilca Mountain, the place of inauguration for the Macquies, chieftains of Fermanagh, held in veneration by the peasantry, in connection with legends and ancient superstitions. The remainder of the county is not deficient in wood, and contains numerous lakes, generally of small dimensions, but of much interest for their picturesque beauty, more especially Lough Onghter, which lies between the towns of Cavan and Killashandra. The chief river in the county is the Erne, which originates in the Lake of Scramby, one of the minor sheets of water communicating with Lough Gowra on the borders of Longford. The river takes a northerly direction by Killesandra and Belturbet, being enlarged during its course by the Annalee and other smaller streams, and finally enters Lough Erne near the northern limit of the county. The other waters, consisting of numerous lakes and their connecting streams, are mostly tributary to the Erne. A copious spring called the Shannon Pot, at the foot of the Chulagh Mountain, in the barony of Tullyhaw, is regarded as the source of the River Shannon. The Blackwater, a tributary of the Boyne, also rises in this county, near Bailieborough.

Branch lines of the Midland, Great Western, and Great Northern railways traverse the county.

The climate is not very genial owing to the dampness arising from its numerous lakes and the nature of the soil, and to the boisterous winds which frequently prevail, more especially in the higher districts.

The south-eastern portion of Cavan rests upon clay-slate, and the remainder of the county upon the Carboniferous limestone formation. A rich iron ore was formerly raised from Quilca Mountain. Indications of lead, silver, and sulphur have been observed; and fullers' earth, pipe-clay, potters' clay, and brick clay are frequently met with in Tullyhaw barony, in which there are also indications of coal. Several mineral springs exist in this county, the chief of which is near the once-frequented village of Swanlinbar. In the neighbourhood of Belturbet, near the

small lake of Annagh, is a carbonated chalybeate. There are several other springs of less importance; and the small Lough Leighs, or Lough-an-Leighaghs, which signifies the healing lake, on the summit of a mountain between Bailieborough and Kingscourt, is celebrated for its antiscorbutic properties. The level of this lake never varies. It has no visible supply nor vent for its discharge; neither is it over frozen during the severest winters.

The soil is generally a stiff clay, cold and watery, but capable of much improvement by drainage, for which its undulating surface affords facilities. Agriculture has made little progress within the last twenty years; the extent of the farms being generally small. In the mountainous parts, however, where the land is chiefly under grazing, the farms are larger, and in stock raising the county has made considerable progress.

From the Owners of Land Return (1876) it appears that in 1875 Cavan was divided among 1044 proprietors, 328 of whom owned less than 1 acre, and 716 one acre and upwards. The largest estates were those of Lord Farnham (29,455 acres), Earl Annesley (24,221), and E. J. Saunderson (12,362). The average rateable value of the land was 11s. 10³/₄d. per acre, while that of all Ulster was 15s. 8¹/₄d.; and the average extent of the properties was 435 acres per owner, or nearly double the average size for Ulster, which was 239.

The following tables give comparative statements of the agriculture acreage in the years in 1853 and 1875, and of the live stock in 1852 and 1875 respectively:—

	Oats.	Wheat, Barley, &c.	Flax.	Potatoes.	Turnips and other Green Crops.	Meadow.	Under Crops.
1853.....	89,929	2,883	12,106	27,734	8,368	34,921	176,591
1875.....	52,826	665	5,298	28,823	6,754	61,946	156,312

	Horses, Mules, and Asses.	Cattle	Sheep.	Pigs.	Goats.	Poultry.
1852.....	19,381	92,690	16,167	24,715	14,024	323,241
1875.....	19,439	120,399	27,322	42,263	15,800	422,501

The number of goats raised here greatly exceeds that in the other counties, with the exception of Kerry and Cork.

Cavan is not a manufacturing county. The bleaching of linen and the distillation of whisky are both carried on to a small extent; but the people are chiefly employed in agricultural pursuits and in the sale of home produce. The soil in those districts not well adapted for tillage is peculiarly favourable for trees. The woods were formerly very considerable, and the timber found in the bogs is of large dimensions; but plantations are now chiefly found in demesnes, where they are extensive.

The population is less mixed in race than most parts of Ulster, being generally of Celtic extraction. The dwellings of the peasantry are poor in accommodation. There are in the county only four towns with upwards of 1000 inhabitants, viz., Cavan, Cootehill, Belturbet, and Bailieborough. The population in 1851 amounted to 174,064, and in 1871 to 140,735 (with an excess of 223 males), showing a decrease in twenty years of 33,329 persons, being an average of 1666 per annum, or 19 per cent., on the population of 1851. This is considerably above the average decrease of Ulster. At the census of 1871 there were 113,174 Catholics, 21,223 Episcopalians, 15,004 Presbyterians, and 1334 of other denominations, showing that 80 per cent. of the inhabitants professed the Catholic faith.

With regard to emigration, it appears that 11,129 persons left the county within the five years ending 1875, being at the rate of 2226 per annum, which is about the average of the rest of the province. The poor law is administered by a subdivision of the county and parts of the adjacent district into four unions, and these relieved 5126 paupers in 1874. Education is dispensed by means of 8 superior

and 340 primary schools. In 1871 the number of persons of five and upwards who could read and write was 55,773; 31,438 could read but could not write, and 48,104 could neither read nor write.

The county is divided into eight baronies—Castlerahan, Clanmahon, Clankée, Loughtee Lower and Upper, Tullygarvey, Tullyhaw, and Tullyhunco, and contains thirty-six parishes and parts of parishes. It is almost entirely within the diocese of Kilmore. In military arrangements it is in the Belfast district; and there are barracks for cavalry at Belturbet, and for infantry at Cavan, where also the staff of the county militia is stationed. The assizes are held at Cavan, where the county prison and the county infirmary are situated. Prior to the Union it returned six members to the Irish parliament, two for the county at large, and two for each of the boroughs of Cavan and Belturbet; but since that period it has been represented in the imperial parliament by two county members only.

The most ancient geographers describe this and the adjacent counties of Leitrim and Fermanagh as occupied by the tribe of the Erdini. At the period of the English settlement, and for some centuries afterwards, it was known by the name of the Brenny, or O'Reilly's country; and its inhabitants, protected by the nature of the country, long maintained their independence. In 1584 Cavan was formed into a county of Ulster by Sir John Perrott, lord-deputy of Ireland, and subdivided into seven baronies, two of which were assigned to Sir John O'Reilly, free of all contributions, and three to other members of the family; while the two remaining baronies, possessed by the septs of Mackernon and Macgauran, and situated in the mountains bordering on O'Rourke's country, were left subject to their ancient tenures and the exactions of their Irish lord, the Crown reserving 200 beeves upon the whole county for the lord-deputy's provision. There was also an ancient subdivision, peculiar to this county, into polls, each of which contained about 25 acres. Early in the reign of James I., a commission of inquiry was issued concerning all lands in several counties of Ulster, escheated to the Crown by attainder, outlawry, or actual death in rebellion, by which the greater portion of this county was deemed to be vested in the Crown, and its exact state thereupon investigated. Under the consequent project for the new plantation of Ulster, the county was distributed among the undertakers, British planters, servitors, natives, ecclesiastics, &c. The principal English and Scotch families settled in Cavan were the Auchmuties, Bailies, Butlers, Hamiltons, Lamberts, Parsons, and Ridgeways. Some few remains of antiquity remain in the shape of cairns, raths, and the ruins of small castles.

CAVAN, the capital of the above county, and, previous to the Union, a parliamentary borough, but now placed under the Towns Improvement Act, is situated near the centre of the county. It is 68 miles N.W. from Dublin (85¹/₂ by rail), on one of the tributary streams of the Annalee River, in a large valley surrounded on every side by elevated ground, with picturesque environs, adorned by the mansions and demesnes of Lord Farnham and the bishop of Kilmore. The town, which in 1871 contained 3380 inhabitants, is of unpretending and rather humble appearance. The court-house, erected at an expense of £11,000, is elegant in its proportions and convenient in its internal arrangements. The parish church, built on an elevated site, is also a graceful structure. The most conspicuous building is the grammar-school, founded by Charles I. It was rebuilt in 1819, at an expense of £9000, on an eminence overlooking one of the main entrances into the town, and is capable of accommodating one hundred resident pupils. The other public buildings are the Roman Catholic chapel and Dissenters' meeting-houses, the county gaol and in-

firm, barracks, and the union workhouse. Cavan has still some linen trade, and a considerable retail business is transacted in the town. It is the seat of a presbytery of the Presbyterian church, but the great majority of the inhabitants are Roman Catholics. A monastery of Dominican friars, founded by O'Reilly, chieftain of the Breanny, formerly existed here, and became the burial-place of the celebrated Irish general, Owen O'Neal, who died as is supposed by poison, in 1649, at Cloughoughter. This monastery, and all the other antiquities of the town, have been swept away during the violent and continuous feuds to which the country has been subjected. Even so late as the year 1690 the chief portion of the town was burned by the Enniskilleners under General Wolsley.

CAVANILLES, ANTONIO JOSE (1745-1804), a Spanish ecclesiastic who devoted himself to botany, was born at Valencia in 1745. He was educated by the Jesuits at the university of that town, and became tutor of the sons of the Duke of Infantado, whom he accompanied to Paris. There he resided twelve years, enjoying the friendship of the famous Jussieu, whose views he adopted. He afterwards became director of the royal garden at Madrid. In 1789 and the following years, he published *Dissertations upon Monadelphous Plants*, and in 1790 he commenced to issue his work on the plants of Spain, and those discovered by Spanish navigators in Mexico, Peru, Chili, New Holland, and the Philippine Islands.

CAVE (Latin *cavea*), a hollow extending beneath the surface of the earth. Caves have excited the awe and wonder of mankind in all ages, and have been the centres round which have clustered many legends and superstitions. They were the abode of the sibyls and the nymphs in Roman mythology, and in Greece they were the temples of Pan, Bacchus, Pluto, and the Moon, as well as the places where the oracles were delivered at Delphi, Corinth, and Mount Cithæron. In Persia they were connected with the obscure worship of Mithras. Their names frequently are survivals of the superstitious ideas of antiquity, as for example, the Fairy, Dragon's, or Devil's Caves of France and Germany. Long after the Fairies and Little Men had forsaken the forests and glens of Germany, they dwelt in their palaces deep in the Hartz Mountains, in the Dwarfholes, &c., whence they came from time to time into the upper air.

The Seven Sleepers of Ephesus slept their long sleep in a cave. The hills of Granada are still believed by the Moorish children to contain the great Boabdil, and his sleeping host, who will awake, when an adventurous mortal invades their repose, to restore the glory of the Moors in Spain.

Caves have been used in all ages by mankind for habitation, refuge, and burial. In the Old Testament we read that when Lot went up out of Zoar he dwelt in a cave with his two daughters. The five kings of the Canaanites took refuge from Joshua, and David from Saul, in the caves of Palestine, just as the Aquitani fled from Cæsar to those of Auvergne, and the Arabs of Algeria to those of Dahra, where they were suffocated by Marshal Pelissier in 1845. In Central Africa Dr Livingstone tells us that there are vast caves in which whole tribes find security with their cattle and household stuff.

The cave of Machpelah may be quoted as an example of their use as sepulchres, and the rock-hewn tombs of Palestine and of Egypt, and the Catacombs of Rome probably owe their existence to the ancient practice of burial in natural hollows in the rock. We might therefore expect to find in them most important evidence as to the ancient history of mankind, which would reach long beyond written record; and since they have always been used by wild beasts as lairs we might reasonably believe also that

their exploration would throw light upon the animals which have in many cases disappeared from the countries which they formerly inhabited. The labours of Buckland, Pengelly, Falconer, Lartet, and Christy, and Dawkins, carried on during the last fifty years in the caves, have added an entirely new chapter to the history of man in Europe, as well as established the changes that have taken place in the European fauna. The physical history of caves will be taken first, and we shall then pass on to the discoveries relating to man and the lower animals which have been made in them of late years.

Physical History.—The most obvious agent in hollowing out caves is the sea. The set of the currents, the force of the breakers, the grinding of the shingle inevitably discover the weak places in the cliff, and leave caves as one of the results of their work, modified in each case by the local conditions of the rock. Those formed in this manner are easily recognized from their floors being rarely much out of the horizontal; their entrances are all in the same plane, or in a succession of horizontal and parallel planes, if the land has been elevated at successive times. From their inaccessible position they have been rarely occupied by man. Among them Fingal's Cave, on the island of Staffa, off the south-west coast of Scotland, hollowed out of columnar basalt, is perhaps the most remarkable in Europe. In volcanic regions also there are caves formed by the passage of lava to the surface of the ground, or by the expansion of steam and gases in the lava while it was in a molten state. They have been observed in the regions round Vesuvius and Etna, in Iceland and Teneriffe. We may take as an example the Grotto del Cane (cave of the dog), near Pozzuoli, a few miles to the south-west of Naples, remarkable for the flow of carbonic acid from crevices in the floor, which fills the lower part of the cave and suffocates any small animal, such as a dog, immersed long enough in it.

The most important class of caves, however, and that which immediately demands our notice, is that composed of those which have been cut out of calcareous rocks by the action of carbonic acid in the rain-water, combined with the mechanical friction of the sand and stones set in motion by the streams which have, at one time or another, flowed through them. They occur at various levels, and are to be met with wherever the strata are sufficiently compact to support a roof. Those of Brixham and Torquay, and of the Eifel are in the Devonian limestone; those of Wales, Somerset, the central and northern counties of Belgium, Saxony, and Westphalia, of Maine and Anjou, of Virginia and Kentucky, are in that of the Carboniferous age. The cave of Kirkdale in Yorkshire, and most of those in Franconia and Bavaria, penetrate Jurassic limestones. The compact Neocomian and cretaceous limestones of Central France contain most of the caverns of Perigord, rendered famous by the discovery of the remains of the Eskimos along with the animals which they hunted; as well as those of Northern Italy, Sicily, Greece, Dalmatia, Carniola, and Palestine. The cave of Lunelviel near Montpellier is the most important of those which have been hollowed in limestones of the Tertiary age. They are also met with in rocks composed of gypsum; in Thuringia, for example, they occur in the saliferous and gypseous strata of the Zechstein, and in the gypseous Tertiary rocks of the neighbourhood of Paris, as for example at Montmorency.

Caves formed by the action of carbonic acid, and the action of water are distinguished from others by the following characters. They open on the abrupt sides of valleys and ravines at various levels, and are arranged round the main axes of erosion, just as the branches are arranged round the trunk of a tree. In a great many cases the relation of the valley to the ravine, and of the ravine to

the cave, is so intimate that it is impossible to deny that all three have been produced by the same causes. The caves themselves ramify in the same irregular fashion as the valleys, and are to be viewed merely as the capillaries in the general valley system through which the rain passes to join the main channels. Sometimes, as in the famous caves of Adelsberg, Kentucky, Wookey Hole in Somersetshire, the Peak in Derbyshire, and in many in the Jura, they are still the passages of subterranean streams; but very frequently the drainage has found an outlet at a lower level, and the ancient watercourses have been deserted. These in every case present unmistakable proof that they have been traversed by water in the sand, gravel, and clay which they contain, as well as in the worn surfaces of the sides and bottom. In all districts where there are caves there are funnel-shaped depressions of various sizes called pot-holes or swallow-holes, or *bétoires*, "*chaldrons du diable*," "*marinites des géants*," or "*kata-vathra*," in which the rain is collected before it disappears into the subterranean passages. They are to be seen in all stages, some being mere hollows which only contain water after excessive rain, while others are profound vertical shafts into which the water is continually falling. That known as Helln Pot in Yorkshire, 300 feet deep, is an example of the latter class. The cirques described by M. Desnoyers belong to the same class as the swallow-holes.

The history of swallow-holes, caves, ravines, and valleys in calcareous strata may be summed up as follows. The calcareous rocks are invariably traversed by joints or lines of shrinkage, which are lines of weakness by which the direction of the drainage is determined; and they are composed to a large extent of carbonate of lime, which is readily exchanged into soluble bicarbonate by the addition of carbonic acid. The rain in its passage through the air takes up carbonic acid, and it is still further charged with it in percolating through the surface soil in which there is decomposing vegetable matter. As the rain drops converge towards some one point, determined by some local accident on the surface, and always in a line of joint, the carbonic acid attacks the carbonate of lime with which it comes into contact, and thus a funnel is gradually formed ending in the vertical joint below. Both funnel and vertical joint below are being continually enlarged by this process. This chemical action goes on until the free carbonic acid is used up. The subterranean passages are enlarged in this manner, and what was originally an insignificant net-work of fissures is developed into a series of halls, sometimes as much as from 80 to 100 feet high. These results are considerably furthered by the mechanical friction of the pebbles and sand hurried along by the current, and by falls of rock from the roof produced by the removal of the underlying strata. In many cases the results of this action have produced a regular subterranean river system. The thick limestones of Kentucky, for example, are traversed by subterranean waters which collect in large rivers, and ultimately appear at the surface in full power. The River Axe, near Wells, the stream flowing out of the Peak Cavern at Castleton, Derbyshire, that at Adelsberg (see *ADELSBERG*, vol. i. p. 151) in Carniola, flow out of caverns in full volume. The River Styx and the waters of Acheron disappear in a series of caverns which were supposed to lead down to the infernal regions.

If the direction of the drainage in the rock has been altered, either by elevations such as those with which the geologist is familiar, or by the opening out of new passages at a lower level, these watercourses become dry, and present us with the caves which have afforded shelter to man and the wild animals from the remotest ages, sometimes high up on the side of a ravine, at other times close to the level of the stream at the bottom.

Caves, as a general rule, are as little effected by disturbances of the rock as the ravines and valleys, which have been formed, in the main, irrespective of the lines of fault or dislocation.

We must now examine what happens to the bicarbonate of lime which has been formed by the action of the acid on the limestone. If a current of air play upon the surface of the water, the carbonic acid, which floats up the lime, so to speak, is given off and the insoluble carbonate is deposited, and as a result of this action we have the elaborate and fantastic stony incrustations termed stalactites and stalagmites. The water percolating through the rock covers the sides of the cavern with a stalactitic drapery, and if a line of drops persistently falls from the same point to the floor, the calcareous deposit gradually descends from the roof, forming in some cases stony tassels, and in others long columns which are ultimately united to the calcareous boss, formed by the splash of the water on the floor. The surface also of the pools is sometimes covered over with an ice-like sheet of stalagmite, which shoots from the sides, and sometimes forms a solid and firm floor when the water on which it was supported has disappeared. Sometimes the drops form a little calcareous basin, beautifully polished inside, which contains small pearl-like particles of carbonate of lime, polished by friction one against the other. The most beautiful stalactitic caves in Great Britain are those of Cheddar in Somerset, Caldry Island, and Poole's Cavern at Buxton. A portion only of the carbonate of lime is thus deposited in the hollows of the rock from which it was taken; the rest is carried into the open air by the streams, in part deposited on the sides and bottom, forming tufa and the so-called petrifications, and partly being conveyed down to the sea to be ultimately secreted in the tissues of the Mollusca, Echinodermata, and Foraminifera. Through these it is again collected in a solid form, and in the long course of ages it is again lifted up above the level of the water as limestone rock, and again undergoes the same series of changes. Thus the cycle of carbonate of lime is a never-ending one from the land to the ocean, from the ocean to the land, and so it has been ever since the first stratum of limestone was formed out of the exuviae of the inhabitants of the sea. The rate of the accumulation of stalagmite in caverns is necessarily variable, since it is determined by the presence of varying currents of air. In the Ingleborough cavern a stalagmite, measured in 1839 and in 1873, is growing at the rate of .2946 inches per annum. It is obvious, therefore, that the vast antiquity of deposits containing remains of man underneath layers of stalagmite cannot be inferred from a thickness of a few inches or even of a few feet.

The intimate relation which exists between caves and ravines renders it extremely probable that many of the latter have been originally subterranean watercourses, which have been unroofed by the degradation of the rock. In all limestone districts ravines are to be found continued in the same direction as the caves, and the process of atmospheric erosion may be seen in the fallen blocks of stone which generally are to be met with at the mouths of the caverns. In illustration of this the valley and caves of Weathercote, in Yorkshire, may be quoted, or the source of the Axe at Wookey; and the ravine formed in this way has very frequently been widened out into a valley by the action of subaerial waste, or by the grinding of glaciers through it during the glacial stage of the Pleistocene period.

Pleistocene Caves in Europe.—The caves which have offered shelter to man and the wild animals are classified according to their contents. 1st, Those containing the extinct animals, such as the mammoth, woolly rhinoceros, or Palæolithic man (see *ARCHÆOLOGY*); are termed

Pleistocene. These are sometimes called Quaternary, under the mistaken idea that they belong to an age succeeding the Tertiary period. 2d, Those which contain the remains of the domestic animals in association with the remains of man either in the Neolithic, Bronze, or Iron stages of civilization are termed Prehistoric. 3d, The third group consists of those which can be brought into relation with the historic period, and are therefore termed Historic.

The search after *ebur fossile* or unicorn's horn, or in other words the fossil bones which ranked high in the *matéria medica* of the 16th and 17th centuries, led to the discovery of the ossiferous caverns of the Hartz Mountains, and of Hungary and Franconia. The famous cave of Gailenreuth in the last of these districts was explored by Dr Goldfuss in 1810. The bones of the hyæna, lion, wolf, fox, and stag, which it contained, were identified by Baron Cuvier, and some of the skulls have been recently proved by Professor Busk to belong to the grizzly bear. They were associated with the bones of the reindeer, horse, and bison, as well as with those of the great cave bear. These discoveries were of very great interest, because they established the fact that the above animals had lived in Germany in ancient times. The first bone cave systematically explored in England was one at Orreton near Plymouth in the year 1816, which proved that an extinct species of rhinoceros (*R. Megarhinus*) lived in that district. Four years later the famous hyæna den at Kirkdale in Yorkshire was explored by Dr Buckland. He brought forward proof that it had been inhabited by hyænas, and that the broken and gnawed bones of the mammoth, rhinoceros, stag, bison, and horse belonged to animals which had been dragged in for food. He pointed out that all these animals had lived in Yorkshire in ancient times, and that it was impossible for the carcasses of the rhinoceros, hyæna, and mammoth to have been floated from tropical regions into the places where he found their bones. He subsequently investigated bone caves in Derbyshire, South Wales, and Somerset, as well as in Germany, and published his *Reliquiæ Diluvianæ* in 1822, a work which laid the foundations of the new science of cave-hunting in this country. The well-known cave of Kent's Hole near Torquay, furnished the Rev. J. McEnery, between the years 1825 and 1841, with the first flint implements discovered in intimate association with the bones of extinct animals. He recognized the fact that they proved the existence of man in Devonshire while those animals were alive, but the idea was too novel to be accepted by his contemporaries. His discoveries have since been verified by the subsequent investigations carried on by Mr Godwin Austen, and ultimately by the committee of the British Association, which has been at work for several years under the guidance of Mr Pengelly. There are four distinct strata in the cave. 1st, The surface is composed of dark earth, and contains mediæval remains, Roman pottery, and articles which prove that it was in use during the Iron, Bronze, and Neolithic ages. 2d, Below this is a stalagmite floor, varying in thickness from 1 to 3 feet, and covering (3d) the red earth, which contained bones of the hyæna, lion, mammoth, rhinoceros, and other animals, in association with flint implements and an engraved antler, which proved man to have been an inhabitant of the cavern during the time of its deposition. 4th, Filling the bottom of the cave is a hard breccia, with the remains of bears and flint implements, in the main ruder than those found above; in some places it was no less than 12 feet thick. The most remarkable animal found in Kent's Hole is the sabre-toothed carnivore, *Machairodus latidens* of Owen. While the value of Mr McEnery's discoveries was in dispute the exploration of the cave of Brixham near Torquay in 1858 proved that man was coeval with the extinct mammalia, and in the following year additional proof was

offered by the implements that were found in Wookey Hole. Similar remains have been met with in the caves of Wales, and in England as far north as Derbyshire (Creswell), proving that over the whole of southern and middle England men, in precisely the same stage of rude civilization, hunted the mammoth and rhinoceros and other extinct animals.

Cave-dwellers allied to Eskimos.—The caves and rock shelters of Perigord, explored by the late M. Lartet and our countryman Mr Christy, in 1863–4, have not only afforded accumulative proof of the co-existence of man with the extinct mammalia, but have given us a clue as to the race that so existed. They penetrate the sides of the valleys of the Dordogne and Vézère, and offer as vivid a picture of the life of the period as that revealed of Italian manners in the 1st century by the buried cities of Herculaneum and Pompeii. The old floors of human occupation consist of broken bones of animals killed in the chase, mingled with rude implements and weapons of bone and unpolished stone, and with charcoal and burnt stones, which indicate the position of the hearths. Flakes without number, awls, lance-heads, hammers, and saws made of flint rest *pêle-mêle* with bone needles, sculptured reindeer antlers, arrowheads, and harpoons, and bones of the reindeer, bison, horse, ibex, Saiga antelope, and musk sheep. These singular accumulations of *débris* mark the places where the ancient hunters lived, and are merely the refuse cast aside. The reindeer formed by far the greater portion of the food, and must have lived in enormous herds at that time in the centre of France. From this, as well as from the presence of the most arctic of the herbivores, the musk sheep, we may infer the severe climate of that portion of France at that time. Besides these animals the cave bear and lion have been met with in one, and the mammoth in five localities, and their remains bear marks of cutting or scraping which showed they fell a prey to the hunters. The most remarkable remains left behind in these refuse heaps are the sculptured reindeer antlers and figures engraved on fragments of schist and on ivory. A well-defined outline of an ox stands out boldly from one piece of antler; a second represents a reindeer kneeling down in an easy attitude with his head thrown up in the air so that the antlers rest on the shoulders, and the back forms an even surface for a handle, which is too small to be grasped by an ordinary European hand; in a third a man stands close to a horse's head, and on the other side of the same cylinder are two heads of bisons drawn with sufficient clearness to ensure recognition by any one who has seen that animal. On a fourth the natural curvature of one of the tines has been taken advantage of by the artist to engrave the head and the characteristic recurved horns of the ibex; and on a fifth horses are represented with large heads, upright dishevelled manes, and shaggy ungroomed tails. The most striking figure is that of the mammoth engraved on a fragment of its own tusk; the peculiar spiral curvature of the tusk and the long mane, which are now not to be found in any living elephant, prove that the original was familiar to the eye of the artist. These drawings probably employed the idle hours of the hunter, and hand down to us the scenes which he witnessed in the chase. They are full of artistic feeling and are evidently drawn from life. The mammoth is engraved in its own ivory, and the reindeer and the stag on their respective antlers. The general idea which we are justified in forming of these ancient dwellers in Aquitaine is that they lived by hunting and fishing, and that they were clad with skins sewn together with sinews or strips of intestines. They possessed no domestic animals, nor were they acquainted with spinning or with the potter's art. We have no evidence that they

buried their dead,—the interments, such as those of Aurignac, Les Eyzies, Mentone, as well as of Belgium and Germany, most probably belonging to a later age. Caves containing their implements occur throughout these regions as well as in Switzerland.

These traces of the most ancient men as yet discovered in Europe, may with a high degree of probability be referred to the Eskimos. The bone needles, and many of the harpoons, as well as the flint spearheads, arrowheads, and scrapers, are of precisely the same form as those now in use amongst the Eskimos. The artistic designs from the caves of France, Belgium, and Switzerland, are identical in plan and workmanship with those of the Eskimos, with this difference only, that the hunting scenes familiar to the Palæolithic cave-dwellers were not the same as those familiar to the inhabitants of the shores of the Arctic Ocean. Each represented the animals which he knew, and the whale, walrus, and seal were unknown to the inland dwellers of Aquitaine, just as the mammoth, bison, and wild horse are unknown to the Eskimos. The reindeer, which they both knew, is represented in the same way by both. The practice of accumulating large quantities of the bones of animals round their dwelling-places, and the habit of splitting the bones for the sake of the marrow, are the same in both. The hides were prepared with the same sort of instruments, and the needles with which they were sewn together are of the same pattern. In both there was the same disregard of sepulture. All these facts can hardly be mere coincidences caused by both peoples leading a savage life under similar conditions. The conclusion, therefore, seems inevitable that, so far as we have any evidence of the race to which the cave-dwellers belong, that evidence points only in the direction of the Eskimos. It is to a considerable extent confirmed by a consideration of the animals found in the caves. The reindeer and musk sheep afford food to the Eskimos now in the Arctic Circle, just as they afforded it to the Palæolithic hunters in Europe; and both these animals have been traced by their remains from the Pyrenees to the north-east, through Europe and Asia as far as the very regions in which they now live. The mammoth and bison also have been tracked by their remains in the frozen river gravels and morasses through Siberia as far as the American side of the Straits of Behring. Palæolithic man appeared in Europe with the arctic mammalia, lived in Europe with them, and in all human probability retreated to the north-east along with them.

Ancient Geography of Europe.—The remains of man and the animals described in the preceding paragraphs have been introduced into the caves either by man or the wild beasts, or by streams of water, which may or may not now occupy their ancient courses; and the fact that the same species are to be met with in the caves of France, Switzerland and Britain implies that our island formed part of the Continent, and that there were no physical barriers to prevent their migration from the Alps as far to the north-west as Ireland.

The same conclusion may be gathered from the exploration of caves in the south of Europe, which has resulted in the discovery of African species, in Gibraltar, Sicily, and Malta. In the first of these the spotted hyæna, the serval, and Kaffre cat lie side by side with the horse, grizzly bear, and slender rhinoceros (*R. Hemitechus*),—see Falconer's *Palæontographical Memoirs*. To these African animals inhabiting the Iberian peninsula in the Pleistocene age, M. Lartet has added the African elephant and striped hyæna, found in a stratum of gravel near Madrid, along with flint implements. The hippopotamus, spotted hyæna, and African elephant occur in the caves of Sicily, and imply that in ancient times there was a continuity of land between that spot and Africa, just as the presence of the *Elephas antiquus* proves the

non-existence of the Straits of Messina during a portion, to say the least, of the Pleistocene age. A small species of hippopotamus (*H. Pentlandi*) occurs in incredible abundance in the Sicilian caves. It has also been found in those of Malta along with an extinct pigmy elephant species (*E. Melitensis*). It has also been discovered in Candia and in the Peloponnese. For these animals to have found their way to these regions, a continuity of land is necessary. The view advanced by Dr Falconer and Admiral Spratt, that Europe was formerly connected with Africa by a bridge of land extending southwards from Sicily, is fully borne out by these considerations. The present physical geography of the Mediterranean has been produced by a depression of land to the amount of about 400 fathoms, by which the Sicilo-African and Ibero-African barriers have been submerged, and Crete and Malta separated from the South-European continent. It is extremely probable that this submergence took place at the same time that the adjoining sea bottom was elevated to about the same amount to constitute that region now known as the Sahara.

Pleistocene Caves of the Americas and Australia.—The Pleistocene caverns of the Euro-Asiatic continent contain the progenitors of the animals now to be found in some parts of the Old World, the extinct forms being closely allied to those now living in the same geographical provinces. Those of Brazil and of Pennsylvania present us with animals whose nearest analogues are to be found in North and South America, such as sloths, armadillos, and agoutis. Those, again, of Australia present us with marsupials only, allied to, or identical with, those of that singular continent.

The extinct forms in each case are mainly those of the larger animals, which, from their large size, and the fact of their only bearing one at a birth, would be specially liable to be beaten in the battle for life by their smaller and more fertile contemporaries, and less likely to survive those changes in their environment which have undoubtedly taken place in the long lapse of ages. It is, therefore, certain that the mammalian life in the Old, New, and Australian worlds was as well marked out into geographical provinces in the Pleistocene age as at the present time, and that it has been continuous in these areas from that remote time to the present day.

For caves of America see Lund, *Chron. des Sc. Nat.*, 2d ser., xiii. p. 313; *American Journ. of Science and Art*, i. 1871. For those of Australia—Owen, *Brit. Ass. Rep.*, 1844; Mitchell, *Three Expeditions into Interior of Australia*, 1838, vol. ii.; Wood's *Geological Observations in South Australia*, 1862.

The fact that no caves contain remains more ancient than the Pleistocene age may be explained by the view that the caverns in which the animals of former periods took shelter have been removed by the process of subaerial denudation operating through long periods of time.

Prehistoric Caves of Neolithic Age in Europe.—The prehistoric caves are distinguished from Pleistocene by their containing the remains of domestic animals, and by the wild animals to which they have afforded shelter belonging to living species. They are divisible into three groups according to the traces of man which occur in them,—into the Neolithic, Bronze, and Iron ages.

The Neolithic caves are widely spread throughout Europe, and have been used as the habitations and tombs of the early races who invaded Europe from the East with their flocks and herds. The first of these systematically explored was at Perth Chwareu, near the village of Llandegla, Denbighshire, in 1869. In the following years five others were discovered close by, as well as a second group in the neighbourhood of Cefn on the banks of the Elwy. They contained polished celts, flint flakes,

rude pottery, and human skeletons, along with the broken bones of the pig, dog, horse, Celtic shorthorn, and goat. The remains of the wild animals belong to the wolf, fox, badger, bear, wild boar, stag, roe, hare, and rabbit. Most of the bones were broken or cut, and the whole group was obviously an accumulation which resulted from these caves having been used as dwellings. They had subsequently been used for burial. The human skeletons in them were of all ages, from infancy to old age; and the interments had been successive until each became filled. The bodies were buried in the contracted posture which is so characteristic of Neolithic interments generally. The men to whom these skeletons belonged were a short race, the tallest being about 5 feet 6 inches, and the shortest 4 feet 10 inches; their skulls are orthognathic, or not presenting jaws advancing beyond a vertical line dropped from the forehead, in shape long or oval, and of fair average capacity. The face was oval, and the cheek bones were not prominent. Some of the individuals were characterized by a peculiar flattening of the shinbone (platycnemism), which probably stood in relation to the free action of the foot that was not hampered by the use of a rigid sole or sandal. This, however, cannot be looked upon as a race character, or as a tendency towards a simian type of leg. These Neolithic cave-dwellers have been proved to be identical in physique with the builders of the cairns and tumuli which lie scattered over the face of Great Britain and Ireland. (See Thurnam, *Crania Britannica*.) They have also been met with abundantly in France. In the Caverne de l'Homme Mort, for example, in the department of Lozère, explored in 1871, the association of remains was of precisely the same nature as those mentioned above, and the human skeletons were of the same small type. The same class of remains has also been discovered in Gibraltar, in the caves of Windmill Hill, and some others. The human remains examined by Professor Busk are of precisely the same type as those of Denbighshire. In the work of Don Manuel Gongora J. Martinez (*Antigüedades Prehistóricas de Andalucía*, 1868), several interments are described in the cave of Murcielagos, which penetrates the limestone out of which the grand scenery of the southern Sierra Nevada has been to a great extent carved. In one place a group of three skeletons was met with, one of which was adorned with a plain coronet of gold, and clad in a tunic made of esparto grass finely-plaited, so as to form a pattern like that on some of the gold ornaments in Etruscan tombs. In a second spot further within, twelve skeletons formed a semicircle round one covered with a tunic of skin, and wearing a necklace of esparto grass, earrings of black stone, and ornaments of shell and wild boar tusk. There were other articles of plaited esparto grass, such as baskets and sandals. There were also flint flakes, polished-stone axes, implements of bone and wood, together with pottery of the same type as that from Gibraltar. The same class of remains have been discovered in the Woman's Cave, near Alhama in Granada. From the physical identity of the human remains in all these cases it may be inferred that in the Neolithic age a long-headed, small race inhabited the Iberian peninsula, extending through France, as far north as Britain, and to the north-west as far as Ireland,—a race considered by Professor Busk "to be at the present day represented by at any rate a part of the population now inhabiting the Basque provinces." This identification of the ancient Neolithic cave-dwellers with the modern Basque-speaking inhabitant of the Western Pyrenees is corroborated by the elaborate researches of M. Brocas, Professor Virchow, and Dr Thurnam into modern Basque skulls. It may therefore be concluded that in the Neolithic age an Iberian population occupied the whole of the area mentioned above, inhabiting

caves and burying their dead in caves and chambered tombs, and possessed of the same habits of life. The remains of the same small, oval-featured, long-headed race have been found in Belgium in the cave of Chanvaux.

There is no evidence that any other race except the Iberic buried their dead in the caves of Britain. In Belgium, however, the exploration of the cave of Sclaig-neaux by M. Soreil proves that broad-headed men of the type defined by Professor Huxley and Dr Thurnam as brachycephalic, and characterized by high cheek bones, projecting muzzles, and large stature, the average height being 5 ft. 8.4 inches (Thurnam), inhabited and buried their dead in the caves of that region. In France they occur in the sepulchral cave of Orrony (Oise) in association with those of the Iberic type. They have also been met with in Gibraltar. This type is undistinguishable from the Celtic or Gaulish, found so abundantly in the chambered tombs of the Neolithic age in France. Both these ancient races are represented at the present day by the Basques and Aquitanians of France and Spain, and by the Celts or Gauls of France, Britain, and the Mediterranean border of Spain, their relative antiquity being proved by an appeal to their history and geographical distribution. For just as the earliest records show that the Iberic power extended as far north as the Loire, and as far east as the Rhone, so we have proof of the gradual retrocession of the Iberic frontier southwards, under the attacks of the successive Celtic hordes, until ultimately we find the latter in possession of a considerable part of Southern Spain, forming by their union with the conquered the powerful nation of Celt-Iberi. The Iberians were in possession of the Continent before they were dispossessed by the Celts; they are recognized by Tacitus in Britain in the Silures of Wales; and they are still to be seen in the small, dark, lithe inhabitants of North Wales (see Dawkins, *Fortnightly Review*, October 1874). From the present distribution of this non-Aryan race it is obvious that they were gradually pushed back westward by the advance of tribes coming from the East, and following those routes which were subsequently taken by the Low and High Germans.

The exploration of the Grotta dei Colombi, in the island of Palmaria overlooking the Gulf of Spezzia, in 1873, proves that the stories scattered through the classical writers, that the caves on the Mediterranean shores were inhabited by cannibals, are not altogether without foundation. In it broken and cut bones of children and young adults were found along with those of the goat, hog, fox, wolf, wild cat, flint flakes, bone implements, and shells perforated for suspension.

Prehistoric Caves of Bronze and Iron Ages.—The extreme rarity of articles of bronze in the European caves implies that they were rarely used by the Bronze folk for habitation or burial. Bronze weapons mingled with gold ornaments have, however, been discovered in the Heatheryburn Cave near Stanhope, Durham, as well as in those of Kirkhead in Cartmell, in Thor's Cave in Staffordshire, and the Cat Hole in Gower in Glamorganshire. In the Iberian peninsula the Cave of Cesareda, explored by Signor Delgado, in the valley of the Tagus, contained bronze articles, associated with broken and cut human bones, as well as those of domestic animals, rendering it probable that cannibalism was practised in early times in that region. Professor Busk believes, however, that the facts are insufficient to support the charge of cannibalism against the ancient Portuguese.

Caves containing articles of iron, and therefore belonging to that division of the prehistoric age, are so unimportant that they do not deserve notice in this place. As man increased in civilization he preferred to live in houses of his own building, and he no longer buried his dead in the natural sepulchres provided for him in the

Prehistoric caves have been rarely explored in extra-European areas. Among those which abound in Palestine, one in Mount Lebanon, examined by the Rev. Canon Tristram, contained flint implements along with charcoal and broken bones and teeth, some of which may be referred to a small ox, undistinguishable from the small short-horn, *Bos longifrons*. In North America the remains found by Mr. F. W. Putnam in the caves of Kentucky, consisting of moccasins, rudely plaited cloth, and other articles, may be referred to the same division.

Historic Caves in Britain.—The historic caves have only attracted notice during the last few years, and in Britain alone, principally through the labours of the Settle Cave Committee from the year 1869 to the present day. To them is due the exploration of the Victoria Cave, which had been discovered and partially investigated as early as the year 1838. It consists of three large ill-defined chambers opening on the face of the cliff 1450 feet above the sea, and filled with *débris* very nearly up to the roof. It presented three distinct eras of occupation,—one by hyænas, which dragged into it rhinoceroses, bisons, mammoths, horses, reindeer, and bears. This was defined from the next occupation, which is probably of the Neolithic age, by a layer of gray clay, on the surface of which rested a bone harpoon and a few flint flakes and bones. Then after an interval of *débris* at the entrance was a layer of charcoal, broken bones, fragments of old hearths, and numerous instruments of savage life associated with broken pottery, Roman coins, and the rude British imitations of them, various articles of iron, and elaborate personal ornaments, which implied a considerable development of the arts. The evidence of the coins stamps the date of the occupation of the cave to be between the first half of the 5th century and the English invasion. Some of the brooches present a peculiar flamboyant and spiral pattern in relief, of the same character as the art of some of the illuminated manuscripts, as for example one of the Anglo-Saxon gospels at Stockholm, and of the gospels of St Columban in Trinity College, Dublin. It is mostly allied to that work which is termed by Mr Franks late Celtic. From its localization in Britain and Ireland, it seems to be probable that it is of Celtic derivation; and if this view be accepted, there is nothing at all extraordinary in its being recognized in the illuminated Irish gospels. Ireland, in the 6th and 7th centuries, was the great centre of art, civilization, and literature; and it is only reasonable to suppose that there would be intercourse between the Irish Christians and those of the west of Britain, during the time that the Romano-Celts, or Brit-Welsh, were being slowly pushed westwards by the heathen English invader. Proof of such an intercourse we find in the brief notice of the *Annales Cambriæ*, in which Gildas, the Brit-Welsh historian, is stated to have sailed over to Ireland in the year 565 A.D. It is by no means improbable that about this time there was a Brit-Welsh migration into Ireland, as well as into Brittany. Objects with these designs found in Germany are probably directly or indirectly due to the Irish missionaries, who spread Christianity through those regions. The early Christian art in Ireland grew out of the late Celtic, and is to a great extent free from the influence of Rome, which is stamped on the Brit-Welsh art of the same age in this country.

Several other ornaments with enamel deserve especial notice. The enamel composed of red, blue and yellow has been inserted into the hollows in the bronze, and then heated so as to form a close union with it. They are of the same design as those which have been met with in late Roman tumuli in this country, and in places which are mainly in the north. They all belong to a class named late Celtic by Mr Franks, and are considered by him to be

of British manufacture. This view is supported by the only reference to the art of enamelling furnished by the classical writers. Philostratus, a Greek sophist in the court of Julia Domna, the wife of the Emperor Severus, writes, "It is said that the barbarians living in the ocean pour these colours (those of horse-trappings) on heated bronze, and that these adhere, grow as hard as stone, and preserve the designs that are made in them." It is worthy of remark that, since the Emperor Severus built the wall which bears his name, marched in person against the Caledonians, and died at York, the account of the enamels may have reached Philostratus from the very district in which the Victoria Cave is situated.

Associated with these were bronze ornaments inlaid with silver, and miscellaneous iron articles, among which was a Roman key. Remains of this kind have been met with in the Albert and Kelko caves in the neighbourhood, in that of Dowkerbottom near Arncliffe, in that of Kirkhead on the northern shore of Morecombe Bay, in Poole's Cavern near Buxton, and in Thor's Cave near Ashbourne.

It is obvious in all these cases that men accustomed to luxury and refinement were compelled, by the pressure of some great calamity, to flee for refuge to caves with whatever they could transport thither of their property. The number of spindle-whorls and personal ornaments imply that they were accompanied by their families. We may also infer that they were cut off from the civilization to which they had been accustomed, because in some cases they extemporized spindle-whorls out of fragments of Samian ware, instead of using those which were expressly manufactured for the purpose. Why the caves were inhabited is satisfactorily explained by an appeal to contemporary history. In the pages of Gildas, in the *Anglo-Saxon Chronicle*, and in the *Annâles Cambriæ*, we have a graphic picture of that long war of invasion by which the inhabitants of the old Roman province of Britannia were driven back by the Jutes, Angles, and Saxons, who crossed over with their families and household stuff. Slowly, and in the chances of a war which extended through three centuries, they were gradually pushed back into Cumberland, Wales, and West Somerset, Devon, and Cornwall. While this war was going on the coinage became debased and Roman coins afforded the patterns for the small bronze minimi, which are to be met with equally in these caves

and in the ruins of Roman cities. As the tide of war rolled to the west, the English tongue and, until towards the close of the struggle, the worship of Thor and Odin supplanted the British tongue and the Christian faith, and a rude barbarism replaced what was left of the Roman civilization in the island. It is to this period that relics of this kind in the caves must be assigned. They are traces of the anarchy of those times, and complete the picture of the desolation of Britain, revealed by the ashes of the cities and villas that were burnt by the invader. They prove that the vivid account given by Gildas of the straits to which his countrymen were reduced were literally true. The historic caves of the Continent have not as yet been explored.

CAVE, EDWARD (1691–1754), an English printer, was born at Newton in Warwickshire, in 1691. He was placed by his father, who was a shoemaker at Rugby, at the famous school of that town, but being accused of robbing the hen-roost, he was forced to leave. He became clerk to a collector of the excise; but the drudgery and insolence to which he was subjected by his master's wife caused him to try his fortunes in London, and after having been engaged for some time by a timber-merchant, he was finally bound apprentice in the printing-office of Mr Collins. In two years he attained so much skill in his art, that he was sent to conduct a printing-house at Norwich, and publish a weekly paper. In this undertaking he met with some opposition, which produced a public controversy, and procured young Cave the reputation of a writer. The only work of any size, however, which he left was *An Account of the Criminals*. He held for a short time the office of clerk of the franks, but his rigour in checking abuses soon caused his dismissal. He now embarked the capital which he had acquired in the publication of the *Gentleman's Magazine*, a periodical which procured a fortune for the projector, and survived almost all its competitors. It is as the founder of this magazine, and as the first to give literary employment to Samuel Johnson, that Cave's name has been remembered. He died on the 10th January 1754. Dr Samuel Johnson wrote a short biography of Cave.

CAVE, DR WILLIAM (1637–1713), an English divine, was born at Pickwell in Leicestershire. He was educated at St John's College, Cambridge, and became successively minister of Hasely in Oxfordshire, of All-Hallows the Great of Islington in London, and of Isleworth in Middlesex. He was chaplain to Charles II., and in 1684 was installed as a canon of Windsor. The two works on which his reputation principally rests are the *Apostolici*, or History of Apostles and Fathers in the three first centuries of the church (1677), and *Scriptorum Ecclesiasticorum Historia Literaria* (1688). The best edition of the latter is the Clarendon Press, 1740–3, which contains additions by the author and others. In both works he was drawn into controversy with Leclerc, who was then writing his *Bibliothèque Universelle*, and who accused him of partiality.

Besides these, he wrote *Primitive Christianity, or Religion of the Ancient Christians, &c.*; *Tubule Ecclesiasticæ; Antiquitates Apostolicæ; A Dissertation concerning the Government of the Ancient Church, &c.*; *Ecclesiastici, or History of the Fathers of the 4th century*; and a work entitled *Charthophylæ Ecclesiasticæ*, which is an abridgment of the *Historia Literaria*.

CAVEDONE, JACOPO (1577–1660), an Italian painter, born at Sassuolo in the Modenese, was educated in the school of the Caracci, and under them painted in the churches of Bologna. His principal works are the Adoration of the Magi, the Four Doctors, and the Last Supper; and more especially the Virgin and Child in Glory, with San Petronio and other saints, painted in 1614, and now in the Bolognese Academy. Cavedone became an assistant to Guido in Rome; his art was generally of a subdued undemonstrative character, with rich Titianesque colouring. In his declining years his energies broke down after the death of a cherished son; and he died in extreme poverty, in a stable in Bologna.

CAVENDISH, HENRY (1731–1810), a chemist and natural philosopher, was the son of Lord Charles Cavendish, brother of the third duke of Devonshire, and of Lady Anne Grey, daughter of the duke of Kent. He was born at Nice on the 10th October 1731. Little is known about his early education. He was for some time at Newcombe's school at Hackney, and afterwards went to Cambridge. Probably his taste for experimental research was mainly acquired from his father, who gave some attention to meteorological observations, and whose very accurate determination of the depression of mercury in barometrical tubes has formed the basis of some of the most refined investigations of modern times. The morbid sensibility of his nature, which led him to shrink from society, would also have an influence in determining his choice of a scientific life; and he was free to follow his bent, as his allowance from his father was amply sufficient for his wants, and a large inheritance left him by one of his uncles put him in possession of abundant means for prosecuting his scientific investigations. In the latter part of his life, indeed, he was not less famed in his country for the great accumulation of his property than for his intellectual and scientific treasures. His merits in science were more generally understood on the Continent; and he was made, though not till he had passed the age of seventy, one of the eight foreign associates of the Institute of France. He resided principally at Clapham Common, but his library was latterly at his house in Bedford Square; and after the death of his librarian, he appointed a day on which he attended in person to lend any work to such men of letters as were either personally known to him or recommended by his friends. So methodical was he that he never took down a book for his own use without entering it in the loan book. In 1760 he became a member of the Royal Society. He was constantly present at the meetings of the society, as well as at the conversations held at the house of the president; and he dined every Thursday with the club composed of its members. Otherwise he had little intercourse with society, even with his own family. He saw only once a year the person whom he had made his principal heir. His dinner was ordered daily by a note placed on the hall table, and his female domestics had orders to keep out of his sight on pain of dismissal. His person was tall and rather thin; his dress was singularly uniform, although sometimes a little neglected. He had a slight hesitation in his speech, and an air of timidity and reserve that was almost ludicrous. He died unmarried on the 24th of February 1810, leaving a property in the funds of about £700,000, and a lauded estate of £6000 a year. Some of his warmest admirers have expressed regret that no portion of that vast wealth was appropriated to scientific objects.

For almost fifty years after Cavendish became a member of the Royal Society, he continued to contribute to the *Philosophical Transactions* some of the most interesting and important papers that have appeared in that collection; in which the precision of experimental demonstration, no

less than the important scientific facts communicated, has been thought to have aided the further progress of chemical discovery. He may almost be called the founder of pneumatic chemistry, which had barely an existence when he began his researches. In a series of "Three papers, containing Experiments on Factitious Air," *Phil. Trans.*, 1766, p. 141, he describes the apparatus used in processes of this kind, which he had improved by the occasional employment of mercury. By weighing a bladder filled with a known bulk of inflammable air (hydrogen), and then in a state of collapse, and by examining the loss of weight during the solution of zinc in an acid, he found the specific gravity of inflammable air to be about $\frac{1}{11}$ th of that of common air, a discovery which led to balloon experiments and projects for aerial navigation. He also observed that the gas obtained during the solution of copper in muriatic acid was rapidly absorbed by water, but did not inquire further into its nature. The second paper refers to fixed air (carbonic acid), which was found to undergo no alteration in its elasticity when kept a year over mercury, to be absorbed by an equal bulk of water or of olive oil, and by less than half its bulk of spirit of wine, to exceed the atmospheric air in specific gravity by more than one-half, and to render it unfit for supporting combustion even when added to it in the proportion of only 1 to 9. In the third part, the air produced by fermentation and putrefaction is examined, and is shown to be identical with the fixed air obtained from marble. It is also shown that the inflammable air emitted during putrefaction resembles that which is procured from zinc, although it appears to be a little heavier.

A paper on "Experiments on Air," *Phil. Trans.*, 1784, p. 119, contains an account of two of the greatest discoveries that have ever been made in chemistry,—the composition of water, and that of nitric acid. Cavendish first establishes the radical difference of hydrogen from nitrogen, and then relates his experiments on the combustion of hydrogen with oxygen, which had partly been suggested by an observation of Mr Waltire, a lecturer on natural philosophy, and which prove that pure water is the result of the process, provided that no nitrogen be present. The second series of experiments shows that when phlogisticated air (nitrogen) is present in the process, some nitric acid is produced, and that this acid may be obtained from atmospheric air, by the repeated operation of the electrical spark. In another paper on "Experiments on Air," *Phil. Trans.*, 1785, p. 372, the composition of nitric acid is further established, and it is shown that nearly the whole of the irrespirable part of the atmosphere is convertible into this acid, when it is mixed with oxygen and an electric spark is passed through the mixture,—the fixed air sometimes obtained being due to the presence of organic substances.

Besides the above, Cavendish contributed a number of other papers to the *Philosophical Transactions*. In an "Account of a New Eudiometer," *Phil. Trans.*, 1783, p. 106, he attributes the great difference in the results of eudiometrical experiments with nitrous gas, or nitric oxide, to the different degrees of oxygenization of the acid that is formed. But he found that when the method employed was the same, there was no sensible difference in the constituent parts of the atmosphere under circumstances the most dissimilar,—the air of London, with all its fires burning in the winter, appearing as pure as the freshest breezes of the country. In "An Attempt to explain some of the principal Phenomena of Electricity by means of an Elastic Fluid," *Phil. Trans.*, 1771, p. 584, his theory of electricity agrees with that which had been published a few years before by Æpinus, but he has entered more minutely into the details of calculation. The law of electric attraction

and repulsion had not at that time been fully ascertained, but Cavendish inclines to the true supposition, of forces varying inversely as the square of the distance. In his "Observations on Mr Hutchin's Experiments for determining the degree of cold at which quicksilver freezes," *Phil. Trans.*, 1783, p. 303, he denied to heat the character of a substance, and thought "Sir Isaac Newton's opinion, that heat consists in the internal motion of the particles of bodies, much the most probable,"—a view which it was one of the first of Sir Humphrey Davy's objects to confirm. The apparatus which Cavendish employed in his "Experiments to determine the density of the Earth," *Phil. Trans.*, 1798, p. 469, had been invented and constructed many years before by the Rev. John Michell, who did not live to perform the experiments for which he intended it. The method employed was to suspend by a vertical wire a horizontal bar, having a leaden weight at each end; to determine the magnitude of the force of torsion by the time occupied in the lateral vibrations of the bar; and to measure the extent of the change produced in its situation by the attraction of two large masses of lead placed on opposite sides of the case containing the apparatus, so that this attraction might be compared with the weight of the balls, or, in other words, with the attraction of the earth. In this manner the mean density of the earth was found to be five and a half times as great as that of water.

There has been some difference of opinion as to the attitude of Cavendish towards the antiphlogistic theory of Lavoisier. Cavendish by no means dissented from the whole of that theory. In the "Experiments on Air," *Phil. Trans.*, 1784, he quotes Lavoisier and Scheele with approbation, as having suggested the opinion "that dephlogisticated air and phlogisticated air are quite distinct substances, and that common air is a mixture of the two." Afterwards he says that "not only the foregoing experiments, but most other phenomena of nature, seem explicable as well, or nearly as well, upon this as upon the commonly believed principle of phlogiston." M. Cuvier has even asserted that the antiphlogistic theory derived its first origin from one great discovery of Cavendish, that of the nature of hydrogen, and owed its complete establishment to another, that of the composition of water.

Cavendish possessed a clearness of comprehension, and an acuteness of reasoning, which had been the lot of very few of his predecessors from the days of Newton. The splendid career of chemical investigation, which has since been pursued with a degree of success unprecedented in history, may be said to have been first laid open to mankind by his labours.

CAVENDISH, MARGARET. See NEWCASTLE, DUCHESS-OF.

CAVENDISH, THOMAS (1560–1592), the third circumnavigator of the globe, was born at Trimley St Mary, in Suffolk, in 1560. For a short time he studied at Corpus Christi College, Cambridge, but quitting the university without a degree, he followed the court, and in a few years squandered away nearly all his inheritance. Turning his attention to maritime adventure with a view to repairing his fortune, he fitted out a ship in which he accompanied the expedition sent to Virginia in 1585 under the command of Sir Richard Grenville. On his return he resolved upon a predatory expedition against the Spaniards in the New World. Accordingly, on July 21, 1586, he sailed from Plymouth with three small vessels, passed through the Straits of Magellan, cruised along the coasts of Chili, Peru, and Mexico, and burnt and sunk nineteen ships, including the "Santa Anna," a vessel belonging to the king of Spain, with a cargo of immense value, which he captured off the coast of California. Returning home with his plunder by the Cape of Good Hope he reached Plymouth,

September 9, 1588, having circumnavigated the globe in two years and fifty days. It is said that his sailors were clothed in silk, his sails were damask, and his topmast covered with cloth of gold. His hastily-acquired riches did not last long, for in 1591 he had reduced himself to the necessity of undertaking another expedition with five vessels. This voyage was a most disastrous one. His crews were mutinous, and after leaving the Straits of Magellan they obliged him to steer for England. At this he became dispirited, and died of grief on the homeward voyage in 1592. The only geographical discovery of any importance which can be attributed to Cavendish is that of the harbour named by him Port Desire, on the east coast of Patagonia.

CAVENDISH, SIR WILLIAM, the second son of Thomas Cavendish of Cavendish in Suffolk, clerk of the pipe in the reign of Henry VIII., was born about the year 1505. Having received a liberal education, he was taken into the family of Cardinal Wolsey, whom he served in the capacity of gentleman-usher of the chamber. Cavendish was with Wolsey when he died, and delayed going to court till he had seen his remains decently interred. The king was so far from disapproving of his conduct that he immediately took him into his household, made him treasurer of his chamber and a privy-counsellor, and afterwards conferred on him the order of knighthood. He was also appointed one of the commissioners for receiving the surrender of religious houses. In 1540 he was nominated one of the auditors of the court of augmentations, and soon afterwards obtained a grant of several considerable lordships in Hertfordshire. In the reign of Edward VI. his estates were much increased by royal grants in seven different counties; and he appears to have continued in high favour at court during the reign of Queen Mary. He died in 1557. Sir William was the founder of Chatsworth, and of the vast fortunes of his descendants, the dukes of Devonshire. He wrote *The Life and Death of Cardinal Wolsey*, of which a mutilated copy appeared in 1641. It was first correctly printed in Dr Wordsworth's *Ecclesiastical Biography*.

CAVENDISH, WILLIAM, first duke of Devonshire. See DEVONSHIRE, DUKE OF.

CAVITE, a fortified seaport town of the Philippines, capital of a province of the same name in the Island of Luzon, nine miles south of the city of Manila, on a tongue of land in the bay. It was formerly the head naval depôt of the Spanish possessions in the East, and has an arsenal, a hospital, two churches, and three convents.

CAVORE, or **CAVOUR**, a town of Italy in the province of Turin, 25 miles south-west of the city of that name. It carries on silk-spinning and linen-weaving, as well as a trade in grain. In 1433 it was bestowed by Amadeus VIII. of Savoy on the lords of Raconis, and in the 16th and 17th centuries it appears from time to time in the various wars and revolutions. In more recent days it has given its name to the great statesman of Italy whose family were raised to the marquisate of Cavour in the middle of the last century. An earthquake did considerable damage to the town in 1808. Population, 7380.

CAVOUR, COUNT (1810-1861). Camillo Benso di Cavour, the regenerator of Italy, and one of the greatest of modern statesmen, was born at Turin on the 1st of August 1810. The family of the Bensi was a very ancient one. The founder of it, a Saxon warrior named Hubert, after following Barbarossa in his Italian wars, and making a pilgrimage to the Holy Land, married a Piedmontese heiress about the middle of the 12th century, and settled on the very estate of Santena where the remains of his great descendant were lately laid. In the early part of their history, the Bensi seem to have been connected with the

small neighbouring republic of Chieri, later with the House of Savoy, which gradually gained the upper hand in those parts of Northern Italy. Their life, like that of other feudal barons, was stirring, rough-handed, and adventurous. Members of the family are frequently to be met with in history, but none of them eminent enough to deserve mention here. In the middle of last century the head of the Bensi was raised to the dignity of marquis, under the name of Cavour. Accordingly, at the beginning of this century we find the father of the great statesman in possession of the title of marquis. He had married a Genevese lady of rank, and both held offices in the household of the Prince Borghese, husband of the Princess Pauline, the beautiful sister of Napoleon, who was governor of Piedmont in those days when Europe lay at the feet of the French conqueror. Under these circumstances was the future deliverer of Italy born, the second son of this Piedmontese nobleman and of his Genevese wife. The Princess Pauline, the sister of one Napoleon, and aunt of another, who have so powerfully influenced the destinies of Italy, presented the infant Camillo at the font.

Cavour spent the first ten years of his life in his father's house at Turin, enjoying all the advantages which favour the full and genial development of both mind and body. The old marquis, who became a decided conservative after the Revolution, was a wise and benevolent father, and an upright man. He enjoyed the care, too, of an accomplished mother, of a grandmother still more accomplished, and of two aunts, who, having no children of their own, naturally bestowed all their affection on him and his elder brother. For some time he had no love for his lessons; in fact, he had a perfect horror of them. The probability is that the buoyancy and energy of his nature made him averse to such restraint. He was an active, energetic boy, full of animal spirits and never tired of play, strong of will, yet genial and good-natured. In a little time he became a voracious reader, but as full of frolic as ever. At ten years of age Camillo, being intended for the army, left home to enter the military academy. There he studied hard, especially mathematics. As he afterwards regretted, the literary side of his education had been neglected,—perhaps because he had never been attracted to literature by any of those circumstances which call forth a dormant power, perhaps because the original bent of his mind was too strong towards the clear and the utilitarian. Mathematics satisfied his love for definite statement and clear demonstrative argument. He had no inclination towards metaphysics, had little imagination, and was never tempted to run after vague ideals. The only speculations he indulged in were social, political, or industrial, those, in fact, which are closely connected with tangible and positive interests. But his after career as plainly shows that he was capable of a deep and absorbing enthusiasm, which was all the more powerful and effective, because disciplined by a sure judgment and a wise patience.

Anyhow, he was a very successful student in the subjects taught at the military academy. This is proved by the fact, that he was appointed to a commission in the engineers at the age of sixteen, though by the rules of the service it was not under twenty such a post could be granted.

At the military academy an incident occurred which is a clear indication of his character, and helped greatly to determine his future career. Being the son of a noble family, he was honoured with the dignity of page in the royal household. An ordinary boy would have been highly delighted with this introduction to court life; but to Cavour its restraints, its etiquette, and its livery were a galling load, and, as he was by no means ready to learn the lessons of what is called a wise reticence, he was soon

relieved of the honour, and marked as a dangerous fellow. During his brief military career he seems to have been stationed mostly at Genoa. This was a more independent life than he had hitherto led; and at Genoa, where the liberal element was naturally stronger than at the court and capital, young Cavour felt himself more at his ease than ever he had been at Turin. But when the shock of the French Revolution of the year 1830 began to be felt in Italy, and when men thought themselves at liberty once more to express their opinions on the state of their native country, Cavour was soon caught offending by the same excessive freedom of speech. He was sent, therefore, in a kind of honourable banishment to Fort Bard in the Val d'Aosta, nominally to superintend some mason-work there, but really as a chastisement for his imprudence, and in the hope of a course of solitary reflection leading him at last to acquiesce in the existing state of things. Here Cavour was reduced to great straits for want of society, being obliged to while away his time at a certain game of tarots with the contractors. After six months he grew weary of it, and sent in his resignation (1831).

He had now reached a most important turning-point in his career. Set adrift from the profession for which he had been educated, and suspected at court, there were three courses open to him,—to retire into private life in Piedmont, or to go abroad and quietly await a favourable opportunity for taking part in the deliverance of his country, or to join in the frequent conspiracies of the Carbonari and others for its immediate emancipation. The state of Italy was such as to justify the most extreme methods. He was now arrived at a time of life at which he could realize the full measure of the sufferings and humiliations his country had undergone. Endowed with the all too fatal gift of beauty, and covered with a population, which has excelled in every department of human activity, in arts and literature, in commerce and navigation, but was too disunited and far too demoralized to defend her, Italy had for centuries been the prey of every spoiler, of the Saracen and the German, the Frenchman and the Spaniard. Her national life had been repressed, her commerce ruined, her intellectual growth stifled, and the very soul of her people debased and perverted by priestcraft and foreign despotism. To most other nations their native land was an object of pride and affection, to the Italians Italy was the theme of shame and burning tears. The entrance of the armies of Republican France into Italy had been greeted as the dawn of deliverance, but in a little time their deliverers proved themselves to be only new masters. Yet the French occupation had the good effect of diffusing the liberal ideas of the French thinkers, and of accustoming the Italians to a comparatively just and well-ordered government, so that the desire for national regeneration became more ardent than ever. Then came the Peace of Vienna, which gave Austria direct or indirect rule over the whole of Italy, and in 1820 the rising in Naples and Piedmont, which furnished that power with the pretext of armed intervention, and the excuse for rivetting still faster the chains of the enslaved. At this period, then, the prospects of Italian liberty seemed darker than ever. Even Sardinia, though preserved from the worst reactionary extreme by the hatred of Austria, had been compelled to yield to the prevailing current. Charles Albert himself, the leader of the rising in Piedmont in 1821, was fain to atone for his liberal courses by joining in the worst measures of the reaction, and, when he ascended the throne in 1831, was instructed that he held his place only on his good behaviour. In fact, from the beginning of his reign to 1847, when the revolution recommenced, he was only the nominal ruler of Sardinia; his ministers were the creatures of Austria, and received their instructions from Metternich. It is necessary to

remember these circumstances if we are to appreciate rightly the services of Cavour. We must compare the Italy he has made not with countries which have for centuries had a free development of their national life, but with Italy of 1820 or 1830, with Italy oppressed, demoralized, and disunited, while the noblest of her sons languished in Austrian prisons, or fretted their lives away in exile or in vain conspiracy. In these circumstances, Cavour, a youth of twenty, might have been led to join the secret societies which, under the direction chiefly of Mazzini, waged ceaseless war against the oppressors of Italy. From this his good sense happily saved him. Though prophetically aware of the near advent of democracy as the ruling power in the world, he saw that conspiracies could not deliver Italy, that fitful plots backed by irregular bands were useless against a regular Government supported by veteran armies, and that fretful outbreaks would only irritate Austria and excuse further oppression without doing her any real injury. Being, therefore, unable to tolerate the policy of the clerical and aristocratic party of the time, and entirely disapproving of the methods of the Carbonari and "Young Italy," he saw that the best course in politics was a watchful inactivity. For sixteen years he was obliged to wait in private life, a keen and patient observer, acquiring that ripe and comprehensive wisdom which should fit him to be an effective servant of his country. During these long years we find him active in three special ways,—as the skilful promoter of the material interests of his country, especially in agriculture, as a keen student and observer of foreign countries, especially France and England, and as the author of papers in which he embodied some of the results of his observations.

Though, at first, it is said, he could scarcely distinguish between a cabbage and a turnip, he soon made himself complete master of the theory and practice of agriculture, introduced vast improvements on the family estates, and was one of the founders of the Agricultural Society of Piedmont in 1841. So in the application of steam to material and social improvement, in establishing steamers on the Lake Maggiore, in the erection of steam-mills and chemical works, and in the furtherance of railways, as well as in founding the Bank of Turin, he took a leading part. These were good in themselves, but Cavour had a patriotic end in view; he knew that they were the sure basis of national and social improvement, and the best possible introduction to it. In his study of foreign countries, though he had an open, penetrating eye for all phases of their national life, it was with the same continual reference to the good of Italy that he observed and meditated. He was several times at Paris, and at least twice in England, and was perfectly familiar with the language and economic and political condition both of England and of France. Such French statesmen as Guizot and the Duc de Broglie he highly esteemed; and he was always an ardent, though by no means unqualified, admirer of England. In the early part of his public career, when his opposition to the revolutionary fanaticism made him unpopular, the charge of Anglomania was frequently brought against him. During these years, too, he wrote various reviews, all of which give the results of studies bearing on the economic or political questions of the time, and bear, all of them, the impress of that practical moderation and penetration which were such essential elements in his character. These sixteen years were in every sense the training time of Cavour. Under the combined influence of practical experience in the conduct of business, and of philosophic insight into the principles of free government, as exhibited especially in England, he grew into that capable man who should guide Italy through the troubles of a very

trying struggle to the honourable place she now occupies among the free nations of the earth. The years of waiting at length came to an end. Towards the end of 1847 all the provinces of Italy were in a highly-wrought state of revolutionary excitement. Pius IX., the new Pope, had put himself at the head of the movement, and, the clerical and liberal parties being thus united, the most extravagant hopes were entertained. The revolution carried everything before it, threatening only by its growing violence to defeat its own ends. Cavour saw the time for action was come, and, along with his friends Balbo and Santa Rosa, instituted at Turin a newspaper called the *Risorgimento*, as the organ of their common opinions, while, on the promulgation of the new constitution for Sardinia, which he was the first to suggest, he took his seat in the Chamber as one of the members for the capital. Having long meditated on the political situation of Italy, and being perfectly at home on all political questions, he took a decided attitude from the beginning. As a conscientious adherent of the principles of the *juste milieu*, he opposed in the firmest way the irregular fervour of the revolution; and as a practical man, he was ready so far to yield to its fury, in order, by thus yielding, to command it and utilize its strength. In the same way he desired to restrain the violence of the war party; but after the example of Paris had encouraged the people of Milan and Venice to rise against Austria, he saw that the time for political hesitation had gone by, and with all ardour sounded the call to arms. Again, when the reaction had regained the upper hand at Naples, and Radetzki had defeated the Sardinian forces at Custoza, he was convinced that there was no more hope of success, and counselled peace. Still more so after Novara. In the Sardinian Chamber parties rose and fell without changing the attitude of Cavour; resolved on advocating the measures which were for the time most conducive to the good of Piedmont and of Italy, he supported the party that he deemed most likely to carry them out, without regard to its colours. For some time he was one of the most unpopular men in Turin; the advanced party hated him for his moderation, and the conservatives for his liberalism; as a moderate liberal he often stood almost alone. But gradually the real greatness of his character began to appear above the contending elements which surrounded and obscured it. Passing on from those years of excitement and despair, when the hopes of Italy seemed again indefinitely deferred, to the beginning of 1853, when the elections after his first elevation to the premiership took place, we find the extreme left almost annihilated, and the extreme right greatly reduced in members. How had this change taken place? Five years of hard, adverse experience had taught his countrymen that he was right. Opposed to the excesses of the revolution, when the revolution was at its height, and to the pretensions of clericalism, when the revolution was for a time discredited, he was the real fixed point in the ever-shifting chaos, and the elements of confusion gradually gathered round him. Time, that tests all opinion and all character, had proved the soundness of his.

From 1850 to 1852 Cavour was an active member of Azeglio's administration; from 1852 to his death in 1861, he was, except for a short interval, the prime minister and virtual ruler of his country. From 1850 to 1855, when Sardinia began to take part in the Crimean War, the most conspicuous feature in his career was his relation to the church. With his usual penetration he soon perceived that the pretensions of the party now dominant at Rome were utterly incompatible with the rights of a free modern society, and that the only solution of the difficulty was, that the state, while recognizing the right of the church to perfect freedom within the spiritual sphere, should assert

for itself the same freedom within the civil sphere; in his own words, he desired a free church in a free state. While an extreme party counselled the confiscation of the church property, Cavour merely asserted the right of the state to secure a more equitable distribution of it among the clergy. On the question of civil marriage, and of the immunity of the clergy from the civil jurisdiction, he asserted the principle that the state should be absolute master within its own domain; with the spiritual rights of the church he never interfered. Those years were marked, too, by many energetic measures for the material improvement of Sardinia. The principles of free trade were introduced as far as possible, and a more judicious taxation.

Cavour's proposal to join the alliance of the Western powers against Russia met with the most violent opposition from both the extreme parties in the Sardinian Chamber, and even some of the most influential members of his own cabinet threatened to resign. But the king supported him; the country, as a whole, trusted him; and in the spring of 1855 the Sardinian army was on its way to the East. This audacious step of the Sardinian minister, which engaged one of the smallest kingdoms of Europe in a conflict among the greatest empires, caused some doubtful reflections at the various courts. It was understood by all as a bold assertion of Italy; and an Austrian minister declared it a pistol-shot fired at the head of Austria. At first, too, the Sardinian army experienced a hard fortune. It was attacked by cholera, and, for a long time, no opportunity occurred for distinguishing itself on the field of battle. The worst anguries of the opposition seemed destined to be fulfilled, and their fiercest denunciations of an expensive and Quixotic expedition justified, when tidings came of the battle of the Tchernaya. The enthusiasm was universal, the opposition was silenced, and Cavour rose higher than ever in the national estimation.

Then came the peace, considerably to the disappointment of Cavour, who had expected a prolonged war, and perhaps a general state of confusion, in which an adventurous state like Piedmont, that had everything to gain and little to lose, might greatly profit. It was not without great hesitation that he resolved to be present at the Congress of Paris. Yet, when there, he maintained the cause of Italy not less effectively than the Sardinian army had done in the Crimea. In all the questions that turned up he bore himself with such tact, knowing well how far the modesty of his position imposed upon him the duty of silence, and so skilfully brought forward the astonishing resources of a mind deeply versed in European questions, that he was immediately recognized as one of the ablest living diplomatists, and took a place altogether out of proportion to the strength of the kingdom he represented. His most ardent wish was to see the grievances of Italy brought before the Congress. Accordingly, near the end of its sittings, Count Walewski, as president, introduced the subject, pointing out the danger to the European peace of the existing state of things, and suggested that a note should be addressed to the sovereigns of Italy counselling reform. This step took the members by surprise, and as Count Buol, the representative of Austria, protested against the discussion of the question, the matter ended, but not before Cavour had time to plead the cause of Italy. Afterwards, he followed up the advantage he had gained by a memorandum to the same effect addressed to the cabinets of London and Paris. Thus the gains of the war were not slight. The morale of the Piedmontese army had been restored, and the name of Italy, not as a geographical idea, but as a nationality, brought before assembled Europe. Above all, enlightened Italians now felt that they had found a man; no sentimental dreamer of liberty, nor a fanatical

conspirator, but a wise statesman, deeply read in the secrets of European politics, capable of commanding at once the confidence of Italy and the respect of Europe.

What was scarcely less important was, that Napoleon and France had become interested in Italy. Certainly, if Cavour had been free to choose, he would have preferred to inaugurate the regeneration of his country under the auspices of England. Her moral weight was greater, and she was less likely to exact painful sacrifices as the price of her support. His participation in the Crimean struggle had been above all advantageous to England; her liberal traditions and her feelings of gratitude alike led him to hope for her support. But to his chagrin, he found at the Congress that the state of European politics had made England the friend of Austria; and that his advocacy of the union of the Danubian Principalities in opposition to her views had alienated her, he soon found out in the coldness of the English ministers. Still he did not allow himself to be discouraged. He could count on Napoleon; Russia was estranged from Austria, Prussia was her rival in Germany, Hungary was discontented. To isolate Austria, to make friends of her enemies and rivals, to regain the goodwill of England,—this was now the policy of Cavour. The hostility of Sardinia to Austria became every day more apparent and more provoking. The armaments of Sardinia, far too great for the resources or the ordinary requirements of the country, pointed to war as the only solution of standing difficulties. Accordingly, at Plombières, in the autumn of 1858, the programme of the war of 1859 was made out by the French Emperor and Cavour.

These were times of almost preternatural activity for Cavour. At one period or other he had filled almost every office in the administration; but in a crisis like the present, the constitution was suspended, and the prime minister became a kind of dictator, taking upon himself the entire government of the country, home and foreign affairs, and the ministry at war, as well as finance. The crisis was worthy of such a supreme effort, for bitterly disappointed as Cavour and the Italians were at the peace of Villafranca, the power of Austria in the peninsula had been broken, and Italy thenceforward had her destiny in her own hands.

On the conclusion of peace Cavour had resigned, but he returned to his post in January 1860, to resume under different conditions the work interrupted at Villafranca. The task was a tortuous and delicate one, and required skilful managing. The possession of Lombardy and the overthrow of Austria were the tangible results of the late campaign. With regard to the rest of Italy, and in the further development of events, four influences had to be considered:—France, which was bound by the treaty of Villafranca to the restoration of the old rulers of Central Italy; Austria, which insisted on the fulfilment of this and other conditions of the treaty; England, where in obedience to public opinion, which now began to understand the real issues at stake in Italy, the Government inclined to let the people have their own way; and the people of Italy itself, decidedly anxious for Italian unity, but in danger of falling into the ruinous excesses of 1848. It was now the business of Cavour so to manage the course of diplomacy, as to prevent a collision with France or Austria, to gain time for the public opinion of Central and Southern Italy to declare itself, and to avoid everything like disunion or uproar in bringing the various provinces under the government of Victor Emmanuel. First, then, in early spring, the population of Tuscany and Emilia all but unanimously declared in favour of annexation, though this result was embittered by the consequent cession of Nice and Savoy to France, which

claimed these districts as compensation and security. Cavour was severely reproached by many, and above all by Garibaldi, for this concession. But there are three considerations, which seem entirely to clear him from any appearance of want of patriotism,—the necessities of his position as regarded France, and the facts that the Savoyards are far more French than Italian, and from a geographical and military point of view belong more naturally to France than to Italy. In the south, where the Pope and the king of Naples still maintained a settled government, the unification of Italy seemed to meet with greater difficulties, when Garibaldi stepped forward to cut the knot. It was certainly not against the will of Cavour that the hero set out on his adventurous enterprise. He could evidently do nothing else than carefully watch the progress of the expedition, ready to own or disown it, according to the event. Accordingly, on Garibaldi's triumphant arrival at Naples, the Piedmontese army occupied the Marches and Umbria, crossed the Apennines, and on the plains of Campania shook hands with the volunteers of Garibaldi. The hero saluted Victor Emmanuel king of Italy. Next spring the first Italian Parliament met at Turin; and Cavour saw the dream of his youth realized. He had seen a new Italy spring from the ashes of the old, an Italy of representative government and of enlightened progress, the mistress of her own destinies, and a worthy member of the commonwealth of nations. Still much remained to be done, the sores caused by centuries of misgovernment required to be healed, the finances arranged, a navy created, the relations with the church regulated, and a thousand other matters attended to, ere the new Italy could answer to the ideal in the mind of Cavour. And now he was to be taken away in the very midst of his task. For many years, and especially during the slippery and delicate events of the last year, and during the harassing debates with the Garibaldian party as to the cession of Savoy and Nice, and the treatment of the volunteers, he had been doing an amount of work which no human strength could bear. There were premonitory symptoms enough; but the keen sense of the responsibilities weighing upon him seemed to increase as his strength declined. Medical men differed as to the precise form his disease took; but that overwork was the cause of it, no one doubted. After some days' illness, during which his feverish talk ran ever on Italy, he died on the 6th of June 1861.

It is needless to describe the sensation caused by his death, and the passionate grief of every Italian patriot. It was felt by every enlightened man that a great and beneficent worker had passed away from the earth. The worthy countryman of Dante and Michelangelo, he had been privileged to achieve a mightier task than they; the one had written a great poem, and the other had executed certain noble works of art; Cavour recalled to life the nation they all loved so well.

Victor Emmanuel and Garibaldi did their part in the consummation of the great work, while without the help of France it clearly would have been impossible; but it must be admitted that Cavour was the indispensable person who brought all the other agencies into wise and effective action. To him it is chiefly due that Italy anticipated Germany in the recovery of her national rights, and led the way in two of the most salutary revolutions that have taken place in the history of the world. He, therefore, deserves to be gratefully remembered not only as a true patriot, but as one of the benefactors of mankind.

Cavour was not eloquent in the ordinary acceptance of the word; but if the force of words is to be measured by their influence on the will of men, he was one of the most powerful speakers that ever lived; for he achieved what he did, not only as the adviser of the king, but as the

leader in the Sardinian Chambers. In private life he was upright, genial, and forgiving. In public life, as we have seen, his one passion was the regeneration of Italy. In fact, few statesmen have left a more stainless name behind them. He was never married, and left his property to the children of his elder brother, who, it may be added, was a staunch adherent of the reactionary party.

See De la Rive, *Le Comte de Cavour : récits et Souvenirs*, 1862 (translated into English, same date); and a memoir by E. Diecy, 1861.

(T. K.)

CAVY, a name common to several species of Rodents belonging to the family *Cavidae*, all of which, at least in the wild state, are confined to the South American continent. They are small creatures, seldom exceeding a foot in length, burrowing in the ground, and feeding entirely on fruits and herbs. There are several species. (1.) The Patagonian Cavy (*Dolichotis patagonica*), larger than a hare, but somewhat resembling that rodent in external appearance, inhabits the dry sterile districts of Patagonia and La Plata, disappearing wherever the country becomes more humid. It is a shy creature, forming burrows in the earth, although in districts where the bizcacha is found, it is said to avail itself of the subterranean works of the latter. It feeds by day, roaming in search of food in small companies, "hopping," says Darwin, "one after the other in a straight line over the gravelly plain." Unlike other cavy, its eyes, like those of the kangaroo, are protected from the glare of the sun by prominent eyelashes. It is covered with a long dense fur of a rusty colour, and has a short tail. It produces two young at a birth. (2.) The Restless Cavy (*Cavia aperea*), found throughout Uruguay and Brazil, is supposed to be the wild form of the Guinea-pig of Europe. It is about 10 inches long, is destitute of a tail, and weighs a little over 1 lb; its fur is long and of a nearly uniform greyish-brown colour. The *aperea* is rarely found in dry sandy localities, preferring marshes covered with aquatic plants, among which it lies concealed, feeding in the early morning and after sunset in the evening, but when the soil is dry it forms burrows like the other cavy. It is said to live in societies of from six to eighteen individuals, to breed but once a year, and to have one or at most only two young at a birth. The Guinea-pig (*Cavia cobaya* of some authors) was, according to the zoologists of the 16th century, unknown in Europe previous to the discovery of America, and there is little doubt that it was introduced from the southern division of that continent, the name of Guinea-pig being probably given by mistake for Guiana-pig. It differs, however, in many important respects from the wild *aperea*. It is somewhat larger, as might be expected in a cultivated form; the colour of its fur is white, variegated with irregular patches of red and black. It perishes on the marshy soil which the other prefers; it produces a numerous progeny three times a year; and what is more important still, the two forms do not couple together, a difference which among wild species is usually held as indicating generic distinctness. It appears, from the drawing of Aldrovandus, that the Guinea-pig had already attained its present variegated colouring fifty years after the discovery of America, a fact which has led to the supposition that it had been previously domesticated by the natives of South America. Mr Waterhouse, however, thinks it more probable "that some pretty variety had attracted the attention of the earliest European settlers in the New World, and given rise to its capture and domestication, more especially as the harmless disposition and pretty colouring of the common Guinea-pig appear to be the only claims of interest which are attached to it" (*Natural History of the Mammalia*, vol. ii.) It is a singularly inoffensive and defenceless creature, of a restless disposition, and greatly wanting in that intelligence which

usually characterizes domestic pets, although it is said to show some discrimination. It is of no particular service to man, neither its flesh nor its fur being put to use, while the statement that its presence is sufficient to drive off rats and mice appears to be without foundation. It is exceedingly prolific, beginning to breed at the age of two months; the number of young varies, according to the age of the parent, from four to twelve. It has been calculated that a single pair of Guinea-pigs may prove the parent stock of a thousand individuals in a single year. (3.) The Bolivian Cavy (*Cavia boliviensis*), found throughout the higher regions of Bolivia, usually at an elevation of 10,000 or 12,000 feet, is exceedingly shy, and lives in burrows, these in some districts being so numerous as to have completely undermined the soil. (4.) The Rock Cavy (*Cavia rupestris*), distinguished by its short, blunt nails, is found in rocky situations throughout Brazil, and is much sought after for its flesh, which is considered a dainty by the Indians. (5.) The Southern Cavy (*Cavia australis*), common along the coast of Patagonia, forms deep burrows, with several outlets, in sandy declivities, and is said to climb trees in search of the fruit on which it feeds.

CAWNPUR [CAWNPORE], a district of British India within the jurisdiction of the Lieutenant-Governor of the North-Western Provinces, lies in 25° and 26° N. lat., and 79° and 80° E. long. It is bounded on the N. by the province of Oudh, the Ganges River forming the boundary line; on the E. by Fatehpur district, on the S. by the Janná, separating it from Hamirpur and Jalaun districts, and on the W. by Etawah and Farrakhabád districts. The district is situated between the Ganges and Janná rivers, and is a portion of the well-watered and fertile tract known as the Duáb. The general inclination of the country is from north to south. Besides the two great rivers, the principal streams are the Arand or Rhind, the Karan or Singar, the Isan, and the Pandu. An extension of the great Ganges Canal also passes through the district. The total area is 2336.53 square miles. The census of 1872 returned the total population of Cawnpur district at 1,156,055, made up as follows:—Hindus, 1,065,786, or 92.20 per cent. of the total population; Muhammadans, 89,215, or 7.72 per cent.; Christians (*i.e.*, Europeans, Eurasians, and native Christians), 1054, or .08 per cent. Total number of villages and townships, 1985; total number of houses, 272,232. Only two towns in the district contain a population of upwards of 5000 souls, namely Cawnpur town and cantonments, population 122,778, and Bilhaur, population 5954. Of the total area of the district, *viz.*, 2336.53 square miles, 1351.42 square miles are cultivated, and 236.15 cultivable, the remainder being uncultivable waste. The staple crop is wheat, but cotton of an excellent quality has of late years been much cultivated. The principal industry is leather work, which is very extensively carried on throughout the district,—Cawnpur saddlery and harness being exported to all parts of India. The trading towns of importance besides Cawnpur are,—Bilhaur, population 5954; Akbarpur, population 4911; and Kashi-pur, population 4663. Most of the towns and large villages have markets once or twice a week for the sale of local produce and cattle. The only regularly-constituted municipality in the district is Cawnpur, but ten small towns have a municipal committee, and carry out conservancy and sanitary arrangements, &c., by means of taxes assessed on the householders. The last settlement of the land revenue of the district expired in 1872, and a new one is in progress.

The district revenue in 1872-73 was £576,587, of which £212,276 was derived from land, £12,163 from opium, and £15,882 from stamps. The district police force in 1873 numbered 555, costing £9165, 8s.; the village watchmen, or rural police (maintained by the villagers), 2985, estimated cost £10,745; municipal police, for

eleven towns, 414 officers and men, costing £3183, 12s. At the charitable dispensaries 2634 patients received treatment during 1873, at a cost of £1131, 5d., of which Government contributed two-thirds. The Government and aided schools in the district in 1873 numbered 391, attended by 10,731 pupils.

CAWNPUR CITY, the administrative headquarters of the district of the same name, and a large military cantonment, situated on the right or south bank of the Ganges, in 26° 29' N. lat. and 80° 23' E. long. The river here is about 500 yards wide in summer, but when swollen by the rains increases to about a mile in breadth, with a strong and rapid current. It is navigable southwards to the sea, a distance of 1000 miles; and upwards as far as Sukertál, 300 miles to the north-west. A bridge of boats crosses the Ganges at Cawnpur, and the *gháts*, or landing-places, on the bank present a busy scene of commerce. The city is built on a sandy plain; and, together with the cantonments, contained in 1872 a total population of 122,710 souls, classified as follows:—Hindus, 90,582; Muhammadans, 31,888; Christians, 300. This classification apparently excludes the European soldiers. The cantonment forms one of the large military stations of Northern India, and has accommodation for 7000 fighting men. Excluding the cantonment, the population within the limits of the Cawnpur municipality amounted to 98,476 in 1872. The municipal income in 1871-72 amounted to £19,323, and the expenditure to £15,639. Cawnpur is a station on the East India Railway, and also a terminus of the Oudh and Rohilkhand Railway. The principal thoroughfare in the native town is the Chandui Chauk, or "street of silver," upwards of 100 feet in width. Cawnpur is noted for the excellence and cheapness of its leather manufactures, such as saddlery, harness, boots and shoes, &c.

History.—The importance of Cawnpur city dates from its selection as a military post, when the Ceded Provinces were acquired by the East India Company in 1801. The one great event in its history is the siege of the British position by the rebel Sepoys during the mutiny of 1857, and the treacherous massacre which followed on the surrender of the garrison. The story of the mutiny and massacre of Cawnpur has been fully chronicled by Sir J. W. Kaye, Colonel Mowbray Thomson, and Mr G. O. Trevelyan. On the deposition of Máharájá Bájí Rao, the last Marhattá Peshwá, or sovereign of Puna, by the East India Company, he received an annuity of £80,000 a year, and had a princely residence assigned to him at Bithur, a short distance from Cawnpur. Here he lived in great state until his death in 1851. His heir was an adopted son, named Sirik Dandhu Panth, more commonly known as the Náná Sáhib, who succeeded to the late Peshwa's estate at Bithur, and to the great accumulations of wealth which he had left behind him. An application of Náná Sáhib for a continuance of the annuity or pension granted to his adoptive father was, however, disallowed by the Indian Government; and on appeal, this decision was upheld by the Board of Control and by the Privy Council in England. For this refusal to grant what he looked upon as his right, Náná Sáhib cherished a bitter grudge against the English, which, however, he carefully concealed until the outbreak of the mutiny afforded him his opportunity for revenge.

In May 1857 the European force in the Cawnpur cantonment consisted of a handful of artillery and infantry, making about 300 fighting men, including the English officers of the Sepoy regiments. The native force comprised the 1st, 53d, and 65th regiments of native infantry, and the 2d regiment of Bengal cavalry, about 3000 men in all. The division was commanded by General Sir Hugh Wheeler. The native troops began to manifest, early in 1857, the same symptoms of disquiet as other native regiments stationed in Bengal and Upper India. When the news of the outbreak at Meerut and Delhi reached Cawnpur, the excitement among the native soldiery, camp followers, and city population increased to such a degree that General Wheeler deemed it expedient to throw

up defensive works, within which the whole Christian population might gather in event of a rising. Unfortunately, the site chosen for the entrenchment proved unsuitable in almost every respect. "The fortifications," writes Sir John W. Kaye, "were so paltry, that an English subaltern could have ridden over them on a cast horse from the company's stud. The earthworks were little more than 4 feet high, and were not even bullet-proof at the crest. The apertures for the artillery exposed both our guns and our gunners, whilst an enemy in adjacent buildings might find cover on all sides." Towards the end of May it became evident that the rising of the Sepoys was only a question of time, and accordingly all women, children, and non-combatants were gathered within the improvised entrenchments. On the night of the 4th June the crisis arrived. The 2d cavalry set the example of open rebellion, and were immediately followed by the 1st regiment of foot. The treasury was robbed, and the magazine, with its enormous supplies of ammunition and artillery, was taken possession of by the mutineers. The following morning the 53d and 56th native regiments joined their comrades.

The Náná's opportunity had now come. He placed himself at the head of the rebels, and was proclaimed Peshwá of the Marhattas, in feudatory allegiance to the Delhi emperor. On the 6th June he sent notice to General Wheeler that he was about to attack the position. Within this slight fortification upwards of a thousand souls had taken refuge, of whom 465 were men of all ages and professions. Every one able to bear arms was told off to the defence. At noon began the siege, "the miseries of which to the besieged," says Sir J. W. Kaye, "have never been exceeded in the history of the world. All the wonted terrors of a multitudinous enemy without, of a feeble garrison and scant shelter within, of the burden of women and children and sick people, with little to appease their wants or to allay their sufferings, were aggravated by the burning heat of the climate. The June sky was little less than a great canopy of fire; the summer breeze was as the blast of a furnace; to touch the barrel of a gun was to recoil as from red-hot iron. It was the season when European strength and energy are ever at their lowest point of depression; when military duty in its mildest form taxes the powers of Englishmen to the utmost, and English women can do little more than sustain life in a state of languid repose, in shaded apartments, with all appliances at command to moderate the temperature and mitigate the suffering. But now, even under the fierce meridian sun, this little band of English fighting men were ever straining to sustain the strenuous activity of constant battle against fearful odds, whilst delicate women and fragile children were suddenly called to endure discomforts and privations which it would have been hard to battle with in strong health under their native skies."

The deficiencies of the position as a place of defence soon became apparent. It was exposed to a continuous cannonade from heavy siege guns, taken from the magazine, and to a ceaseless hail-storm of musketry fire from a range of buildings just outside the entrenchments. All attempts of the mutineers to push forward were fiercely driven back, and a general attack upon the British position was defeated with heavy loss to the assailants. But the contest was too unequal to last long. By the end of the first week our fifty-nine artillerymen were all wounded or killed at their posts. On the eighth day of the siege a great calamity befel the garrison. The building assigned as a shelter for the women and children was burned down, and the sick and wounded had henceforth neither roof over head to shelter them by day, nor any bedding between them and the bare earth at night. The miseries of hunger and thirst and disease were now added to the fire of the enemy and the exposure to the burning sun. During the three weeks which the siege lasted, 250 of the little garrison were interred in the well within the entrenchment.

Fearfully reduced in numbers, with their guns almost unserviceable, their ammunition nearly expended, and starvation staring them in the face, they found it impossible to hold out much longer. When thus almost at the last extremity of despair, a written message came from the Náná, offering to provide a safe passage to Allahábád to all who laid down their arms. The question of capitulation was long and anxiously discussed before the measure was decided on; but the consideration of the women and children, and of the sick and wounded, led to the acceptance of the Náná's terms on the 26th June, and it was arranged to evacuate the entrenchment next morning, the Náná engaging to provide safe conduct for the garrison to the river side, and sufficient boats to convey them to Allahábád.

Accordingly, on the following morning, the remnant of the little garrison left the entrenchment and feebly dragged themselves to the river-stairs appointed as the place of embarkation. Here ensued the act of treachery which was destined for long years to embitter the feelings between the English nation and the Indian races. The boats were in waiting as arranged, and the embarkation was accomplished. No sooner, however, were all on board than on a signal the native boatmen deserted their vessels and clamored to shore. A murderous fire was opened on the boats from both sides of the river, and presently the thatched roofs of the vessels burst into flames, having been ignited by hot cinders. The boats were aground

at the time of their abandonment by their crews. On the opening of the fire every attempt was made to get them afloat in mid-channel, but most of them remained immovable. "The sick and wounded," says Sir J. W. Kaye, "were burnt to death or more mercifully suffocated by the smoke; whilst the stronger women with children in their arms took to the river, to be shot down in the water, to be sabred in the stream by mounted troopers who rode in after them, to be bayoneted on reaching land, or to be made captives and reserved for a later and more cruel immolation." The male prisoners were immediately killed, but of women and children it is computed that 200 were spared for the time by order of the Nānā, and conveyed back to Cawnpur. Of the boats which got afloat only one succeeded in forcing its way through the mass of enemies on both banks of the river, and with it, a few men, two officers and two privates, survived to relate the story of Cawnpur. The rest of the tale is soon told. English troops were being hurried forward by forced marches to the relief of Cawnpur under Major Renauld and General Havelock. On the 12th July they came up with the rebel army at Fathipur, and after a short encounter—it could not be called a fight—utterly routed it. Another engagement with a like result took place at Aoung on the 15th July, 22 miles from Cawnpur. On this day, the 15th, the Nānā heard of the defeat at Fathipur, and learned that Havelock's little army was in full march upon Cawnpur. Furious at the news, he resolved upon a great final act of butchery. Orders went forth for the massacre of the women and children, the survivors of the dreadful day at the river side. Four or five men who were among the prisoners were first shot in the presence of the Nānā, and then the women and children were slashed to death in their prison by Muhammadan butchers from the bazaar, and one or two of the Nānā's followers. Their bodies (some, it is said, with life not quite extinct) were thrown into the well which had served as an improvised cemetery during the siege. After this crowning act of infamy Nānā Sāhib resolved upon making one last stand for Cawnpur, and gave battle to Havelock a few miles south of the city on the 16th July. The fight was more hotly contested than those which had preceded it, but ended in the same result. During the night Nānā Sāhib fled with the remnant of his army, and the next morning Havelock entered Cawnpur, but too late to save the captives whom he had hoped to rescue. A marble shrine with a statue of the Angel of Peace by Morelletti now covers the well, and the sad scene has been surrounded by a lovely garden. The spot is one of the most pathetic in India, and, to quote the words of the legend round the shrine, will for ever be "Sacred to the perpetual memory of a great company of Christian people, chiefly women and children" who lie beneath. A memorial church has also been built in commemoration of the events of the siege. (W. W. H.)

CAXAMARCA, or **CAJAMARCA**, a city of Peru, capital of a province of the same name, in the department of Truxillo, in 7° 7' S. lat. and 78° 31' W. long. It is situated on the east side of the Western Andes, in a fertile valley on the Erizejnas, at an elevation of about 9060 feet above sea-level, 72 miles N.N.E. of Truxillo. The streets are regular and wide; but the houses are mostly built of clay. The principal buildings are the fine parish church, erected at the expense of Charles II. of Spain, the church of San Antonio, the Franciscan monastery, a nunnery, and the remains of the palace of Atahualpa, the last of the Incas of Peru, who was put to death there by the Spaniards in 1533. At a short distance to the east of the town are the deep sulphur springs of Pultamarca, called the Baños del Inca, or Inca's Baths, which have a temperature of 156° Fahr., and are still much frequented. The manufactures of Caxamarca are woollen and linen goods, and steel and silver articles; also biscuits, which are much esteemed. Much trade is carried on with Truxillo; and a railway connects the town with the port of Pacasmayo. Population, about 12,000.

CAXATAMBO, a town of North Peru, 120 miles N.N.E. of Lima, on the western declivity of the Andes, in 9° 53' S. and lat. 76° 57' W. long. The inhabitants, numbering 6000, are occupied in rearing sheep and cattle, in the cultivation of corn and cochineal and the manufacture of woollen yarn, and in working the silver mines near the town.

CAXTON, WILLIAM (1422–c. 1491), the introducer of printing into England, was born, as he tells us himself, in "Kent in the Welde." The date of his birth is uncertain; Oldys places it in 1412, while his most recent

biographer, Mr Blades, shows that it could not have been much later than 1423. The latter, however, fixes upon 1422–3 as the approximate date; and this appears to be as near correctness as we are likely to attain. 1412 seems too early; for, by the records of the Mercers' Company we find that in 1438 William Caxton was apprenticed to Robert Large; and it is far more likely that he was apprenticed at sixteen than at twenty-six. Robert Large was a man of great wealth and of high position; in 1430 he was sheriff, and in 1439 he celebrated his election to the office of Lord Mayor with extraordinary splendour; and the fact that Caxton was apprenticed to a merchant of such distinction makes it nearly certain that he belonged to a family of considerable influence. In 1449 his master died; and it became the duty of his executors to place Caxton where he could fulfil the term of his apprenticeship. They sent him to Bruges; at least, we know that he was there soon after. In this town he entered into business on his own account, and prospered so well that before 1450 he was considered substantial security for £110, which would be equivalent to £1000 at the present time; and eight years later he had become governor of the Company of Merchant Adventurers. Caxton appears to have been a man of considerable polish, and to have had a high reputation for sagacity; for in 1465, the treaty with the duke of Burgundy concerning the wool trade being about to expire, he was appointed by the king, along with Sir Richard Whitehill, to negotiate its renewal; and this attempt having failed, he was again sent on a similar mission three years later by the Mercers' Company, after the marriage of the duke to the sister of King Edward IV. In the next year, which is worthy of note as that in which he commenced his *Recuyell des Histoires de Troie*, he was considered worthy to share in the gift of the "vin d'honneur," which was presented by the authorities of Bruges only to the most important men in the city. In the autumn of 1470 Caxton obtained, and availed himself of, an excellent opportunity for acquiring favour and influence in the English court; for Edward IV. had, with his supporters, been driven into exile, and had taken refuge in Bruges, at the court of his brother-in-law, the duke of Burgundy.

In 1471 Caxton, perhaps because he was beginning to find the duties of the office which he held too severe for his declining strength, or it may be because the interruption in the wool trade to which we have referred had diminished his fortune, entered the service of the duchess of Burgundy, from whom he received a yearly pension. At her command he continued the *Recuyell*, which was finished in September of that year.

About this time Caxton learned the art of printing. Wynkyn de Worde, his disciple, says that he was taught at Cologne by Ulrich Zell; but Worde is often inaccurate, and he seems rather to have had Colard Mansion as his master. That printer was at Bruges; what need then for Caxton to go to Cologne? Besides Caxton's types are more like Mansion's than Zell's; and, indeed, it was long before he adopted the improvements which the latter introduced.

At what date Caxton brought his press to England and set it up at Westminster is quite uncertain. It was probably between 1471 and 1477. 1474 is the date of the *Game and Playe of Chesse*; but the tradition that this work was printed in England may not be correct. He received valuable patronage, being employed by Edward IV., Richard III., and Henry VII., by the duchess of Somerset, the earl of Arundel, Sir John Fastolf, and other nobles; and he appears to have been busy writing and printing up to his death, which occurred about 1492.

Of Caxton's private life and character we know very

little. His temper seems to have been strongly conservative; he delighted in the glories of chivalry, and declared that he would rejoice in a new crusade which should prevent its decay. This disposition was also displayed in his great slowness to adopt reforms in typography. He appears to have been a shrewd and courtly man of business, and a scholar of considerable attainments, for he was acquainted with French, Latin, and Dutch, and was master of an English style which is both pleasant and vigorous.

For an account of his typography, see PRINTING. His life has been written by Oldys in the *Biographia Britannica*, by Lewis (1738), by Charles Knight, and by Mr Blades.

CAYENNE, an island of South America. See GUIANA.

CAYENNE, a seaport town, and the capital of French Guiana, on the north-west extremity of the island of Cayenne, and near the mouth of the river of that name, in 4° 56' 5" N. lat. and 52° 20' W. long. The town forms an almost perfect square, and has clean and well-macadamized streets. The houses, mostly of two stories, are of wood, strengthened on the first and ground floors by brick-work. In the old town, which contains the Government-house and Jesuits' College, the streets are not so regularly and well built as in the new. The Place d'Armes, a fine quadrangular space, lies between them. The streets are lighted with oil lamps, which burn for nearly twelve hours. Cayenne has a parish church, three Roman Catholic chapels, a nunnery, and two schools; also a bank and savings bank under Government supervision, military and civil hospitals, and a hospital for leprosy; but it has no hotel, theatre, club, reading-room, or any place of amusement. To the right of the governor's house is Mount Cépéron, on which stand Fort St Michell, the marine barracks, the signal station, and the light-house. Here, too, are the capacious reservoirs for the water-supply of the town, the source of which is a lake to the south of the island. The harbour is shallow at its entrance, but sufficiently deep within to float vessels of 800 tons' burthen; craft drawing much water are obliged to load and unload at a distance of seven or eight miles from the town. There is no dock for the repair of vessels; and the quay is small, though of sufficient size to meet requirements. The principal exports of Cayenne are native gold, raw sugar, annatto, cocoa, coffee, limes (in brine), rum, molasses, isinglass, cotton, hides, woods, and spices. In 1873 the gold which paid export duty weighed 2206 lb troy. The imports are French wines, spirits, and liqueurs; vinegar, silk and cotton stuffs, tobacco, hardware, glass, earthenware, clothing, preserved meat, fish, and vegetables, maize, flour, hay, bran, oils, and cattle. The value of the total exports in 1873 was £120,014, of the imports £282,808,—the import trade having increased and the export trade sensibly diminished during the preceding thirty-five years. In 1872 the vessels cleared were 90, tonnage 19,688; the vessels entered, 87, tonnage 18,530. There is a regular mail service between Cayenne, the West Indies, and Europe, once a month. The ports trading with Cayenne are Martinique, Nantes, Bordeaux, and Marseilles, and Salem in the United States. Cayenne is the seat of the Government of French Guiana, and a penal settlement for political offenders. It is provided with an efficient police force, and is well governed. Food as well as clothing is exorbitantly dear, the only cheap articles of consumption being bread and French wines. The temperature of Cayenne is between 76° and 88° Fahr. throughout the year; but the heat is tempered by easterly winds. Between December and March a north wind blows, unfavourable to weak constitutions. Yellow and other fevers often attack the inhabitants of the town, which, owing apparently to the vast swamp that flanks one side of it is far from healthy. The death-rate

amongst the coolies is especially high. Population, about 7000.

CAYENNE PEPPER, GUINEA PEPPER, SPANISH PEPPER, CHILLY, a preparation from the dried fruit of various species of *Capsicum*, a genus of the Natural Order *Solanaceae*, to which belong also the potato, tomato, and bittersweet. The true peppers are members of a totally distinct order, the *Piperaceae*. The fruits of plants of the genus *Capsicum* have all a strong pungent flavour. The capsicums bear a greenish-white or violaceous flower, with a wheel-shaped corolla, five anthers (connivent and dehiscing lengthwise), and an obtuse stigma. The ovary becomes a pod, consisting of an envelope at first fleshy and afterwards leathery, within which are the spongy pulp and several seeds. The leaves are entire, and alternate, or in pairs near one another; the peduncles are extra-axillary. There are many kinds of capsicums, ranked by botanists either as distinct species or as varieties. Don, in his *General System of Gardening and Botany*, gives a list of thirty-three species. They are chiefly natives of Brazil, the West and East Indies, and China. They are now grown in various parts of the world, both for the sake of the fruit and for ornament. In England the annual sorts are sown from March to the middle of April, under a frame. They can be planted out when 2 or 3 inches high, and in June may be transferred to a light rich soil in the open garden. They flower in July or August, and produce pods from August till the end of September. The perennial and shrubby kinds may be wintered in a conservatory. Several species or varieties are used to make Cayenne pepper. The annual or common capsicum (*C. annuum*), the Guinea Pepper plant, was brought to Europe by the Spaniards, and was grown in England in 1548. It is indigenous to South America, but is now cultivated in India, Hungary, Italy, Spain, and Turkey, with the other species of capsicum. It is a hardy herbaceous plant, which attains a height of 2 or 3 feet, and bears a pod usually of an ovate shape, and yellow, red, or black in colour. The Spur or Goat Pepper (*C. frutescens*) has been an inmate of English gardens since 1656. It is a dwarf shrub, a native of the East Indies, which produces a small pod, having very pungent properties. *C. tetragonum*, or Bonnet Pepper, is a species much esteemed in Jamaica; it bears very fleshy fruits. Other well-known kinds of capsicum are the Cherry Pepper (*C. cerasiforme*); Bell Pepper (*C. grossum*), which has thick and pulpy fruit, well adapted for pickling; and Berry or Bird Pepper (*C. baccatum*). The last mentioned has been grown in England since 1731; its fruit is globular, and about the size of a cherry. The West Indian stomachic *Man-dram* is prepared by mashing a few pods of bird pepper and mixing them with sliced cucumber and shallots, to which have been added a little lime-juice and Madeira wine. Chillies, the dried ripe or unripe fruit of capsicums, are used to make chilly-vinegar, as well as for pickles. Cayenne pepper is manufactured from the ripe fruits, which are dried, ground, mixed with wheat flour, and made into cakes with yeast; the cakes are baked till hard like biscuit, and then ground and sifted. The pepper is sometimes prepared by simply drying the pods and pounding them fine in a mortar. Cayenne pepper is occasionally adulterated with red lead, vermilion, ochre, salt, ground-rice, and turmeric. The taste of the pepper is impaired by exposure to damp and the heat of the sun. Chillies have been in use from time immemorial; they are eaten in great quantity by the people of Guiana and other warm countries, and in Europe are largely consumed both as a spice and as medicine. Their hot and biting taste is due to the presence of the alkaloid *Capsicine*, a reddish body, having a balsamic and extremely acrid and irritating odour. The Cayenne pepper plants, with the rest of the

Solanaceæ, have not the narcotic properties of the genera of the most nearly allied order Atropaceæ, unless, as has been affirmed, these are resident in the pulp of certain species of capsiums. Medicinally, Cayenne pepper is used with cinchona in lethargic affections, also in atonic gout accompanied by flatulence, and in tympanites and paralysis. It is employed as a stimulant in those forms of dyspepsia which are due to faulty chymification and defective secretion of gastric juice. In malignant scarlatina it is used either in the form of a tincture or as a gargle. To make the tincture, a pint of vinegar is boiled with two tablespoonfuls of powdered chillies and a teaspoonful of salt, and then strained. Cayenne pepper taken in large quantities acts as an irritant poison. A dose of powdered capsium is from 1 to 5 grs., and of the tincture from 5 to 15 drops.

CAYLUS, ANNE CLAUDE PHILIPPE DE TUBIÈRES, COMTE DE, Marquis d'Esternay, Baron de Bransac (1692-1765), was born at Paris in October 1692. He was the eldest son of Lieutenant-General Count de Caylus, and while a young man he distinguished himself in the campaigns of the French army, from 1709 to 1714. After the peace of Rastadt, he spent some time in travelling in Italy, Greece, the East, England, and Germany, and devoted much attention to the study and collection of antiquities, publishing several works on the subject, among which are the *Recueil des Antiquités égyptiennes, étrusques, grecques, romaines, et gauloises* (Paris, 1752-5), *Numismata Aurea Imperatorum Romanorum*, and a description of the method of encaustic painting with wax mentioned by Pliny, which he had rediscovered. He was also an admirable engraver, and he copied many of the paintings of the great masters. He did his best to assist the cause of art, by writing the lives of the most celebrated painters, by causing engravings to be made, at his own expense, of Bartoli's copies from ancient pictures, and by publishing his *Nouveaux sujets de peinture et de sculpture* (1755) and *Tableaux tirés de l'Iliade, de l'Odyssée, et de l'Enéide* (1757). Caylus is besides known as the author of a number of romances, humorous pieces, and fairy tales. He was a man of singular simplicity, generosity, and kindness.

CAZALLA DE LA SIERRA, a town of Spain, in the province of Seville, 36 miles north of the city of that name, on the Sierra Morena. The town is well laid out, and contains numerous churches, and there are Roman and Moorish antiquities in its suburbs. The neighbouring mountains are well wooded, and yield ores of iron, copper, silver, and antimony, pyrites, and variegated marble. Tanning, weaving, the making of oil, brandy, and wine, and the smelting and working of metals, are the chief employments of the inhabitants. Population, 6850.

CAZEMBE is properly the hereditary name of an African chief, whose territory is situated to the south of Lake Moero and the north of Bangweolo, between 11° and 9° S. lat. In the end of the last century the authority of the Cazembe was recognized over a very extensive district, but the prestige of the dynasty has greatly diminished, and the present representative does not even rank first among the tributaries of the Muatinyanvo of the Rua or Moluwa kingdom. The country, which has no more distinctive title than the land of the Cazembe, is estimated to have an area of 120,000 square miles and a population of 500,000. It forms a kind of hollow plain, and is richly watered by numerous rivers. Of these the most important is the Luapula, which flows from Bangweolo to Moero, and forms, according to the conjecture of Cameron, one of the head waters of the Congo. The population consists mainly of two races, the Messiras and the Campololas,—of whom the former are native and subjugated, and the latter intrusive and dominant. The Campololas alone are

eligible to public offices, and their language is that spoken at court. Considerable attention is paid throughout the country to agriculture; and millet, maize, manioc, sugarcane, yams, gourds, and bananas are grown. The ass and horse are both totally unknown; sheep are very scarce, but cattle are fairly abundant. Salt is obtained in various places, and forms an important source of wealth. Coarse cotton cloth, earthenware, and iron goods are the chief manufactures; and slaves, ivory, and copper-ore are almost the only exports. The Cazembe has despotic power, and uses it in a most barbarous fashion. He has 600 wives, and his nobles imitate his example according to their means. On his accession every new Cazembe chooses a new site for his residence, and thus the country cannot be said to have a permanent capital. The residence at the time of Dr Livingstone's journey in 1868 was situated about a mile to the north of the small lake of Mofwe; and the town occupied, with its cassava grounds and cotton fields, about an English square mile, and had a population of about 1000. It is sometimes called Usemba or Lunda, and Magyar heard it mentioned as Tambalameba; but none of these seems to be its native name. In 1796 the Cazembe was visited by Manoel Caetano Pereira, a Portuguese merchant; and in 1798 a more important journey was undertaken by Dr Francesco Jose Maria de Lacerda, a native of São Paulo in Brazil. He died at Tselungu on the 18th of October, but left behind him a valuable journal. In 1802 Honorato da Costa, superintendent of the Cassange factory, sent two native traders or *pombeiros*, Pedro João Baptista and Anastacio José, on a visit to the Cazembe; and in 1831 a more extensive mission was despatched by the Portuguese governor of Illes de Sena. It consisted of Major José Monteiro and Antonio Gamitto, with an escort of 20 soldiers and 120 negro slaves as porters; but its reception by the Cazembe was not altogether satisfactory. Another expedition is said to have been undertaken in 1853 by a Mr Freitas; and a few notes of a Moorish traveller are given in the *Geographical Journal* for 1854. Livingstone's visit in 1868 has already been mentioned.

See the account of Pereira's journey in *Annuaire Maritimes e Coloniaes*, 1844, and the *Considerações politicas sobre os descobrimentos dos Portuguezes na Africa*, by José Accursio das Neves, 1830; of Lacerda's in *Annuaire* for 1844, 1845, and 1846; of Baptista's in 1843; Monteiro and Gamitto, *O Muata Cazembe*, Lisbon, 1854; *The Lands of the Cazembe*, published by the Royal Geographical Society in 1873, containing Lacerda and Baptista's Journals, and a résumé of Monteiro and Gamitto; "Livingstone's Reisen in Inner Afrika," 1866-1873, in Petermann's *Mittheilungen*, 1875; and Livingstone's *Last Journals*, 1874.

CAZORLA, a town of Spain, in the province of Jaen, on the Vega. It is generally well built, and contains two ancient castles (one of them Arabic), several hospitals, a spacious theatre, a very ancient church, and several convents. It was an important military station under the Moors, and has suffered frequently during the civil wars in Spain. In 1811 it was captured and partly burned by the French, and in 1837 it was distinguished in the Carlist contest. Population, 4980.

CAZOTTE, JACQUES (1720-1792), a French author, was born at Dijon in 1720. He was educated by the Jesuits, and at twenty-seven he obtained a public office at Martinique, but it was not till some years after, on his return to Paris, that he appeared as an author. His first attempts, a mock romance and a coarse song, gained so much popularity, both in the court and among the people, that he was encouraged to essay something more ambitious. He accordingly produced his *Roman d'Olivier*. He also wrote a number of sportive effusions, such as *Diable Amoureux*, among which was a continuation of Voltaire's *Guerre Civile de Genève*, the verisimilitude of which was

such that no one had the least suspicion of the deception. From all this gaiety and licence Cazotte rushed into the opposite extreme, embracing the views of the Illuminati, and declaring himself possessed of the power of prophecy. It was upon this fact that La Harpe based his famous *jeu d'esprit*, in which he represents Cazotte prophesying the most minute events of the revolution. Cazotte was attached to the royal cause, and, on the discovery of some of his letters in August 1792, was arrested; and, though he escaped for a time, through the love and courage of his daughter, he was executed on the 25th of the following month. A complete edition of his works was published in 1817.

CEARÁ, or FORTALEZA, or VILLA DO FORTE, a town of Brazil, in a province of the same name, situated at the mouth of the River Ceará, on an open bay between the promontory of Mararanguape and Cape Mocaripe, in $3^{\circ} 42'$ S. lat. and $38^{\circ} 30'$ W. long. It consists of a new and old town, and has regular and well-paved streets. Opened to general trade in the present century, it exports a considerable quantity of coffee, cotton, and sugar; but it has recently suffered somewhat by the formation of the new port of Aracaty, about ninety miles distant. In 1871 the number of British vessels engaged in the trade was 45, with a tonnage of 28,784. Population about 20,000.

CEBES of Thebes, a disciple of Socrates, mentioned by Plato in the *Phædo*, and by Xenophon as distinguished both for his virtue and for his love of truth, was the author of a once popular didactic dialogue, the *Πάσις* or *Tabula Cebetis*. This work, which professes to be an explanation of an allegorical picture, commences with the Platonic doctrine that men enter the earth from a pre-existent state. There they have been taught how to guide their course in this world; but the draught of oblivion of which all must drink—though not all in equal degree—causes them to forget the instruction. Many allurements entice them to vice, but by patience and endurance they may attain virtue and happiness. The sciences—grammar, geography, arithmetic, geometry, and music—are declared not to be the true discipline, but yet to be useful, especially as a kind of restraining bridle for the young. From certain passages, which are probably interpolations, some have supposed the work to be the production of a Stoic of the same name, who lived under M. Aurelius. The *Tabula Cebetis* has been translated into all the European languages. An Arabic version, with the Greek text, and a Latin translation, was published by Salmasius in 1640. It is usually printed together with Epictetus, as at Strasburg, 1806, and Paris, 1826. Cebes was also, according to Suidas and Laertius, the author of the *Ἐβδόμη* and the *Φρύνικος*, which have been entirely lost.

CEBU, a city of the Philippine Islands, on the eastern side of an island of the same name, about 400 miles S.E. of Manila. It is the oldest provincial town in the archipelago, and still ranks as one of the best built; while its position renders it the chief commercial centre for the Southern Philippines. It is the residence of a military governor and an alcalde, as well as of the governor-general of the Vissagas; and its public buildings comprise a cathedral, an episcopal palace, and a lazaretto. It exports sugar, hemp, tobacco, and sapan-wood, the quantity of the first two in 1870 being 114,806 and 40,756 piculs respectively. Its foreign goods are obtained *via* Manila. There is an old fort built of coral, and in the island of Matan opposite the town is situated the grave of Magellan. The population, inclusive of the suburb of St Nicholas, is reckoned at 34,000.

CECCO D'ASCOLI (1257–1327) is the popular name of FRANCESCO DEGLI STABILI, a famous mediæval encyclopædist and poet,—Cecco being the diminutive of Francesco, and Ascoli, in the marshes of Ancona, the place

of the philosopher's birth. He devoted himself to the study of mathematics and astrology, and in 1322 was made professor of the latter science at the university of Bologna. It is alleged that he entered the service of Pope John XXII. at Avignon, and that he cultivated the acquaintance of Dante Alighieri, only to quarrel with the great poet afterwards; but of this there is no evidence. It is certain, however, that, having published a commentary on the sphere of John de Sacrobosco, in which he propounded audacious theories concerning the employment and agency of demons, he got into difficulties with the clerical party, and was condemned in 1324 to certain fasts and prayers, and to the payment of a fine of seventy crowns. To elude this sentence he betook himself to Florence, where he was attached to the household of Carlo di Calabria. But his freethinking and plain-speaking had got him many enemies; he had attacked the *Commedia* of Dante, and the *Canzone d'Amore* of Guido Cavalcanti; and his fate was sealed. Dino di Garbo, the physician, was indefatigable in pursuit of him; and the old accusation of impiety being renewed, Cecco was again tried and sentenced, this time to the stake. He was burned at Florence the day after sentence, in the seventieth year of his age.

Cecco d'Ascoli left many works in manuscript, most of which have never been given to the world. The book by which he achieved his renown and which led to his death was the *Acerba* (from *acervus*), an encyclopædic poem, of which in 1546, the date of the last reprint, more than twenty editions had been issued. It is unfinished, and consists of four books in *sesta rima*. The first book treats of astronomy and meteorology; the second of stellar influences, of physiognomy, and of the vices and virtues; the third of minerals and of the love of animals; while the fourth propounds and solves a number of moral and physical problems. Of a fifth book, on theology, the initial chapter alone was completed. A man of immense erudition and of great and varied abilities, Cecco, whose knowledge was based on experiment and observation (a fact that of itself is enough to distinguish him from the crowd of savants of that age), had outstripped his contemporaries in many things. He knew of metallic aerolites and shooting-stars; the mystery of the dew was plain to him; fossil plants were accounted for by him through terrene revolutions which had resulted in the formation of mountains; he is even said to have divined the circulation of the blood. Altogether a remarkable man, he may be described as one of the many Cassandras of the Middle Ages—one of the many prophets who spoke of coming light, and were listened to but to have their words cast back at them in accusations of impiety and sentences of death.

The least faulty of the many editions of the *Acerba* is that of Venice, dated 1510. The earliest known, which has become excessively rare, is that of Breseia, which has no date, but is ascribed to 1473 or thereabouts.

CECIL, ROBERT, EARL OF SALISBURY (1550–1612), was the son of Lord Burghley, whose character and ability he inherited, and by whom he was carefully educated for political life. After residing at Cambridge and representing Westminster in parliament, he received a post in the French embassy, and was next made Secretary of State under Walsingham. He was also appointed Chancellor of the Duchy of Lancaster, and Lord Privy Seal, and he succeeded his father as Master of the Court of Wards and Walsingham as chief Secretary of State. It is noteworthy that, though his health was delicate and his person deformed, he served as a volunteer against the Armada. His career was simply a continuation of his father's. He toiled as laboriously and as carefully, and carried out the same system of espionage with equal success. The interest which he took in the domestic affairs of the country and in the state of

Ireland was as great; and the object of his foreign diplomacy was the same,—to prevent Spain from gaining a mastery which would be fatal to England. But he followed the wisdom of his father too well; his policy was wanting in originality and depth of insight; and he has left no mark upon history.

During the reign of the queen he had entered into correspondence with James, upon whose accession he was reappointed to the post of Secretary of State and was raised, in successive years, to the dignities of baron of Essenden, Viscount Cranborne, and earl of Salisbury. In 1608, on the death of the earl of Dorset, he added the office of Lord High Treasurer to that of Secretary. Thus he was now at once chief adviser of the king as to home and foreign affairs, mediator between him and the parliament, and also the responsible manager of the finances of the kingdom. In the last capacity his work was by no means easy. It was vain to hope to moderate the royal extravagance; his attempt to obtain from the Commons an increase of £200,000 to the royal income was unsuccessful; and the chief financial measure which he carried out was an addition to the duties on imports. As Secretary, Cecil followed his father's example with regard to the Catholics, and wrote a *Treatise against the Papists*. His opposition to the growth of Spanish power was consistent, though he accepted a pension from the Spanish king, and refused to unite with France and the United Provinces to effect its utter overthrow.

Cecil has been much blamed for his conduct towards three of the greatest of his contemporaries. Of his cousin, Francis Bacon, he appears to have been jealous; in the noble qualities of the earl of Essex he saw nothing but a dangerous hottheadness; and probably his opinion was similar about Raleigh, who, though more of a politician, was usually as little inclined to be cautious or conciliatory. But all this argues no extraordinary baseness; he was merely wanting, by nature and through education, in breadth of sympathy. The assertion that he was the sole cause of all Raleigh's troubles is unfounded, and is, indeed, contradicted by two facts:—first, that on his trial Cecil more than once insisted that he should meet with all consideration, and should be allowed to urge all he could in his own defence; and, secondly, that it was after Cecil's death that the bitterest feeling against him was displayed, and that he was offered as a sacrifice to Spain. Besides his *Treatise against the Papists*, Cecil published an interesting work on *The State and Dignity of a Secretary of State*. His correspondence with James I. was published by Lord Hailes in 1766.

CECIL, WILLIAM, LORD BURGHLEY or BURLEIGH (1520–1598), an English statesman, born in 1520, was the son of Richard Cecil, Master of the Robes to Henry VIII. After distinguishing himself at Cambridge, he entered Gray's Inn at twenty-one, and soon after obtained the reversion of the office of *custos brevium* at the Court of Common Pleas. He increased his political influence by marriage, first with the sister of Sir John Cheke, and then with the daughter of Sir Anthony Cook; and, at length, through friendship with the protector, Somerset, he became Secretary of State in 1548. After sharing the imprisonment of Somerset, his prudence and sagacity enabled him to regain his office under Northumberland. Yet, when Edward died, he contrived to escape the danger which threatened him on every side. He signed the instrument making over the crown to Lady Jane Grey, but only as a witness; and he kept clear of religious difficulties by displaying no dislike to Catholicism. Indeed it is probable that he really felt little or none. He confessed, attended mass, took a priest into his house; he escorted Cardinal Pole from Brussels, and cultivated his friendship. And, though he opposed

the court party in parliament, and thus kept up his connection with his old friends, his opposition was so moderate as to be perfectly safe. He maintained a constant correspondence with the Princess Elizabeth, and on the death of her sister at once prepared a proclamation declaring her queen. He was immediately appointed Secretary of State, and member of the Privy Council; and from this time he was the foremost minister of the Crown. Foreign ambassadors often regarded him as the possessor of unbounded power, and as practically head of the Government and ruler of the queen, but, in fact, his influence was not so supreme, nor his favour with Elizabeth so uniform. No man, indeed, could always guide that strong-willed monarch; and Cecil had no ambition to be a mere favourite and tool. Though not an enthusiast, and though he never fought for a hopeless cause, he had far nobler aims than personal advancement. Though his statesmanship lay not so much in a power of deep and rapid insight as in the possession of a mind patient to take account of the minutest points, and able to weigh all considerations impartially, he was capable of independent thought and firm decision, and his plans often conflicted with the inconstant intrigues of the queen. On such occasions he did not shrink from telling her that she was wrong; he rebuked her stinginess and treachery, and he several times braved her passionate resentment. From her accession he was Secretary of State, and from 1572 he was Lord High Treasurer; but his services brought him pecuniary loss, and he received no honours but the Mastership of the Court of Wards, the order of the Garter, and the barony conferred upon him in 1571, after thirteen years of service. He was absolutely incorruptible. He refused to use or to sell the office of Royal Exchanger, though it would have brought him several hundred thousand pounds. Mendoza in vain tried to bribe him; to Catherine of Medici's splendid offers he replied that he served none but his God, his mistress, and his country; and he refused to share in the gold of which Drake had robbed the Spaniards. Into the deeper passions of his time he did not enter. It is true that as his life advanced he grew more and more attached to the Protestant cause. He saw that his country had identified herself with that cause, and he was, besides, firmly opposed on political grounds to the pretensions of the Papacy. He appears, however, to have had no special devotion to any form of doctrine; and he opposed the persecution of loyal Puritans and of loyal Catholics. When, indeed, either Catholic or Puritan became disloyal or otherwise dangerous he lost all compunction. He hated and persecuted the Jesuits because they placed the Pope above the laws, but he twice took the trouble to explain to the world that this was the sole reason. He was affected with no inconvenient weakness of sympathy; he could ruthlessly crush any one who seemed dangerous to the state. Essentially honest as he was, he scrupled at no espionage or treachery to gain the secrets of his enemies. His emissaries were everywhere. He kept Herle in the Marshalsea, examined him before the council, and threatened him with torture that the Catholic prisoners might believe him to be a martyr to their cause, and might intrust him with their plans; and he made Bishop Parker appear in the guise of the Catholic Dr Story to take the confessions of a prisoner whom torture could not move. When his policy was opposed to Spain he did not scruple to get up demonstrations against the Spanish ambassador, and to cast into prison all the Spanish merchants in London. Plots against his own life never deprived him of his calmness; he watched De Quadra's conspirators quietly, day after day, though every day he knew they might attempt to murder him, and let them alone till he had gained all the information to be got. Day after day Norfolk and

Arundel came to the council intending to arrest him; and day after day his cool sagacity defeated them. Yet when occasion required he knew how to act with prompt and vigorous decision. He was always struggling against the queen's variability. Being eager that she should marry, he urged her again and again to decide at once; and a paper is extant which he presented to the queen when the last marriage proposal was finally cast aside. In it he sketches a great and able policy. Preparations were to be made for war by land and sea; honours and wealth were to be applied to attract the hearts of the foremost men of the nation, and no longer wasted on useless favourites; Ireland was to be ruled with attentive care and in a conciliatory spirit; and, lastly, there was to be a grand alliance of all Protestants—of England, Sweden, Denmark, Scotland, and the Protestants in Germany, France, and Flanders. With regard to the Queen of Scots he pressed for the most vigorous action. Undeterred by the anger which Elizabeth showed in striking his name from the list of lords-lieutenant, he appeared at Mary's trial to meet her denial of the charges made against her with a stern contradiction. When, at last, Elizabeth signed the warrant, he ventured to oppose her express wish by calling the council to his own house to discuss the matter; and he dared to intercede for Davison when, in a torrent of passion, she sent him to the Tower. The result was that he was fiercely ordered out of her presence, and for two months the queen refused to see him.

In the industry of the country Cecil took the greatest interest. He entertained the serious apprehensions which were commonly felt on account of the increase of importation, the exportation of gold, and the falling off of agriculture; and he protested against the growing use of wine, silk, and other foreign commodities. To make up for the loss to the shipping which the downfall of Catholicism had caused by diminishing the demand for fish, he obtained the passing of a curious law which made the eating of flesh on Friday and Saturday, and on Wednesday unless fish dishes were also placed on the table, a misdemeanour. In short, Cecil devoted himself to the service of his country with the most painstaking and disinterested laboriousness. From the peculiarity of his method of working we have more complete information concerning the details of his career than is usually the case with statesmen; for it was his practice not only to draw up papers of advice to the queen, but also before deciding on any question to set out on paper all the considerations on both sides; and many of these documents, together with many of the letters which he either received or wrote, can still be consulted (see *Scrinia Ceciliana*, 1663, the state papers published in 1740 and 1759, and Tytler's *Ancient Letters*, 1839). Cecil died in office in August 1598.

Among his writings are characteristic *Precepts for the well-ordering of a man's life* (1637), and *The Execution of Justice in England for the Maintenance of Public and Christian Peace* (1581 and 1583; Latin version, 1584). The latter is a defence of the queen's commissioners appointed to examine Papists, with special reference to the use of torture, and a declaration that purely religious belief was never the cause of punishment. An interesting paper of advice to the Queen (1583) is to be found in the *Somers Tracts*. A voluminous life by Nares appeared in 1829-31. See Froude's *History*.

CECILIA, SAINT. A passing word in the very apocryphal legend of this saint has caused her name to be one of the best known in the calendar, and oftenest in the mouths of men. It is related, among other circumstances purely legendary, that Cecilia often united instrumental music to that of her voice in singing the praises of the Lord. On this all her fame has been founded, and she has become the special patroness of music and musicians all the world over. Half the musical societies in Europe are named after her, and her supposed musical acquire-

ments have led the votaries of a sister art to find subjects for their works in episodes of her life. The grand painting by Raphael, at Bologna, in which the saint is represented wrapped in an ecstasy of devotion, with a small "organ," as it was called,—an instrument resembling a large kind of Pandean pipes,—in her hand, is well known, as is also Dryden's beautiful ode.

Her legend relates that, about the year 230, which would be in the time of the Emperor Alexander Severus, Cecilia, a Roman lady, born of a noble and rich family, who in her early youth had been converted to Christianity, and had made a vow of perpetual virginity, was constrained by her parents to marry a certain Valerian, a pagan, whom she succeeded in converting to Christianity without infringing the vow she had made. She also converted her brother-in-law Tiburtius, and a friend called Maximus, all of whom were martyred in consequence of their faith. This is stated to have happened at Rome when one Almacus was prefect; but no such name is known to history. It is unfortunate also for Cecilia's claim to a footing on the solid soil of history, that the earliest writer who makes mention of her, Fortunatus, bishop of Poitiers, represents her to have died in Sicily between the years 176 and 180. It is absurdly stated in the *Biographie Universelle* that Cecilia's name is found in the most ancient martyrologies; whereas, as may be seen from Baronius, the earliest of these documents was compiled by Pope Clement I. who died in the year 100. The French writer maintains that her body must have been transported from Sicily to Rome subsequently to the 4th century, because the saint's name is not found in the Roman calendar compiled in the time of Pope Liberius (ob. 363), from which fact no such conclusion can be drawn. The Roman tradition is that the church dedicated to St Cecilia was built on the site of the house inhabited by her, at her request, by Urban I. about the year 230. We do not reach any ground of certainty, till we come to the councils celebrated by Pope Symmachus in the year 499 (of which, however, some doubt the authenticity), in whose records this church is mentioned, two priests qualifying themselves in their subscription as priests of the church of St Cecilia.

This church was in a ruinous condition in the 9th century; and Pope Paschal I. (ob. 824) built it anew with much splendour. In the course of the work he was, we are told, visited by the saint in a vision, who informed him where her body was to be found in the cemetery of Callistus. Following her indications he found not only her body but those of her husband Valerian, her brother-in-law Tiburtius, their friend Maximus, the Popes Urban I. and Lucius I., and 900 other martyrs! All these Paschal transported with much solemnity and ceremonial to the new church of St Cecilia, which he dedicated to God, to the Virgin, to Saints Peter and Paul, and to Saints Cecilia and Agatha. Cardinal Sfondrati, nephew of Gregory XIV. (ob. 1591), who had his title as cardinal from this church, almost entirely rebuilt it; in the course of which operation the bodies of the saints were found, and were on the 22d of November, the day dedicated to St Cecilia, in the year 1599, deposited in a silver reliquary, and placed by Clement VIII., assisted by twenty-two cardinals, in a small crypt under the high altar. The silver urn was stolen by the French, as their custom was, at the period of their first occupation. One of the best known and most admired modern statues in Rome is that executed by Stefano Maderne in the 17th century, which represents the saint recumbent in her grave-clothes, and in the attitude in which she is described to have been found when her tomb was opened. The church was subsequently "redecorated,"—that is to say destroyed as regards architectural beauty,—in 1725 by Cardinal Doria, who built heavy piers around the columns

of the nave, and enclosed with gratings an upper gallery, which must have been beautiful, in order to make accommodation for the nuns of the adjoining Benedictine monastery to hear, unseen, the services. Still, especially in the tribune at the east end of the church, some interesting relics of the old 9th century church may yet be seen there. The curious mosaics representing St Cecilia, and the other saints to whom Pope Paschal dedicated the church, belong to that period.

The church of St Cecilia is situated at the further end of that part of the city called Trastevere, near the quay of the Ripa Grande, a region which tradition declares to have been the earlier "Foro degli Ebrei," or quarters assigned to the Jews,—a "ghetto," as the part of the city so destined was subsequently called. Here it is said that St Peter, as a Hebrew, was lodged on his first arrival in Rome, and hence began to preach the gospel.

This church has from its first foundation given his "title" to a cardinal priest. For many generations it was the custom for the popes, accompanied by all their cardinals, to celebrate a "Capella papale" here on certain days in the year. And down to the present time, on the 22d of November in each year, the best church music still to be met with in Rome (which is not, however, saying much) may be heard in the church of St Cecilia.

CECROPS, probably a Pelasgian hero, was, according to Athonian tradition, the first king of Attica, and the founder of its political life. He was said to have divided Attica into twelve parts, to have instituted marriage, and introduced a new form of worship. Some late Greek writers held that he came from Egypt. He is represented as human as regards the upper part of his body, while the lower is shaped like a dragon.

CEDAR, a name applied to several members of the Natural Order *Coniferae*. The word *Cedar* (the Greek *κέδρος*) is probably derived from the Arabic *Kedr*, worth or value, or from *Kedrat*, strong. The name has been supposed by some to have taken its origin from the brook Cedron, in Judaea.

The *Abies Cedrus* or *Cedrus Libani*, the far-famed Cedar of Lebanon, is a tree which, on account of its beauty, stateliness, and strength, has always been a favourite with poets and painters; and which, in the figurative language of prophecy, is frequently employed in the Scriptures as a symbol of power, prosperity, and longevity. It grows to a vertical height of from 50 to 80 feet—"exalted above all trees of the field," and at an elevation of about 6000 feet above sea-level. In the young tree, the bole is straight and upright, and one or two leading branches rise above the rest. As the tree increases in size, however, the upper branches become mingled together, and the tree is then clump-headed. Numerous lateral ramifying branches spread out from the main trunk in a horizontal direction, tier upon tier, covering a compass of ground the diameter of which is often greater than the height of the tree. Gilpin, in his *Forest Scenery*, describes a cedar which, at an age of about 118 years, had attained to a height of 53 feet, and had a horizontal expanse of 96 feet. The branchlets of the cedar take the same direction as the branches, and the foliage is very dense and close-woven. The tree, as with the rest of the fir-tribe, except the larch, is evergreen; the leaves are renewed every spring, but their fall is gradual. In shape the leaves are straight, tapering, cylindrical, and pointed; they are about an inch long, and of a dark green colour, and grow in alternate tufts of about thirty in number. The male and female flowers grow on the same tree, but are separate. The cones, which are on the upper side of the branches, are flattened at the ends, and are 4 or 5 inches in length, and 2 inches wide; they take two years to come to perfection, and while growing exude

much resin. The scales are close pressed to one another, and are reddish in colour. The seeds are provided with a long membranous wing. The root of the tree is very strong, and ramifying. The cedar flourishes best on sandy loamy soils. It still grows on Lebanon, eleven groves having been described by the American missionary Jessup; and probably is to be found over the whole group of mountains lying between Damascus and Tripoli in Syria, which comprehends, besides Lebanon, the Mounts Taurus and Armanus of the ancients. Lamartine tells us that the Arabs regard the trees as endowed with the principles of continual existence, and with reasoning and prescient powers, which enable them to prepare for the changes of the seasons. The best known group in the Lebanon range consists of twelve very ancient trees amidst a grove of about 400 younger ones—apparently the yellow cedars spoken of by Lamartine. They occupy little knolls in the Jebel-el Arz, a recess or hollow near the highest point of the mountains, about 15 miles from the sea. One tree on the southern side has a circumference of 42 feet at its base. Lord Lindsay mentions two other cedars on the northern edge of the grove, one 63, and another 49 feet in girth. The number of the trees has been slowly decreasing since 1550, when Belon counted twenty-eight of them; nearly 200 years later, when Dr Pococko visited Syria, only 15 were to be seen. The wood of the cedar of Lebanon is fragrant, though not so strongly scented as that of the juniper or red-cedar of America. It appears that the wood may be hard in portions, and sufficiently close-grained and compact to be carved,—the fibre in mountain-cedars being finer than in those grown on plains. The wood is, however, generally described as a reddish-white light material, of a coarse grain and spongy texture, easy to work, but liable to shrink and warp. Dr Pococko affirms that it does not differ in appearance from white deal, nor does it seem to be harder. As a firewood, it is said to be inferior, burning quickly and evolving but little heat.

The cedar of Lebanon is cultivated in Europe for ornament only. It can be grown in parks and gardens, and thrives well; but the young plants are unable to bear great variations of temperature. According to Gilpin, the English cedar in its maturer age becomes shrivelled and deformed, the body increasing, whilst the limbs shrink. In the Botanic Gardens at Chelsea are two cedars, planted there in 1683, which have probably lived upwards of 200 years. At Caen Wood, Hampshire, are four trees which have been growing since 1756, and are as much as 100 feet in height. The first cedars in Scotland were planted at Hopetoun House in 1740; and the first one said to have been introduced into France was brought from England by Bernard de Jussieu in 1734, and placed in the Jardin des Plantes. Cedar-wood is earliest noticed in Leviticus xiv. 4, 6, where it is prescribed among the materials to be used for the cleansing of leprosy; but the wood there spoken of was probably that of the juniper. The term *Eres* (cedar) of Scripture does not apply strictly to one kind of plant, but was used indefinitely in ancient times, as is the word cedar at present. The term *arz* is applied by the Arabs to the cedar of Lebanon, to the common pine-tree, and to the juniper; and certainly the "cedars" for masts, mentioned in Ezek. xxvii. 5, must have been pine-trees. It seems very probable that the fourscore thousand hewers employed by Solomon for cutting timber did not confine their operations simply to what would now be termed cedars and fir-trees. Dr Lindley considers that some of the cedar-trees sent by Hiram, king of Tyre, to Jerusalem may have been procured from Mount Atlas, and have been identical with the *Callitris quadrivalvis*, or arar-tree, the wood of which is hard and durable, and was much in request in former times for the building

of temples. The timber-work of the roof of Cordova Cathedral, built eleven centuries ago, is composed of it. In the time of Vitruvius "cedars" were growing in Crete, Africa, and Syria. Pliny says that their wood was everlasting, and therefore images of the gods were made of it; he makes mention also of the oil of cedar, or *cedrium*, distilled from the wood, and used by the ancients for preserving their books from moths and damp: papyri anointed or rubbed with *cedrium* were on this account called *cedrati libri*. Drawers of cedar or chips of the wood are now employed to protect furs and woollen stuffs from injury by moths. Cedar-wood, however, is said by Dr Fleming to be injurious to natural history objects and to instruments placed in cabinets made of it, as the resinous matter of the wood becomes deposited upon them. *Cedria*, or cedar resin, is a substance similar to mastic, that flows from incisions in the tree; and cedar manna is a sweet exudation from its branches.

There are two sub-species or varieties of *Abies Cedrus*—*A. Deodara*, the deodar, or "god tree" of the Himalayas, and *A. atlantica*, of the Atlas range, North Africa. The deodar flourishes in all the higher mountains from Nepal up to Kashmir, at an elevation of from 5500 to 12,000 feet; on the peaks to the northern side of the Boorung Pass, it grows to a height of 60 to 70 feet before branching. The wood is close-grained, long-fibred, perfumed, and highly resinous, and resists the action of water. The foliage is of a grey-green, the leaves are slender, and the twigs are thinner than those of *A. Cedrus*. The tree is employed for a variety of useful purposes, especially in building. It is now much cultivated in England as an ornamental plant. *A. atlantica* has shorter and denser leaves than *A. Cedrus*; its wood also is hard, and more rapid in growth than is that of the ordinary cedar. It is found at an altitude above the sea of from 7000 to 9000 feet.

The name cedar is applied to a variety of trees. The Bermuda cedar (*Juniperus bermudiana*) and the red or American cedar (*J. virginiana*) are both much used in joinery and in the manufacture of pencils; though other woods are now superseding them for pencil-making. The Japanese cedar (*Cryptomeria japonica*) is a kind of cypress, the wood of which is very durable. Another species of cypress (*Cupressus thyoides*), found in swamps in the south of Ohio and Massachusetts, is known as the American white cedar. It has small leaves and fibrous bark, and is much used for making fences and coopers' staves. The Spanish cedar is a name applied to the *Juniperus thurifera*, and also to another species, *J. oxycedrus*. The latter was much used by the Greeks for making images; and its empyreumatic oil, Huile de Cade, is used medicinally for skin-diseases. A species of cypress which has been naturalized in the neighbourhood of Cintra is known as the cedar of Goa. The order *Cedrelaceæ* (which is entirely distinct from the Conifers) includes, along with the mahoganies and other valuable timber-trees, the Jamaica and the Australian red cedars. The cedar-wood of Guiana, used for making canoes, is a species of the Natural Order *Amyridaceæ*, *Icica altissima*.

The importation of woods classed as cedars into Great Britain has been free from duty since 1866, when the imports were 5647 tons, valued at £59,224.

CEFALU, a seaport town on the north coast of Sicily, in the province of Palermo, and 39 miles E.S.E. of the

town of that name, in 38° 0' N. lat. and 14° 4' E. long. The new town, founded by Roger I. of Sicily in 1131, is situated at the base of a steep promontory 1191 feet in height, which overlooks the magnificent Bay of Cefalu. The houses are tolerably well built; and the cathedral, commenced in 1132, is distinguished for the beauty of its façade, with antique pillars and mosaics. Near it are the bishop's palace and the seminary. The harbour is good, but small; and the trade, which is chiefly in oil, manna, and sardines, is inconsiderable. The inhabitants, who number about 10,200, are actively engaged in sea-fishery. The old town derived its name of *Cephalædium* or *Cephalædis* from the projecting headland mentioned above, on which it stood. On the original site are to be seen a fine Saracenic castle and an ancient temple. The latter is constructed of massive stones, and part of its walls is formed by the side of the hill. At first Cephalædium was possibly only a fortress of the Himereans. In 396 B.C. it entered into friendly relations with Himilco; and after the defeat of the Carthaginian fleet, it was betrayed into the hands of Dionysius of Syracuse. In 307 B.C. it was taken by Agathocles, and in 254, in the first Punic war, by the Romans. In 558 A.D. the town was captured by the Saracens.

CEHEGIN, perhaps the ancient *Segisa*, a town of Murcia in Spain, four miles east from Caravaca. Its houses are generally built of marble from the neighbouring quarries. Its civil, religious, and educational establishments are in a comparatively prosperous condition. It possesses a considerable trade in agricultural produce, especially wine, hemp, and oil, and has several manufactories of paper and coarse linen. Population, 6200.

CELANO, a town of Italy, in the province of Abruzzo Ulteriore and district of Avezzano, about seven miles east of the town of that name. It is finely situated on a hill about four miles from the former bed of Lake Celano, and has an interesting mediæval castle of the 15th century, celebrated for its connection with the unfortunate Countess Covella. Though the town never recovered from the vengeance inflicted on it in 1223 by Frederick II., it continued to be the centre of a countship which was bestowed in 1463 on Antonio Piccolomini. The chapel of this family, in the Convent of Valle Verde, not far from the town, is worthy of notice for the paintings of Giulio Romano; and the town itself has the honour of being the birthplace of Beato Tommaso the probable author of the *Dies Ire*. The population of the commune is 6673.

The neighbouring lake, known to the ancients as *Lacus Fucinus*, had till the beginning of this century an area of 37,990 acres, and was remarkable for its frequent changes of level. As early as the 1st century, the Emperor Claudius constructed a subterranean passage by which the surplus waters found an outlet to the Liris or Garigliano. No fewer than 30,000 workmen were employed for a space of eleven years; and the undertaking seems to have been as successful as it was bold. But in the following reign the passage was allowed to fall into disrepair; and it has been reserved to the present generation to see the old Roman works not only restored but surpassed. From 1793 to 1810 the lake had been gradually rising till it was 30 feet above its former level; and the attention of the Neapolitan Government was directed to the danger. Little, however, was effected till 1852, when the necessary works were undertaken by a company, under the direction of Mr C. Hutton Gregory, who proceeded to widen the emissarium and support the walls with arched work. The shares of the company were gradually bought up by Prince Giulio Torlonia of Rome, who successfully carried on the operations at his own expense till his death in 1871. About 36,000 acres of rich arable land have been reclaimed, and the corn-crops yield a profit of from 30 to 36 per cent.

The new tunnel is about four miles long, and has a cross section of 21 square yards. The honour of the engineering has been shared by Montricher, who died in 1858, Bermont, and Brisse. See Kramer, *Der Fuciner See*, Berlin, 1839.

CELEBES, an island of the East Indian Archipelago, separated from Borneo on the W. by the Strait of Macassar and bounded on the E. by the Strait of Molucca. It stretches from $118^{\circ} 30'$ to $125^{\circ} 40'$ E. long., and from $5^{\circ} 45'$ S. to $1^{\circ} 45'$ N. lat., and its area is approximately estimated at about 70,000 square miles. Its general outline is extremely irregular, and has been compared to that of a starfish with the rays torn off from the west side. It consists of four great peninsulas, extending from a comparatively small nucleus towards the N.E., E., S.E. and S., and separated by the three large bays of Gorontalo or Tomini, Tolo or Tomailki, and Boni. Of these bays the first is by

Map of Celebes (580 miles by 530).

far the largest, the other two having much wider entrances and not extending so far inwards. Most important among the smaller inlets are the bays of Amurang, Kwansang, and Tontoli on the north coast, Palos and Parre-Parre on the west, and Kendari or Vosmaer on the east. A large part of the island is but partially explored, but the general character of the whole seems to be more or less mountainous. Well-defined ranges prolong themselves through each of the peninsulas, rising in many places to a considerable elevation. Naturally there are no great river basins or extensive plains, but one of the features of the island is the frequent occurrence, not only along the coasts, but at various heights inland, of beautiful stretches of level ground often covered with the richest pastures. The substructural rocks are mainly of igneous origin, the most frequent being basalt in a state of decomposition; but in many districts the Carboniferous strata are well developed, and give a character to the landscape. The northern peninsula differs from the others in being still highly volcanic and subject to not unfrequent earthquakes. Within the province of Minahassa alone as many as eleven distinct volcanoes have been counted; and hot springs, mud fountains, and similar phenomena occur in several other districts. Few of the rivers are navigable for any distance, and the entrance to almost all of them is obstructed by

bars. Lakes, on the other hand, are both numerous and extensive. Of these the most important is the Tamparaung-Labaya or Tempe, situated in the south-eastern peninsula in $3^{\circ} 37'$ S. lat. It has a depth of about 30 feet, and is richly stocked with wild-fowl and fish. The scenery throughout the island is of the most varied and picturesque description. "Nowhere in the archipelago," says Mr Wallace, "have I seen such gorges, chasms, and precipices as abound in the district of Maros; in many parts there are vertical or even overhanging precipices five or six hundred feet high, yet completely clothed with a tapestry of vegetation." Much of the country, especially round the Bay of Tolo, is still covered with primeval forest and thickets, traversed here and there by scarcely perceptible paths, or broken with a few clearings and villages.
